**Giovanna Rossi**, Catholic University of Milan | [giovanna.rossi@unicatt.it](mailto:giovanna.rossi@unicatt.it)

This paper aims to provide a thorough reflection on the heterogeneity of cultural models and the variability of the family forms (pluralisation) that characterise contemporary society and therefore are also affecting the

cultural and social context of Italy. One of the most significant changes in family structure concerns couple formation: until a few decades ago this transition followed precise social norms, either explicit or implicit (falling in love,

engagement, religious marriage, birth of children). Today, however, in Italy, as well as in the rest of Europe, becoming a couple may occur in different ways. This contribution presents the results of the European Values Study 2008 ([www.europeanvaluesstudy.eu](http://www.europeanvaluesstudy.eu)), a large-scale, cross-national, longitudinal survey research program on basic human values. Findings concern the fourth wave of surveys, involving 47 countries and focused on an Italian sample consisting of 1,519 persons. Through a reflection on the morphogenetic process of the family based on the above data it is possible to reconstruct and analyse some patterns of

couple formation/dissolution, focusing on the currently married; separated/divorced with prior cohabitation; separated/divorced who currently live together; live-in partners; unmarried (singles), LAT - living apart together. The carried out analysis allows the understanding of the complex and wide-ranging transformations that have affected not only family structures and the couple formation process but also the meaning and values associated with the family itself. Finally the considered data set allows a diachronic comparison by which to answer the question of how attitudes to values changes with time.

## **Change and Preservation of Traditional Family Patterns over Three Generations: The Case of Arab Families**

Nasreen Haj-Yahia Abu-Ahmad, Sakhnin College | [nasreens@netvision.net.il](mailto:nasreens@netvision.net.il)

We present a study of three generations of Arab families aimed to examine change and preservation of family patterns: Mate selection and dating, marital age, birthing, gendered role division and decision-making, parent-child relations, and other family characteristics. We focus on Arab families in Israeli society, but the findings may also serve inform family researchers worldwide for who are interested to understanding patterns of change taking place among traditional families in other Western societies. In this study, we relied on modernization theory to explain the processes of change, and on intergenerational solidarity theory to explain preservation of family attitudes and patterns. Data were gathered from 537 Arab women belonging to 179 Muslim and Christian, both rural and urban. Findings indicate significant differences between generations in their couple and parental

relations. The younger the generation is, the less traditional are the attitudes and Behaviors. The factors found to promote change were the woman's education, work outside the home, intensive contacts with the Jewish population. The factor that was found to contribute most to the preservation of traditional patterns is consensual and associational solidarity between daughters and their mothers. We conclude that these forces operate in parallel, and that the younger generation differs from the traditional family as it is often portrayed. The findings will enable professionals to learn more about the characteristics of today's Arab family, contribute to reducing generalized and stereotypical perceptions of it, and to provide a culturally sensitive professional help to Arab families.

## a03RN13 - Fertility and Reproduction 2

Chair(s): Elisabetta Ruspini (Department of Sociology and Social Research - University of Milano-Bicocca)

### Men Anticipating Fatherhood in Spain

Maria Jose Gonzales, Universitat Pompeu Fabra, Barcelona | [mjose.gonzalez@upf.edu](mailto:mjose.gonzalez@upf.edu)

Marta Domínguez, Sciences Po | [marta.dominguezfolgueras@sciences-po.fr](mailto:marta.dominguezfolgueras@sciences-po.fr)

Francesca Luppi, Universitat Pompeu Fabra, Barcelona | [francesca.luppi@upf.edu](mailto:francesca.luppi@upf.edu)

Most studies on fertility behaviour have been primarily focussed on women. Men have often been deliberately ignored as if their opinions, expectations, uncertainties or desires did not matter at all for understanding couples' fertility. A main assumption remains whereby men preferences are kept constant over time, taking or granted that the rising cost of children does not matter for men's fertility intentions and that new gender roles do not alter men's desire for children. These assumptions, however, are no longer valid. There is growing evidence that a "new fatherhood" consisting of more involved and caring fathers is emerging in Western societies, while the image of the detached or "emotionally distant" father commonly associated with the traditional male-breadwinner settings gradually fades away.

This paper fills a gap in the literature by exploring the role of men in fertility decisions and the way in which they construct the notion of a "good father". The study is based on a subsample of first time expectant fathers in dual-earner couples in Spain (in depth interviews to 68 couples) conducted in 2011. The aim is to explore men's narratives about the importance of children in their life, their ideals about "good fatherhood" and their expectations about child care involvement and employment adjustments in the transition to the first child. This study also allows us to have a better understanding of men's preferred timing and best circumstances for fatherhood, which perfectly complements existing research on postponed parenthood and couples' low fertility behaviour.

### New Reproductive Actors? Men and Childbirth

Tina Miller, Oxford Brookes University | [tamiller@brookes.ac.uk](mailto:tamiller@brookes.ac.uk)

There is increasing research interest and recognition of men as 'partners in reproduction' (Lohan et al, 2011) as childbirth is anticipated in more shared and inclusive ways. This marks a change from men being traditionally portrayed 'as relatively unconcerned and unknowledgeable about reproductive health' (Dudgeon and Inhorn, 2004). But men's practices of agency in what have been (largely) maternal spaces can be tentative as they seek a role for themselves in the formal spaces of reproductive journeys.

Research has shown that men can feel ambivalent 'onlookers' or 'outsiders' in these spaces which are increasingly expected to accommodate men as paternal clients: and the professionals can feel similarly ambivalent about their presence. This paper will explore a group of fathers' experiences of preparing for and attending the birth of their first child in the UK. Through this focus it will examine the legacy of essentialist maternal assumptions and the ways in which gendered hierarchies, power relations and discursive displays shape

intentions and interactions in this arena. Attributes of hegemonic masculinities, for example power, stoicism and control are not associated with childbirth and the men navigate the prenatal period and the process of

birth in ambivalent ways. This paper will contribute to theorizations of men's gendered practices of agency as new paternal identities are contemplated and realised.

## **New Reproductive Possibilities? The Meaning of Parenthood among Non-heterosexual People in Great Britain**

**Robert Pralat**, University of Cambridge | [rp422@cam.ac.uk](mailto:rp422@cam.ac.uk)

The topic of lesbian and gay parenthood has received a lot of sociological attention, not only from scholars interested in sexuality but also from those studying families or reproduction. However, empirical studies have usually focused on how lesbian mothers and gay fathers engage in parenting beyond the nuclear family ideal (a married heterosexual couple with 'naturally' conceived children). As such, these studies have shed light on the unique experiences of lesbians and gay men embarking on pathways to parenthood previously unheard of. Still, little is known about how the idea of being a parent, and the different ways of achieving it, is perceived by non-heterosexual people without children. This paper discusses preliminary findings from an interview study of attitudes towards parenthood among young adult lesbians and

gay men in Great Britain. Using a narrative analysis, the paper explores how lesbian and gay non-parents in their twenties and thirties make sense of the 'new reproductive possibilities' and what meaning they ascribe to them. These individuals entered their adulthood when non-heterosexual parenting gained legal recognition as well as increased public visibility and acceptance, making this inquiry particularly timely. I argue that the ambivalence about being a homosexual parent and the general trend of delaying childbearing in society as a whole both contribute to putting the thinking about parenthood on hold. The findings also point to the selectivity of current discourses about lesbian and gay parenting and how it leads to a limited knowledge about it among lesbians and gay men themselves.

## **Becoming a Young Father: Sex and Relationship Practices and Values in the Life Trajectories of Young Men**

**Bren Neale**, University of Leeds | [b.neale@leeds.ac.uk](mailto:b.neale@leeds.ac.uk)

**Carmen Lau Clayton**, University of Leeds | [c.lau-clayton@leeds.ac.uk](mailto:c.lau-clayton@leeds.ac.uk)

Teenage pregnancy and early entry into parenthood has long been a concern of research and policy in the UK. Until recently the focus of attention has been on young motherhood; the life experiences and support needs of young fathers have been neglected. This paper reports on the Economic and Social Research Council's Following Young Fathers study (2012-15), which addresses this gap in knowledge, building on a baseline study funded

under the ESRC Timescapes Initiative. Using qualitative longitudinal methods and working collaboratively with practitioners and service providers, we aim to understand the life trajectories and experiences of a sample of 25 young men, and to gauge the scope and effectiveness of current service provision and state interventions in their lives. We focus here on the issue of why young men continue to enter parenthood despite a raft of UK policies

to reduce teenage conception and parenthood. The targets set for the Teenage Pregnancy Strategy (2000-2010) have not been reached, and impact has been uneven across the UK, indicating a mismatch between policy directives and the values and practices of young men. Based on data gathered from a sub sample of young fathers (aged 15 to 22) we explore their practices, values and experiences

concerning sex, intimate and familial relationships, contraception and abortion, and their perspectives on sex and relationship education, both formal and informal. We show how these intersecting dimensions of experience become implicated in their entry into parenthood. The paper concludes with a consideration of the policy implications of the findings.

## **b03RN13 - Balancing Family, Working Lives and Job Mobility 2**

Chair(s): Maria Letizia ML Bosoni (Department of Sociology - Università Cattolica di Milano)

### **Forging the Chain of Happiness. Polish Couples at the Life Course Transition to Parenthood**

Maria w Reimann, University of Amsterdam | [m.w.reimann@uva.nl](mailto:m.w.reimann@uva.nl)

In the time of crisis, high unemployment, and change of values, how do expectant Polish parents plan to divide work, childcare and housework after their first child is born? This presentation is based on 38 semi-structured interviews conducted with 19 Polish couples (men and women separately) expecting their first child. I interviewed well-educated, double-earner couples, in which both men and women work and value their career not only as a way to make money, but also as a way to live more interesting and satisfying life. Poland is a country under transition (from communism to capitalism, from traditional to more equalitarian ideals), and among others, the legislation regarding parental leave system and early childhood education is also

undergoing changes. So are the ideals of good motherhood and good fatherhood. The difficult situation on the labour market and very high unemployment among well-educated young people makes the decision to become parents even more difficult. The traditional ideal of "Polish Mother" (Matka Polka) contradicts with the new ideal of fulfilled career women. The new ideal of involved father is impossible to achieve while working very long hours, which is expected by most employers. In this paper I focus on the strategy that Polish expectant parents use to reconcile the ideals with what is possible in the given circumstances. I call it the chain of happiness and show how this chain - in which the mother is the most important and at the same time fragile ring - is forged.

### **The Impact of Work on Arrangement of Family - Or the other Way around?**

Swantje Reimann, University of Leipzig | [swantje.reimann@uni-leipzig.de](mailto:swantje.reimann@uni-leipzig.de)

Anja Pannewitz, University of Leipzig | [anja.pannewitz@uni-leipzig.de](mailto:anja.pannewitz@uni-leipzig.de)

In contrast to the high proportion of women in medical school only a few women are working in senior positions in clinical patient care and

medical research. Reasons for this unequal distribution may be manifold. On the one hand the German health care system is determined

by certain conditions, which are manifested in an increasing privatization and commodification. Such commodifications have a big influence on individuals behavior, too. The internalization of neoliberal imperatives by the individual can be seen in high flexibility, full mobility, constant availability, and other forms of efficiency, which are expected not only by employers but also by the employees themselves. These changing work patterns are also reflected in the design of family and role models. To balance the different value systems work (especially the appreciation of professional activity) and family life can be difficult and often only with a high use of energy. Based on theme-focused interviews

with female physicians and their respective partners, facilitative and hindering conditions are presented that illuminate the initial findings. Three couples will be presented as examples for different subjective responses to demands by working structures. These responses show the spectrum, such as under which circumstances families are constituted, role models are (re)staged and will be brought in line with job requirements. A tension between couples and families becomes apparent, that shows an importance of appreciation on a professional level and at the same time on a personal level with trying to integrate the two levels.

## **Determinants of Employment Trajectories during and after Single Motherhood in Great Britain and West Germany**

Hannah Zagel, University of Bremen | [hannah.zagel@zes.uni-bremen.de](mailto:hannah.zagel@zes.uni-bremen.de)

This paper investigates factors explaining why women in Great Britain and West Germany end up having a particular type of employment trajectory during and after they experience single motherhood. Looking at single employment statuses can only give a glimpse into the complex process in which individuals engage in economic activity. Here, the processual features of labour market involvement are emphasised and single motherhood is understood as a biographical event, which can act as a potential juncture for women's employment trajectory. The paper adds to existing research in the field of single motherhood and employment by considering that career trajectories following from single motherhood are parts of processes embedded in broader logics of life courses. Longitudinal survey data from the British Household Panel Survey and the German Socio-Economic Panel

(both 1991-2008) are used for the analysis of family characteristics, individual skill and occupational profiles as determinants of employment trajectories during and after single motherhood. The results of sequence analysis and regression analyses suggest that having a full-time employment trajectory during and after single motherhood is equally likely for British and West German women. However, experiencing single motherhood at a young age compared to later experiences is found to have negative consequences on labour market attachment, which seem to be better absorbed in the German than in the British context. Furthermore, in line with other research on work-family reconciliation and social stratification, having school-age children and working in a professional occupation facilitates full-time employment trajectories.

## c03RN13 - Processes of Family Dissolution and Reconstruction 1

Chair(s): Sabine Gründler (Bundesinstitut für Bevölkerungsforschung)

### Analyzing the Effect of Unemployment on the Well-Being of Spouses: Does Unemployment Increase the Risk of Partnership Dissolutions?

Frederike Esche, Humboldt University, Berlin | [frederike.esche@sowi.hu-berlin.de](mailto:frederike.esche@sowi.hu-berlin.de)

Even though it is obvious that unemployment is a temporary or long-term experience of many individuals, the sociological investigation about the impact of unemployment on partnerships seems to be elucidated and is potentially underestimated. Until now, numerous studies investigated the consequences of unemployment by analyzing its impact on the individual's well-being, showing a significant decrease in life satisfaction. Those endeavours have, however, mostly remained at the level of the unemployed person, thereby largely neglecting the impact of unemployment on other household members, like, for example, the partner. Furthermore, studies investigating the work-family interface and accounting for different social contexts and life domains an individual is integrated in, mainly only focused on employment related factors, thereby largely

ignoring the effects of unemployment. In order to close the gap, this paper asks if unemployment affects the life satisfaction of the unemployed as well as his/her partner and furthermore, investigates if unemployment increases the risk of partnership dissolutions. Using the longitudinal data of the GSOEP (1984-2011) and applying fixed-effects panel regression, findings show a significant decrease in life satisfaction for both partners even after controlling for several work-related as well as family-related factors. Furthermore, applying event history models, preliminary findings support the assumption that unemployment increases the risk of partnership dissolutions. Consequently, unemployment does not only matter for the society in terms of economical factors but also because of its harmful effects on partnerships.

### Bi-National Divorce Patterns in Portugal (2001-2010): A Comparative Analysis

Ana Cristina Ferreira, ISCTE-IUL, Lisbon | [cristina.ferreira@iscte.pt](mailto:cristina.ferreira@iscte.pt)

Sofia Gaspar, ISCTE-IUL, Lisbon | [sofia.gaspar@iscte.pt](mailto:sofia.gaspar@iscte.pt)

Madalena Ramos, ISCTE-IUL, CIES-IUL, Lisbon | [madalena.ramos@iscte.pt](mailto:madalena.ramos@iscte.pt)

Despite the increase on divorce rates in European countries during the last decades, research on bi-national divorces is still an under-researched topic. This is surprising since its study represents not only an important contribution to analyze the changes occurred within family structures and processes of migrant and non-migrant populations, but also to understand the level of social and cultural cohesion of couples with different ethnic origins. The aim of this paper is

to develop a comparative analysis of divorce patterns in Portugal between 1) two native Portuguese partners and 2) one foreigner partner previously married either to a native or to a non-native Portuguese spouse. This analysis will be based on official micro-data statistics from the National Institute of Statistics (INE, Portugal) in the period 2001-2010, and it will focus on socio-demographic information of the divorced partners (gender, age, nationality, education, occupational status, length of

marriage, type of marriage, and presence of children within the couple]. Even though the findings obtained by the data suggest the presence of a common pattern in those divorces of two native Portuguese and those with foreign partners, some particularities emerge from the data: marital disruption between foreign partners and Portuguese natives occur at younger ages in the life course

and in marriages of shorter duration. Additionally, an ethnic-specific analysis will be developed as to understand whether different divorce patterns occur among different ethnic groups. In light of these results, it will be discussed whether bi-national divorces are a symptom of lower levels of social and cultural cohesion between spouses of different ethnic origins.

## **Divorce in Multiple Equilibria. An Application to Germany, UK and USA**

**Daniel Bellani**, Universitat Pompeu Fabra (UPF) | [daniela.bellani@upf.edu](mailto:daniela.bellani@upf.edu)

**Diederik Boertien**, UPF | [diederik.boertien@upf.edu](mailto:diederik.boertien@upf.edu)

**Gosta Esping-Andersen**, UPF | [gosta.esping@upf.edu](mailto:gosta.esping@upf.edu)

**Abstract:** For many years now, divorce research has focused on the influence of women's new economic role. A number of studies show that divorce risks are associated with women's income. And, yet, there is also mounting evidence that the social gradient of divorce is being reversed. How does one reconcile such findings? In this paper we offer an alternative framework, based on multiple equilibrium models, that predicts that couple instability should be greatest where strong normative consensus is absent – i.e. in unstable equilibria. We should expect

significantly lower divorce risks in either the traditional family equilibrium or in a (possibly) emerging gender-egalitarian one. One important upshot is that research on family dynamics should be more sensitive to non-linearities. Using the GSOEP, the BHP and PSID waves 1986-2009; we apply discrete time event history analysis to couples and relate partnership durations to couple specialization. We focus particularly on inequity effects related to the division of domestic and market work.

## **d03RN13 - Families, Migration, Care and the Effects on Family Relationships 2**

Chair(s): Tina Miller (Department of Social Sciences - Oxford Brookes University)

## **Trends and Perspectives about Migration Processes and Families Experiences in the Italian Context**

**Isabella Crespi**, University of Macerata | [isabella.crespi@unimc.it](mailto:isabella.crespi@unimc.it)

For many years now immigration in Italy has been a hard fact. At times the main concern has been how to tackle emergency situations; at others, long-term decisions have been made

about integration policies and the construction of an increasingly multicultural society. In this context, Italian and international research alike confirm the central role played by the family in

the migration plans and strategies of individuals: that is, the decision to emigrate and which family members must or can do so. The family also takes on considerable importance in defining possible subsequent modifications, such as the length and development of the plan to emigrate. The natural transition process undergone by the family is accelerated: emigration alters marriage and couple models, ways of living together and forms of cohabitation. The aim of this presentation is to highlight the main trends of the migration process in Italy in the last decades, in relations to the migrant families experiences within the Italian context. In particular, will focus on some specific

issues: changing patterns of family migrations in Italy, migrant families formation transitions and life-course strategies, migrants and mixed families models, socio-economic indicators of foreign families experience, politics and policies for integration and families reunification. In particular it is possible to observe different behaviour related to gender (women and men migration) and generations (first and second generation of migrants). Last decades of migration processes in Italy showed the differentiation of families' strategies about integration. These aspects show the peculiarity of the Italian situation as regards the migration process as a family experience.

## **The Migrant Family is Different - But not just because of "Culture"**

**Michael Eve**, University of Eastern Piedmont | [michael.eve@unipmn.it](mailto:michael.eve@unipmn.it)

The specificity of the migrant family has traditionally been thought of in cultural terms (parents socialized in one country, children in another, "modern" vs. "traditional" upbringing, etc.). However, even independently of cultural differences (often oversimplified and nationalized as e.g. "traditional Algerian", "Vietnamese" etc. "culture"), there are good reasons to think that geographical moves have effects on family relations. It has been well documented that labour migration frequently involves long separations between mothers and children, between spouses and others. But I will present evidence suggesting that separations and subsequent reunions and re-combinations are a feature consistently linked

to migration (including internal migration), for a number of reasons linked to the migration process itself. Migration has major effects on networks and alters the network which is essential for the maintenance of family routines, care, and the domestic economy. Younger adult migrants are often separated from their own parents – and this often involves a significant re-organization of childcare. Moves have effects on exchanges with friends and neighbours, with consequences for domestic routines. This in turn has effects on roles of husband, wife, child. The paper will draw on interviews with international migrants and internal migrants in Italy to illustrate these changes.

## **School and Social Integration: Families of Ukrainian Origin in Portugal**

**Leonor Castro**, CIES/ISCTE-IUL, Lisbon | [leonorduartecastro@gmail.com](mailto:leonorduartecastro@gmail.com)

In the late 90s, appeared in Portugal an unexpected, abrupt and expressive immigration flow with origin in the Eastern European countries. If initially, the stay of these immigrants in Portugal could be seen as temporary, family reunification may be

indicative of an intention to return later to their country of origin or even fixation on national territory. This study reflects upon the integration of the families of Ukrainian origin in Portugal in several social spheres, with particular focus on school integration. Thus,

through the realization of interviews were analysed the representations that this group of immigrants has of the school and school knowledge, the monitoring practices that they develop, as well as how they maintain in contact with their cultural roots. The study tries also to identify their greatest difficulties of integration, as well as future expectations. The analysis of the collected information has allowed to understand that there are signs that many Ukrainian immigrants may not return to their country of origin. Some have already

bought a house in Portugal and were able to reduce the gap between their academic skills and the job they perform. Regarding the education of children, although some families remain very critical about Portuguese schools, they were able to identify some highly positive aspects and to recognize that at the end, the objectives and results are very similar and just have different methods. It was once again highlighted the importance of obtaining a school diploma in Portugal.

## Patterns and Trends of Bi-National Marriages in Portugal (1988-2011)

**Sofia Gaspar**, ISCTE-IUL, Lisbon | [sofia.gaspar@iscte.pt](mailto:sofia.gaspar@iscte.pt)

**Madalena Ramos**, ISCTE-IUL, CIES-IUL, Lisbon | [madalena.ramos@iscte.pt](mailto:madalena.ramos@iscte.pt)

**Ana Cristina Ferreira**, ISCTE-IUL, Lisbon | [cristina.ferreira@iscte.pt](mailto:cristina.ferreira@iscte.pt)

The growing weight of migrant communities in the last decades in Portugal has been accompanied by an indicator which suggests the increasing social integration of foreigner citizens into the Portuguese society - the rise of bi-national marriages. In a national context where the number of marriages has been declining, the relative importance of marriages where at least one of the spouses had born in another country has grown. Using a longitudinal perspective, this paper aims to describe, analyze and interpret the evolution of bi-national marriages in Portugal during 1988 and 2011. Some research questions will be addressed for this purpose: do migrants marry mostly within their ethnical group (homogamy), or do they tend to marry outside their communities (heterogamy)? Do different ethnical groups present different levels of

heterogamy? Do men and women exhibit different rates of bi-national unions? Are bi-national marriages structured according to equal educational and age resources? Data will be taken from official marriage micro data held by INE (National Statistics of Portugal), and it will privilege the analysis of some central socio-demographic indicators, such as, gender, year of the marriage, city of residence, place of birth, nationality, existence of common child, age of the partners, previous marital status, profession and education. This information will not only enable to create the longitudinal design of the main trends and patterns of bi-national marriages in Portugal, but it will also allow to understand who are the social actors (national and foreigner partners) taking part in these bi-national unions.

## a04RN13 - Social Policies and Family Intervention 1

Chair(s): Detlev Lueck (Federal Institute for Population Research)

### The Importance of the Family in Social Capital and the Welfare State: A Comparative Approach

Eric Widmer, University of Geneva | [eric.widmer@unige.ch](mailto:eric.widmer@unige.ch)

Olga Ganjour, University of Geneva | [olga.ganjour@gmail.com](mailto:olga.ganjour@gmail.com)

This report explores the links existing between the importance of the family for the social capital of individuals and the institutional context in which they live by using the heuristic distinction between bonding and bridging social capital. The data come from the International Social Survey Program (ISSP) from respondents living in countries classified in three groups according to Esping-Andersen typology: conservative regime countries (France, Germany and Spain), liberal regime countries (USA, Canada, Switzerland and Great Britain) and social-democratic regime countries (Denmark, Finland and Norway). Based on cluster analysis, we found that social capital developed by individuals to a significant extent depends on Social policy regimes. Individuals living in countries with a

conservative Welfare regime are involved in solidarity practices which are characterized by strong family ties. For norms of solidarity, they value the family as the main support provider. Individuals from social-democrat Welfare regimes are more frequently oriented towards State normative support and they more often focus on associations rather than on family ties. They benefit from a bridging form of social capital, in which family members are not the only resource providers. Individuals in the liberal Welfare regime more often develop ties through associations; at the normative level, they depend both on the State and the Family. Those results are discussed in a configurational perspective, which stresses the constraints imposed by macrocontexts on individual solidarity decisions.

### The Changes in the Russian Family State Policy: From Soviet Period to Modern Time

Antonina V. Noskova, Moscow State Institute of International Relations (MGIMO University) | [avnoskova@mail.ru](mailto:avnoskova@mail.ru)

The aim of the paper is to shed light on some peculiarities of family state policy in Russia and its influence on changes in family relations. The paper consists of three parts. In the first part, an evolution of family state policy in Russia is analyzed. We define here the family state policy widely enough as various state activity (ideological, legislative, economic, social) concerning the institute of family. The analysis of the state measures concerning the family in different social and political contexts allowed us to allocate five main periods and

models of family state policy in Russia. They are: post-revolutionary model (1917-1927), the «Stalin» model (1927-1954), «welfare» Soviet model (1955-1990), early post-Soviet model (1991-2005), modern model (since 2006). The second part of the paper is based on some demographic and sociological surveys data and devoted to an analysis of the family changes in these various periods. On the one hand, the family policies were reactions to new social requirements and demographic changes [decline of fertility, for example]. On the other

hand, the state activity concerning the family itself caused transitions in the family institute. We show how various measures of soviet and post-soviet family policies and public interventions in family life have influenced on

the family relations. The third part of the paper is focused on an important direction of the family policy concerning the child care public system. Its influences on gender and changes in the family care system are discussed.

## Challenges for Future Family Policies in the Nordic Countries

Ulla M Bjoernberg, Gothenburg University | [Ulla.Bjornberg@socav.gu.se](mailto:Ulla.Bjornberg@socav.gu.se)

In the framework of the Nordic welfare state model, the family was an important target for policies both regarding social equality and gender equality. During the last decades welfare policies are facing new problems with implications for families, children and the elderly. The paper will address how new challenges can be reconciled with the family policies that have been developed over the years in the Nordic nations of Denmark, Finland, Iceland, Norway and Sweden. Since the 1970s a neoliberal ideal for policymaking has swept over the world also in the Nordic countries. This has implied a critic of the role of the state regarding the extent to which the state regulates markets and socio-political

activities and individuals. In the Nordic countries the neoliberal way of thinking and of managing policies since the 1980s moved the discourses and governance towards an increased focus on deregulation and privatisation thus emphasising individual choice and responsibilisation, market solutions to social services. These changes are represented in a wide variety of policy areas like social policy including care policy, labour market policy. In the paper I will address the following questions: Which problems are not sufficiently met? Which rights should be defended? Which priorities tend to undermine previous objectives set up for family life?

## Crowding In and Crowding Out: An Analysis of European Households Public and Private Transfer Receipts Using EU-SILC 2007-10

Thomas E Emery, University of Edinburgh | [temery86@gmail.com](mailto:temery86@gmail.com)

The financial crisis has seen the youth unemployment in the European Union increase to 24% (Eurostat, 2013). This, coupled with state retrenchment, has increased the burden on private means of support such as the family. The crowding out hypothesis says that increasing state benefits will 'crowd out' family support. At a time when state support is being reduced in many countries as part of various austerity programs, this analysis asks whether the crisis has seen an increase in private financial transfers. This paper tests the Crowding Out hypothesis using data from the European Union's Statistics on Income and Living Conditions. Using household data on public and private transfer receipts, the paper

argues that there is little evidence for the crowding out hypothesis and that individuals in receipt of public transfers are no less likely to receive private transfers. Multilevel event history analysis is used to control for various factors but the methods remain restrictive and limitations are discussed. The analysis also considers the possibility that the effect is heterogeneous across different policy forms and in different welfare regimes and multilevel methods are adopted to test this. Preliminary evidence is found to suggest that certain social policies such as child benefits and educational allowances 'crowd in' informal transfers. Conversely social policies associated with labour market activity are shown to have no

noticeable effect on the likelihood of receiving an informal transfer.

## **The Status and the Importance of the Cooperation of University- Non-Governmental Organizations in the Development of Solution Strategies for Family Issues in Turkey**

**Abulfaz Suleymanov**, Uskudar University | [asuleymanov@yahoo.com](mailto:asuleymanov@yahoo.com)

This study examines the status and the importance of sociology and social work departments in the development of solution strategies for family issues in Turkey. In this study in which the information has been gathered by survey method, the sociology and social work departments of the universities in Istanbul have been examined. The findings obtained have showed that the above-mentioned departments of the universities have actively taken part in developing solution strategies for family issues in an indirect way

and have made an active contribution to this process through the instrument of some institution carrying in out scientific-practical studies like especially recently established family consulting centers. However, it was determined that social work departments of the universities by comparison with the sociology departments have taken an active role in the development of solution strategies for family issues and in cooperating with non-governmental organizations accordingly.

## **b04RN13 - Family and Gender Roles 1**

Chair(s): Vida Kanopienė (Department of Sociology - Mykolas Romeris University)

## **How to be a Dad in Poland? Fathering in Times of Changing Gender Roles and Family Models**

**Katarzyna Suwada**, Polish Academy of Sciences, Warsaw | [k.suwada@gmail.com](mailto:k.suwada@gmail.com)

The main aim of my paper is to answer the question how young Polish fathers define and understand their parental roles. Polish society provides characteristic, yet not the best, conditions for having children. Despite the changing model of families in everyday life, the Polish family policy is still very conservative and forces women to stay home for a longer period of time; fathers can have only 2 weeks of paid paternity leave whereas mothers are entitled to 20 weeks of paid maternity leave. There are not enough places at the kindergartens for all children. Besides, there are influences in Polish societies of the Catholic Church, which strongly criticized the

concept of gender and changes in family life. Many Polish politicians agree with this statement. In the face of those facts among Polish fathers there are very different views on parenthood. Some of them really struggle with the stereotypical view of fatherhood imposed by the socio-institutional context and try to be as much involved in their children's lives as their mothers. Part of them keeps to the conservative model in talking whereas in really life they tend to cross gender roles. There are also some who identify only with the stereotypical breadwinner role. In my paper I will present how Polish fathers define parental roles and understand the gender equality

concept. All my conclusions are based on my research – 50 in-depth interviews with Polish parents conducted in 2012/2013. They are

comparatively analysed with fathering in Sweden.

## Division of Childcare and Domestic Tasks by Fathers on Paternity Leaves in Spain

Pedro Romero-Balsas, Autonomous University of Madrid | [pedro.romero@uam.es](mailto:pedro.romero@uam.es)

This paper is framed in a wider research Project called “The Social Use of Parental Leave in Spain” (CSO2009-11328) funded by the Spanish Ministry of Science and Innovation. Paternity leave is one of the policies aimed at balancing work and family life, along with the main objective of balancing gender divisions in the productive and reproductive spheres. However, paternity leave is also an option for fathers to balance work and family life after childbirth. Therefore, paternity leave could be more actively sought by fathers who have more egalitarian gender roles. We have analysed the ways in which two different household tasks are shared: 1) Domestic tasks, which include cleaning, shopping, cooking and doing the laundry; and 2) Childcare tasks, which include doing the school run, keeping an eye on their children, bathing them, playing with them and looking after them. The main hypothesis states

that the more the more egalitarian gender division the fathers have, the higher their take up of paternity leave is. This paper uses a quantitative approach based on the database of the survey “The Social Use of Parental Leave 2012”. This survey data are representative at national level. The sample consists of 4000 people aged from 25 to 60 years old with children that at the moment of the survey were under 13 years old. The fieldwork was carried out between January and March 2012. The sample used for this paper is composed by 600 fathers who have had at least one child since 2007. The statistical technique implemented is logistic regression. The preliminary findings point out that more egalitarian gender division tasks encourage fathers to take paternity leave. However, the division of childcare tasks seems to have no effect.

## Men’s Strategies in Relation to Household Chores – Organization, Interaction and Gendered Power in a Swedish Context

Lasse Reinikainen, Mid Sweden University | [lasse.reinikainen@miun.se](mailto:lasse.reinikainen@miun.se)

Sweden is considered to be one of the most gender equal countries in world, but women are still doing most of the household chores. The aim of this paper is to study men’s strategies to avoid household chores. These strategies are not always results of conscious choices, but rather they are made possible by a gender order which allow men a greater scope of action than women. The study is based on in-depth interviews with 10 Swedish heterosexual middle-class couples that were interviewed both as a couple and as individuals. The point of departure for the analysis is that the couples’ everyday practices,

relations and decisions are influenced by processes on three levels: a structural level (labor market, family policy etc), a cultural level (conceptions of gender, love, family etc), and finally a social level where the concrete interactions between individuals occur. These levels are in constant interplay and can create contradictory demands and expectations for individuals. It is in this context that negotiations and decisions regarding the distribution of household chores takes place. Some examples of the strategies mentioned above involves referring to ‘the male role’ and ‘womens’ greater competence (regarding

household chores). Another result of the study is that the person with chief responsibility for the planning of chores also does more of the

work, partly because they know what has to be done, partly because they don't want to end up becoming 'a boss' for their partner.

## Fathers on Leave Alone and Gender Equality

Karin Wall, University of Lisbon | [karin.wall@ics.ul.pt](mailto:karin.wall@ics.ul.pt)

Sofia Marinho, University of Lisbon | [sofia.marinho@ics.ul.pt](mailto:sofia.marinho@ics.ul.pt)

Mafalda Leitão, University of Lisbon | [mafalda.leitao@ics.ul.pt](mailto:mafalda.leitao@ics.ul.pt)

Over the last two decades in Western societies there has been a continuing enhancement of fathers' entitlements to leave in order to increase men's participation in the care of their newborn children. Depending on eligibility criteria and type of leave scheme, fathers may be on leave at the same time as the mother or alone after the mother returns to work. Despite the significance of this development and the diversity of entitlements, little is known about men who take leave "alone" and the consequences of this care leave for fathers and gender equality in family life. The experiences and conceptualizations of fathers caring alone

were explored through a qualitative study using a purposive sample of 15 Portuguese fathers who recently took leave alone for at least thirty days. Lived experiences are diverse but all emphasize the specific impact of being on leave alone and six key processes related to the experience: negotiating, caregiving, learning, bonding, undoing gender roles and experiencing emotions. From a policy perspective, findings suggest that there are significant differences between leave schemes promoting family time and those encouraging father's time alone with a newborn child.

## Flexible Fathering

Kristine Warhuus Smeby, NTNU, Trondheim | [Kristine.Smeby@svt.ntnu.no](mailto:Kristine.Smeby@svt.ntnu.no)

Globally, Norwegian men are in an exceptional position. Becoming fathers, they are granted 12 weeks of paid leave to stay home and take care of the baby. Most fathers use this right. The father's quota has gradually been extended and fathers increase their leave accordingly. Why so many Norwegian fathers make use of this right may partly be explained by the flexibility within the arrangement; the father may take 12 weeks leave in one stretch while the mother either is at work or at home, he may divide it into smaller units over a longer period or delay it all together. This flexibility makes it possible for most fathers to take leave, but at the same time the potential

for gender equality seems not to be fully explored when fragmented. This paper is based on individual interviews with fulltime working parents where fathers have made use of their father's quota. I want to discuss how the father's use of the flexibility may give different consequences for gender equality at home. The effect is not the same whether the father is at home with the baby one day a week versus having continuous responsibility for child and home for 10 weeks in a stretch. After 20 years of father's quota in Norway it is now time to reflect upon how it is used and the impact this flexibility might have on gender equality.

## c04RN13 - Processes of Family Dissolution and Reconstruction 2

Chair(s): Sabine Gründler (Bundesinstitut für Bevölkerungsforschung)

### Who Finds a Partner? Reconstitution of Partnership after Divorce in Eastern Europe

Ausra Maslauskaitė, Vytautas Magnus University | [amaslauskaitė@ktl.mii.lt](mailto:amaslauskaitė@ktl.mii.lt)

The paper examines socio-demographic and economic factors that affect the repartnering after the first divorce in six Eastern European countries. On general repartnering in Europe is widely understudied and this is even more true for the Eastern European countries. The study of repartnering is relevant for several reasons. First, it unveils the advance of the deinstitutionalization of family in the society. Second, it helps to better understand the "marriage market". And third, it is relevant for the study of the mitigation of the negative economic consequences of divorce for women and children, because the new partnership is a strategy to overcome the economic hardship. Previous studies from USA and Europe proves that repartnering is a selective process but the findings on demographic and economic effects are inconsistent, vary across the space and are gender specific. In this paper we analyze how

the chances to start a new partnership after divorce are distributed within each society and across the societies. Could we distinguish common patterns in repartnering and accordingly similarities in "marriage markets"? What is the prevailing type of partnership after divorce (marriage or cohabitation) and do countries converge in regard to this? How the socio-demographic and economic factors affect the type of partnership entered? The study is based on the large scale data set "Generation and Gender Survey" with the complete retrospective histories of partnership formation and dissolution. The countries included into analysis are Bulgaria, Estonia, Hungary, Lithuania, Romania and Russia. The competing risk event history models of analysis are employed.

### Factors Influencing Women's Lives after Partnership Break-Up and the Impact of Break-Up on Women

Marta Vohlidalova, Academy of Sciences of the Czech Republic | [marta.vohlidalova@soc.cas.cz](mailto:marta.vohlidalova@soc.cas.cz)

Czech Republic is among countries with the highest divorce rate in the EU - around 50% of marriages end in divorce, 56% of which are marriages with dependent children. Studies have shown that divorce and especially divorce in families with children, is a turning point in life stories, forcing people to adapt to a new life situation and to revise the practice of breadwinning and caring roles between ex-partners. In my paper I will focus on two research questions: i) What factors in women's

life biographies appear to be crucial for successful coping with post-divorce or post-break-up situations in the CR? ii) How do women themselves interpret and evaluate the impact of divorce and separation on their life from their current perspective? The paper is based on the qualitative analysis of 14 biographical interviews with mothers who broke-up with or divorced their partner and were granted child custody. The analysis suggests that the life stories of women after

divorce or break-up are influenced by numerous structural inequalities – e.g. by gender relations in family, family policy setting and especially by discrimination on the labor market. Within this context, their room for

maneuver is often highly limited, and the conditions under which their decisions are made are not too friendly to their particular life situations.

## Marriage Dissolution during and after Socialist Times – A Comparison between Romania, Bulgaria and Hungary

Mihaela Haragus, Babes-Bolyai University, Cluj-Napoca | [mihaela.haragus@ubbcluj.ro](mailto:mihaela.haragus@ubbcluj.ro)

We investigate divorce during and after the socialist regimes in three Eastern European countries (Romania, Bulgaria, Hungary), with a focus on the role of social status. We test Goode's hypothesis that states a positive relation between social status and divorce in a society where there are high legal, social and economic barriers to divorce. As these barriers gradually fade, so does the mentioned positive relation and divorce becomes more common in lower classes. We investigate the first time married women and their marriage dissolution and we perform event history analysis. We use several covariates as proxies for social status: educational status (at marriage), father's social status, residence during childhood (urban vs. rural), as well as other control variables. We expect to find a positive association of social

status and marriage dissolution during socialism, and a weakening of this relation afterwards. We expect the positive gradient to be strongest for socialist time Romania, where the divorce legislation was the most restrictive, compared with other two countries. We have found positive social gradients of divorce risks for Romania and Bulgaria during socialist times, but none for Hungary. In the post-socialist period, the link between social status and divorce risk loses its significance in Romania, while in Bulgaria an opposite relation emerges. The social gradient of divorce becomes negative there: low educated women, born and raised in rural settlements show the highest divorce risks. In Hungary, the situation looks very similar in both periods.

## a05RN13 - New Findings 1

Chair(s): Giovanna Rossi (Family Studies and Research University Centre - Università Cattolica di Milano)

### Sibling Similarity in Family Formation

Marcel Raab, Social Science Research Center Berlin (WZB) | [marcel.raab@wzb.eu](mailto:marcel.raab@wzb.eu)

Anette E. Fasang, Humboldt University Berlin and Social Science Research Center Berlin (WZB) | [fasang@wzb.eu](mailto:fasang@wzb.eu)

Jani Erola, University of Turku | [jani.erola@utu.fi](mailto:jani.erola@utu.fi)

Aleksi H.S. Karhula, University of Turku | [aleksi.karhula@utu.fi](mailto:aleksi.karhula@utu.fi)

Sibling studies have been widely used to study the effect of family background - everything

siblings share - on socioeconomic and demographic outcomes. We contribute to this literature by combining the sibling design with sequence analysis to study family related behavior. This design acknowledges that fertility and partnership transitions are embedded in a holistic process that unfolds over time. At the same time it allows studying effects of the family of origin on the offspring's family formation by comparing sibling dyads and dyads of unrelated persons. Several mechanisms that potentially generate sibling similarity in family formation are considered: similarity as a by-product of status transmission, value socialization, parental social control, and mutual sibling influence. We use Finnish register data from 1987 until 2007 to construct family formation sequences for sibling dyads and unrelated dyads from age

18 to 30 (N=14,259 dyads). The empirical analysis employs (a) conditional assignment to construct an analysis sample of sibling dyads and comparable unrelated dyads, (b) sequence analysis to measure similarity in family formation, (c) dyadic regression analysis to identify the determinants of similarity in family formation, (d) cluster analysis to examine whether siblings are concentrated in specific family formation patterns. Findings show that siblings' family formation is indeed more similar than family formation of unrelated dyads, even after controlling for a variety of parental background and socioeconomic characteristics. We conclude that sibling similarity in family formation is primarily a by-product of status transmission and a result of gendered value socialization.

## **The Salience of Kinship: Personal Networks and Biographies and Family Values in Three Cohorts of Portuguese**

Rita C Gouveia, University of Lisbon | [rittadocarmo@gmail.com](mailto:rittadocarmo@gmail.com)

Eric Widmer, University of Geneva | [eric.widmer@unige.ch](mailto:eric.widmer@unige.ch)

Ongoing debates over modernization on personal relationships anticipate the decline of kinship and informal solidarities associated with modifications of community and family ties due to urban and industrial development on the late twentieth and early twenty-first centuries. However, these assumptions have been criticized, arguing that instead of this decline, we witness a reconfiguration of traditional forms of primary relationships toward electivity. Modernity theories explain these shifts in direction to the "pure relationship", based on the exercise of choice and higher reflexivity of individuals on the construction of their relational world and to construct their biographies. Our hypothesis is that modernization, and its implications on personal relationships, stem from changes in social structures, family values, and due to the

pluralization of lifecourses. In order to test this hypothesis, we use a large and representative data set of 1500 individuals living in Portugal. We compare the composition of personal networks between and within three birth cohorts of Portuguese born between 1935-1940, 1950-1955; and 1970-1975, who made the transition to adulthood in different social and historical times, and who are experiencing different life transitions. Our hypothesis is that modernization effects reveal cohort differences in terms of non-kin salience. Results show that younger cohorts indeed give a lower importance to kin. However, these effects are explained primarily by changing sets of biographical conditions, and secondarily by value changes and structural contexts. Results are discussed within the configurational perspective on families.

## Multichannel Sequence Analysis Applied to Family and Occupational Trajectories as Structuring Factors of Personal Networks

Jacques-Antoine Gauthier, University of Lausanne | [jacques-antoine.gauthier@unil.ch](mailto:jacques-antoine.gauthier@unil.ch)

Gaëlle Aeby, University of Lausanne | [gaelle.aeby@unil.ch](mailto:gaelle.aeby@unil.ch)

The personal network of an individual is composed of her/his friends and relatives and represents a major source of relational support. However little is known about how these networks of personal relationships are built over time? Part of the social capital stems from members of the family of orientation, whereas other parts are acquired during years of education, work experiences, as well as through friend and intimate relationships. Some of these resources are available all life long and others are just temporary activated. Moreover, evidence shows that patterns of family and occupational participations are highly interdependent. The form of the social capital available to individuals is hence not only dependent on multiple contexts, but also on time. Drawing from the life course literature, we hypothesize that present personal

relationships are influenced by past and on-going life experiences. Using survey data representative for the Swiss resident population, multichannel sequence analysis followed by cluster analysis allows creating bi-dimensional typologies of simultaneous social participation (family and occupation). Then, eight types of personal configurations based on the composition of inter-individual ties are identified. These constructions allow evaluating the influence of time related multiple social participations on the present composition of personal relationships. First results reveal various types of simultaneous social participation according to gender and social position, normative models of participation being more likely associated with personal configurations centered on the nuclear family members.

## A Labour of Love? Interrogating the Meanings and Practices of 'Relationship Work' in Couples' Long Term Relationships

Janet Fink, Open University | [janet.fink@open.ac.uk](mailto:janet.fink@open.ac.uk)

Jacqui Gabb, Open University | [Jacqui.Gabb@open.ac.uk](mailto:Jacqui.Gabb@open.ac.uk)

The sociology of families and personal relationships has a rich and dynamic history, out of which have developed multidimensional methodological and analytical lenses through which the complexity of these public-private domains has been interrogated. In turn analysis has shifted from function to form to everyday practices with particular attention being directed onto the interiority of personal life. In this paper, however, we want to reorient the analytical lens and to argue that the concept of 'relationship work' can shed new light on understandings of personal relationships. Our discussion will draw on data from an ESRC-funded project (RES-062-23-

3056) Enduring Love? Couple relationships in the 21st century. The project includes a survey and sixty qualitative mixed methods interviews with heterosexual and same sex couples, spanning three generations. Like Kipnis (1998) our analysis takes a long view, drawing upon 19th century theories of labour and capital, 20th century feminist critiques of domestic labour, emotion work and reproductive labour as well as more recent therapeutic arguments that good marriages take work. The focus is upon the everyday practices that couples do to sustain their relationships and the material conditions which shape these personal lives. Our conceptualisation of 'relationship work'

thus inculcates ideas of work, capital, the social and culture while simultaneously keeping a keen eye on the intensity of emotions. Thus, rather than erase feelings and

affect from the psycho-social lens, we argue that it situates relationships in context. L.Kipnis (1998) 'Adultery', in *Critical Inquiry*, 24 (2) 289-327.

## **b05RN13 - Fertility and Reproduction 3**

Chair(s): Vida Kanopienė (Department of Sociology - Mykolas Romeris University)

### **Post-Modernisation of the Family in Spain. A Sociological Study about Adoptive Families and their Lifestyles**

María-José Rodríguez-Jaume, University of Alicante | [mj.rodriquez@ua.es](mailto:mj.rodriquez@ua.es)

Diana Jareño-Ruiz, University of Alicante | [diana.jareno@ua.es](mailto:diana.jareno@ua.es)

The phenomenon of international adoptions, which appeared with some delay in Spain compared to our European neighbouring countries, is now developing with an intensity that has no parallel on an international level. The journey towards the 'sociology of adoption' in Spain has only just begun, though. The phenomenon of adoptions has only been incorporated timidly and with disparate objectives into Spanish sociological surveys so far. The scarce sociological research carried out in Spain about this phenomenon shapes the future academic agenda. One of the pending issues is the reflection and conceptualisation of adoptive families as a terminological and social reality. The survey 'Adoptive families and their lifestyles,' precisely designed for the purpose of undertaking a sociological analysis

of adoptive families, is placed within the framework of the research project 'The (baby) boom of international adoptions in Spain' (R&D&I 2008-2011). The impossibility of having a sampling frame of adoptive fathers and mothers led us to administer the survey online. Nineteen adoptive families' associations together with several research centres and institutes collaborated with us in this task. The final sample is made up of 230 adoptive families. This presentation has as its aim to show the data corresponding to the analytical dimensions included in the survey: socio-demographic characteristics; the path towards the adoptive family; the inter-racial and multi-ethnic family; and ideas and values around the family.

### **Bodywork and the Global Market in the 21st Century: How Surrogacy Broadens Consumer Choice and Responsibility**

Ingvill Stuvøy, Norwegian University of Science and Technology (NTNU, Trondheim) | [ingvill.stuvoy@svt.ntnu.no](mailto:ingvill.stuvoy@svt.ntnu.no)

The emergence of a global surrogacy market has provided involuntary childless singles or couples with new opportunities to get the wished-for child and desired family. In Norway,

this implies moreover a way of circumventing the ban on surrogacy. Stories of Norwegians travelling abroad to use surrogacy have caused heavy media attention and debate; with

marketization of reproduction, pregnancy and babies being a main concern. In this paper, I propose a focus on surrogacy as an economic practice. This provides an opportunity to examine how understandings of pregnancy, as a type of bodywork, and babies, as the “product” of surrogacy, are affected by the intermingling of money and economic logics with reproduction and intimate lives. To date, much emphasis has been put on the (lack of) choices available to the surrogate mothers. However, I argue the relevance of approaching also the choices of the consumers in this

surrogacy market. How do cultural ideas and values, as well as social-structural relations affect and shape the way consumers make choices in the surrogacy market, and moreover, come to conceive this specific market? And could surrogacy be conceived as broadening both consumer choice and responsibility – and if yes, how? Approaching these questions, I seek in this paper to contribute to economic sociology, consumer research, as well as feminist theorizations of intimate lives, bodies and markets.

## Fertility and the Transformation of Parenthood in Ireland

Jane Gray, National University of Ireland, Maynooth | [jane.gray@nuim.ie](mailto:jane.gray@nuim.ie)

Ruth Geraghty, National University of Ireland, Maynooth | [ruth.geraghty@nuim.ie](mailto:ruth.geraghty@nuim.ie)

While still having one of the highest fertility rates in Europe, Ireland nevertheless experienced a rapid decline in completed fertility from very high levels at the beginning of the last century, especially amongst women born since the 1950s. Ireland’s fertility transition was both late and compressed – insofar as the changes associated with the ‘second’ demographic transition overlapped with those associated with the first. Ireland thus represents an interesting case study for evaluating competing explanations for declining fertility, including changes in the motivations, meanings and experiences surrounding parenthood, as well as the challenges associated with increased labour force participation on the part of women, and lagging change in the wider institutional environment. This paper will explore how long-

term changes in the social construction and experience of parenthood were related to decisions about family formation, drawing on two major qualitative databases that allow us to focus make comparisons across four birth cohorts. The ‘Life Histories and Social Change’ database includes life story interviews with respondents in three broad birth cohorts: <1935, 1945-1954 and 1965-1974. Qualitative interviews with parents from the ‘Growing Up in Ireland’ project (a national panel study) allows us to compare and contrast retrospective memories of becoming a parent with contemporary experiences. Together, the datasets provide a unique opportunity to investigate the experiences and ‘moral rationalities’ that framed changes in decision-making about becoming a parent from the beginning of the last century to the present.

## Different Cohorts Means Different Meaning of Parenthood? The Case of Portugal.

Lídia P. Tomé, University of Évora | [lidiap\\_tome@hotmail.com](mailto:lidiap_tome@hotmail.com)

Maria F.F. Mendes, University of Évora | [mmendes@uevora.pt](mailto:mmendes@uevora.pt)

In 1984 Lídia was born somewhere in Portugal, and in that year were born, on average, 1.9 children per woman. Portugal was still 2 years

far from the E.E.C., 18 years far from the EURO. Lídia’s mother, the youngest of seven brothers and sisters, was born in 1965, ten

years before the end of the dictatorial regime, and in a year with an average of 2.25 children per woman. The women born in the 1965 cohort had low educational attainment, but already high employment rates. Later in 1989 when Lídia arrived to the school her class had 25 students, from that group only 5 of them, including her, remained today without any siblings. Also from these 25 students in the classroom and born in the cohort of 1984, 10 have a university degree and 3 have today at least one child. What changed between cohorts that diminish the number of births? Is Portugal a particular situation, is only a transitory moment of postponement, or is a logical

consequence from the socio and economical context? Does the fertility decline result of changes in the parenthood definition? Is important to recognize that fertility decline is possible cause-effects between the deep impact of massive education, high female labour market participation and a redefinition of parenthood. The objective of this study is to investigate and explain the transitions to motherhood as well as transitions to the second birth, providing new insights between period and cohort fertility, parenthood, educational attainment and labour market participation.

## c05RN13 - Balancing Family, Working Lives and Job Mobility 3

Chair(s): Elisabetta Carrà (Family Studies and Research University Centre - Università Cattolica di Milano)

### Work–Family Tensions and the Financial Crisis

Johanna Lammi-Taskula, National Institute of Health and Welfare (THL), Finland | [johanna.lammi-taskula@thl.fi](mailto:johanna.lammi-taskula@thl.fi)

Minna Salmi, National Institute for Health and Welfare (THL), Finland | [minna.salmi@thl.fi](mailto:minna.salmi@thl.fi)

The balancing of work and family takes place in the context of globalising economy. The financial turbulence that started in 2008 has created insecurities in the economy and labour market which have impacts also for families with children. Risk of unemployment and cuts in the public services and social benefits create additional burdens for parents who try to cope with their everyday family life. In this paper, we study the impact of the ongoing financial crisis on tensions between work and family life in Finland. We compare experiences of mothers and fathers in two different points of time: before the crisis, and in the middle of it. The

analysis is based on two waves of a survey conducted in 2006 and in 2012. We present findings of mothers' and fathers' experiences of work–family tensions (lack of time, worry about coping, neglecting family matters because of work, and quarrels about housework) with children under school age as well as with school-aged children. The samples were randomly selected from a national family register of Statistics Finland. Both waves reached a response rate over 50 % and comprise about 1800 mothers and 1100 fathers.

## Work-Family Conflict and Mental Health in Newlywed and Recently Cohabiting Couples: A Couple Perspective (APIM)

Sara A. A. Symoens, Ghent University | [sara.symoens@ugent.be](mailto:sara.symoens@ugent.be)

Piet F. Bracke, Ghent University | [piet.bracke@ugent.be](mailto:piet.bracke@ugent.be)

'Work' and 'life' can be important sources of tension and conflict, leading to a decrease in the quality of life. Especially for young, dual-earner couples it's a challenge to find a satisfying balance between both. Moreover, because men and women in couple relationships are interdependent, a mutual influence of spillover effects between partners may exist. In this article, the impact of (negative) spillover from work-to-family and family-to-work on distress (i.e. feelings of depression, CES-D8) is studied from a couple perspective, using an Actor-partner interdependence model (APIM). At special interest are differences in the dynamics between men and women, and between married and cohabiting partners. The data of newlywed and recently cohabiting couples of the RIF 2010 survey (Relationships in Flanders) are used (Nmarried couples= 376, Ncohabiting

couples= 344). Structural Equation Modeling (SEM) is conducted within Mplus. Results show that for both men and women, both work-to-family and family-to-work spillover are experienced as major stressors. In line with gender role theories, overall, men seem somewhat more sensitive for tensions resulting from family interfering with work, while women are more affected when work interferes in the family (actor-effects). Women feel also more distressed when their partner experiences more work-to-family spillover. For men, no significant crossover effects were found (partner-effects). Finally, interesting differences appeared when comparing the married with the cohabiting, revealing underlying differences in priorities and the impact of relationship (un)certainty. Results are discussed. Suggestions for further research are made.

## Tensions between Studies, Work and Family-Life. A Case Study

Jukka Niemelä, University of Tampere | [jukka.niemela@uta.fi](mailto:jukka.niemela@uta.fi)

Most research on work-life balance has focused on the interface between work and family life and is based on role theory. Some scholars have proposed the need to broaden the debate beyond the role theory and the domains of the family life and work. In this paper I study the balance between studies, work and family-life among university students. Some of them are occupied with three domains (work, family and studies), others with two (studies and work) or only with one domain, studies. I analyze how different kind of students manage to reconcile life domains and what kind of consequences the imbalance between life domains has on well-being. According to role-conflict theory and the scarcity argument, engaging in multiple roles

means competition between life domains and thereby causes psychological distress and role strain. The traditional role-conflict theory and scarcity arguments dominated the research until 1990s. Recently research on work-life balance has begun to utilize new version of the role theory, the enhancement theory, and the decision process theory of work and family and the theory of work-family dynamics. The empirical data of the paper is derived from a survey conducted in 2011 in two Finnish university consortia. Half of the respondents experienced imbalance between studies, work and family life. The imbalance is most strongly associated with role-conflicts between studies and family life and less with conflicts between work and studies. The results are to some

degree out of tune with the traditional role conflict theory and scarcity argument. As a whole the results accord more with the

enhancement theory, the decision making theory and the theory of work-family dynamics.

## Balancing Family and Working Lives in Italy

Sara Mazzucchelli, Catholic University of Milan | [sara.mazzucchelli@unicatt.it](mailto:sara.mazzucchelli@unicatt.it)

The paper will present the results of a national survey carried out on behalf of the Italian Observatory on the Family-Department for Family Policies, aimed at understanding how people balance family and working lives and at identifying some company good practices of work-family reconciliation. Italian companies involved in the work-family reconciliation have been mapped with a quantitative methodology; then were identified some promising practices and case studies have been made. For each case study were carried out focus groups with employees of different occupational profile, age and sex; the attention was focused on the family situation, trying to clarify the distribution of tasks within the family, the support provided by partner, parental and friendship network and the change potentially brought about in

their lives since the birth of children; we have also tried to understand whether the reconciliation measures provided by company were actually useful for them to reconcile the different commitments of life. The survey so allowed to highlight the complexity of work-family reconciliation and also the bond with the process of structuring of personal identity: reconciling the demands of family and work does not only involve holding together different time frames (family and work time) but entails passing judgment with respect to oneself and to one's own life – in the present (who one is) and in the future (who one wants to become). The outcome of family-work reconciliation, the concrete choices put into practice, thus derive, at least ideally, from the order attributed to personal ultimate concerns.

## Family and Work Decision: Monetary Reasoning and Relational Situations in Mothers' Arguments

Anne M. Mattila, University of Helsinki | [anne.mattila@helsinki.fi](mailto:anne.mattila@helsinki.fi)

In this paper I investigate the ways in which the mothers of young children cite money as a reason for their choice between home and work. I try to find out whether money is a pre-eminent reason for the choice of work situation in each case, and to pinpoint the reasons to choose staying at home over working in relevant cases. Through monetary reasoning I clarify how the subjective pursuits arise and are modified in relational situations. The actions of the other spouse inevitably set the conditions for the actions of the other. The economic situation of the subject and the family along with the social conditions involved together form the additional context of the choice with which the subjects are faced. The

possibility of earning one's own money is usually considered a crucial element in the pursuit of equality between sexes. But the family can also be seen as a unit where money is a common factor and where responsibilities can be shared in an appropriate way according to individual preferences. Arguments for individual choice and societal responsibility have been related in both choices. The growing equality between sexes is considered an aspect of modernity but it has also been argued that the future development of the new generation and the ways in which it will try to realize its concerns can be difficult to anticipate. My research is based on the interviews of 35 Finnish mothers of 2-year-old children, with

different kind of work-family choices. The mothers cohabited and their level of education was high. In the interviews I questioned them

concerning their life history and the reasons for their home or work-related choices.

## **a06JS05JS13 - Family, Consumption and Markets**

Chair(s): Bente Halkier (University of Roskilde, Denmark)

### **Conspicuous Gifts and Catholic Rite de Passage in Poland.**

Wojciech Poteć, Warsaw University of Life Science SGGW | [polecw@gmail.com](mailto:polecw@gmail.com)

In this paper, I focus on the ethnography of the gifts and consumption accompanying the catholic rites de passage such as child baptism, "First Holy Communion" and wedding. I examine the cultural patterns pushing the family of the child to give luxurious gifts with the special attention of the role (and obligations) of the godmother and godfather of the child. The institution of the godparents is still important in the Polish society although it loses its traditional, religious meaning and nowadays the role of the godparents is rather to take care of the consumption of the child (by supplying expensive gifts) and not of the religious education of the child. I try to show how the patterns of that kind of consumption

are rooted in the Polish society: how they adapt to the different economic situations and how they adapt to the external pressure, even the pressure of the catholic priests. On the other hand, I try to show how those customs exert pressure on the economic behavior of the persons involved in the family obligations and the pressure emerging of the role of the godmother or godfather. The empirical data of the paper are: 1) participatory observation, 2) interviews with parents, god parents and catholic priests and 3) analysis of the video recordings of parties given by parents on the day of their child's baptism, first holy communion and wedding.

### **Doing Gender through Cookingpractices. Social Change in a Comparative Perspective.**

Lotte Holm, University of Copenhagen | [loho@foi.ku.dk](mailto:loho@foi.ku.dk)

Marianne P Ekström, University of Gothenburg | [Marianne.p-e@telia.com](mailto:Marianne.p-e@telia.com)

Sara Hach, University of Copenhagen | [hach@foi.ku.dk](mailto:hach@foi.ku.dk)

In Europe, the gender division of labor has shifted within households. Time-use studies in many countries document that over the last decades the time men spend on household tasks increases while the time women use decreases. The question is whether household tasks are becoming less gendered or, whether new ways of doing gender have emerged? The

preparation of meals is a core activity in households, an important medium for producing and reproducing families and often described as central to female identity. Food preparation and cooking are typically seen as examples of routine tasks which are on-going, and nondiscretionary tasks typically done by women, as opposed to intermittent tasks which

are more flexible, done only occasionally and typically by men. However, cooking has increasingly become an arena for creative leisure activity, supported by an overwhelmingly growing mass of media hype about gastronomy and cooking, increasingly framing this as a masculine arena. Has this led to changes in the every-day gender division of labor related to cooking and preparation of meals? Based on data from two surveys conducted in four Nordic countries in 1997 (N=4823) and in 2012 (N=8248) we ask: How

has the gendering of cooking changed over the last 15 years? Is cooking as ordinary routine obligation increasingly taken care of by men or do men only cook for special occasions? Is male cooking motivated primarily by interest in cooking or by obligation and has this changed over time? Finally, we ask whether the socio-demographic profile of male cooks has changed over the last 15 years. The analysis is inspired by practice theory and gender performance theory.

## **Consumer Revolution Interrupted: Household Innovations and the Shift from Ages of Custom to Ages of Fashion in Poland**

**Joanna Zalewska**, The Maria Grzegorzewska Academy of Special Education | [joanna.marta.zalewska@gmail.com](mailto:joanna.marta.zalewska@gmail.com)

Consumer revolution is a term applied when studying the emergence of consumer society in western countries. The paper analyses some aspects of the course of consumer revolution in Poland, drawing upon the ethnographic data from the life course research conducted among the representatives of the generation born in 1918-1942 living in Warsaw. The paper argues that consumer revolution took place in People's Poland after the Second World War due to increasing mobility, urbanisation, industrialisation, money economy development, access to education and mass media, despite the lack of a free market in the socialist state. The agents of the consumer revolution in daily life of the studied generation were innovations in household appliances which facilitated the formation of meta-habits such as flexibility and openness to outside

influences. Due to meta-habits, fashion became the chief mechanism regulating consumption. The changes were accompanied by new social practices allowing the individual to supersede the family as the unit organising consumption; changing bonds within families - from instrumental relations to symbolic exchange; and disappearance of pre-war customs. Collectively this may be interpreted as a transition from the ages of custom to the ages of fashion. However, these changes were inhibited by the growing indolence of the socialist state. For this reason, family co-operation remained important for the organisation of consumption and the traditional division of duties within the family was preserved to some degree. Consumer revolution burst out again only after the transformation of 1989.

## Doing Parenthood through Children's (Consumer) Culture

David Cardell, Linköping University | [david.cardell@liu.se](mailto:david.cardell@liu.se)

Anna Sparrman, Linköping University | [anna.sparrman@liu.se](mailto:anna.sparrman@liu.se)

Anne-Li Lindgren, Linköping University | [anne-li.lindgren@liu.se](mailto:anne-li.lindgren@liu.se)

Tobias Samuelsson, Linköping university | [tobias.samuelsson@liu.se](mailto:tobias.samuelsson@liu.se)

Presence and involvement is regularly portrayed as a positive "fact" of western parenthood, suggesting that parents ought to be, as well as are, there for children. Ideologically this is reflected in research which takes the nuclear family for granted. In research of amusement- and theme park visits it is suggested that parents engage in activities with their children without friction or challenges. Consequently individuals are associated with each-other via assumptions about the firmness of social relationships. This paper, on the contrary, provides evidence of a multiplicity of parenthoods through ethnographic studies of strategies and activities in amusement-, theme parks, and children's museums, in Sweden and the U.S. We show that "doing" parenthood entangles decision-making about absence, involvement with and distance to children in relation to how

children's activities challenge adults, corporate management, and, materialities during visits to cultural institutions. By focusing on parenthood in settings that are for children and families we conclude that involvement is a negotiable and complex matter. "Doing" parenthood relate both to the absence and presence of children as well as the influence of culture and consumption. It suggests that parenthood – in general – ought to be conceptualized through a frame of multiplicity rather than as part of stabile relationships of a homogenous and imagined Family. Our empirical analysis lead us to suggest that there is no given "leash" between parents and children, as implied in previous research, but relations are worked out in time and space, which suggests that parenthood is about tricky social dynamics, negotiations and related to various materialities and settings.

### Triad Changing? The Position of the "Successful Child" in the Process of Negotiation with its Parents

Nicole Kirchhoff, Technical University, Dortmund | [nicole.kirchhoff@tu-dortmund.de](mailto:nicole.kirchhoff@tu-dortmund.de)

The family as a primary authority of socialisation is changing. This change is negotiated in public and private discourses and can be pinned down within a new and active understanding of fatherhood. In the framework of my diploma thesis I reconstructed concepts of families by considering representations of parenthood through photographs as well as

interviews with the photographed couples. The concepts of families are marked by the coexistence of modern and traditional elements. I based my research on interviews with heterosexual couples / parents from East and West-Germany. The methodology used was a mix between narrative-biographical interviews and group discussions. In my

lecture I will follow the question of how the politically intended - and socially approved - gender discourse affects the position of the child within the social space of the family. The evaluation of interview excerpts is realised by methods of narrative analysis and by the documentary method of Interpretation. My input suggests that the position of the child within the family triad, as well as the parental expectations that are marked by envisioning a "successful" or "soon to be successful child",

are becoming more pronounced. In my paper I will discuss the following: 1. how this process occurs along the backdrop of gender, and 2. how does parental history and experiences lead to orientations that are manifesting themselves in the child, and 3. how this assumed re-evaluation (higher value) of the position of the child suppresses unsolved problems and obvious needs for action within the couple.

## **The Portrayal of New Fathers and Mothers in Spanish and Italian Media during the Economic Crisis – Progress or Backlash? An Innovative Method to Measure Changing Injunctive Norms about "Good Parents" by Semantic Network Analysis**

Kristina AD John, Goethe-Universität, Frankfurt | [KristinaJohn@gmx.de](mailto:KristinaJohn@gmx.de)

The paper demonstrates how changing injunctive norms about "good" fathers and mothers can be measured by an innovative method of quantitative content analysis: Semantic Network Analysis. The data are quality mass print media in Italy and Spain from the 1990s to 2011. Spain and Italy have been classified as family/kinship solidarity models. However, since two decades, Spain moved from the male-breadwinner towards a dual-earner family model regarding family patterns and policies whereas Italy remained familialistic. Apparently, a change in gendered parenting attitudes occurred especially in Spain among young cohorts in contrast to Italy since the 1990s. Both countries have been affected severely by the economic crisis. Consequences were recent cuts in public expenditures and high unemployment rates. The question is, whether the economic crisis

had the same impact on gendered social norms about parenthood in Italy compared to Spain. Whereas Spain was severely affected by the economic crisis because of the preceding Spanish credit-financed house construction boom in the last decade, Italy didn't suffer as much from the dislocation of the housing bubble. Consequently, as young parents might have to pay back their housing mortgage in Spain, a "good mother" in Spain tries to contribute to the family's income by having a job. In Italy, the same argument of the economic crisis is used in contrast to strengthen the male-breadwinner-model as outsourcing of childcare and jobs are scarce. The results of the quantitative media analysis indicate that gendered parenting norms changed indeed more profoundly in Spain than in Italy since the 1990s and even during the economic crisis.

## **The Rise of Male Nannies**

Elisabetta Ruspini, University Milan-Bicocca | [elisabetta.ruspini@unimib.it](mailto:elisabetta.ruspini@unimib.it)

Aim of the paper is to focus on a crucial issue for gender equality research: the changing relationship between men and care. We will specifically focus on the case of male nannies

(also nannies, or male baby sitters), and on their online visibility. The number of male nannies is still small, but growing. However, there is still much debate about whether a

male baby sitter would be safe for a child or not. Many parents would have a hard time hiring a male babysitter for different reason. One first reason, linked to gender stereotypes, is that “women are more suitable than men to take care of children”. Another key reason is that some male baby sitters were accused of molesting young children while in care. However, the vast majority of men involved in childcare did not pose any threat of child molestation. Recent trends also show that

some families are searching specifically for male nannies. Those requests come from lone mothers, lesbian couples, families with boys, families with disabled children. Starting from these contrasting premises, the paper will explore the rising phenomenon of male nannies. The methodology we will use is a combination of the following: secondary analysis of existing data; documentary analysis, especially web documents analysis; information provided by key informants.

## What's Got Naming a Baby to Do with Crisis, and Change?

**Anja Bruhn**, University of Potsdam, and German Data Forum, Germany | [abruhn@ratswd.de](mailto:abruhn@ratswd.de)

**Denis Huschka**, German Institute for Economic Research (DIW Berlin), and German Data Forum, Germany | [dhuschka@ratswd.de](mailto:dhuschka@ratswd.de)

**Gert G. Wagner**, Max Planck Institute for Human Development, Berlin, German Institute for Economic Research (DIW Berlin), Berlin University of Technology (TUB), and German Data Forum, Germany | [gwagner@diw.de](mailto:gwagner@diw.de)

Our contribution delineates modern naming practices in Germany using empirical data from a representative longitudinal study, the German Socio-Economic Panel (SOEP). The SOEP offers an almost unique opportunity to link a child's first name to a broad range of subjective as well as objective information. First, the development of given names over about 100 years in context of societal changes is laid out. Results indicate, that in times of broad social upheavels parents change their naming behavior to less innovative choices whereas in prosperous times parents seem to be less bound to traditional naming. Although the parents' individual taste predominates the name choice, naming choices seem to be clearly affected by social change, and crises. Moreover, during all times, parents choose less traditional names when having a baby girl.

Apart from societal influences over time, we also analyze socio-economic determinants on modern naming practices in Germany. In an impressive study Bloothoft and Onland (2011) presented statistical evidence for the Netherlands showing that parents sharing name preferences also share certain socioeconomic determinants. So, does a given name might indicate the socioeconomic heritage? In our study, we present results regarding the relationship between preferences for name types and socioeconomic background in Germany. Preliminary results show that preferences slightly differ. We aim at a better understanding of the interaction between societal changes and individual decisions not only in Germany but in societies at large using an unusual indicator.

## Governing “Normal” Food and Sex Practices through Parenting Guidance Policies in the Netherlands

Marguerite van den Berg, University of Amsterdam | [m.a.vandenberg@uva.nl](mailto:m.a.vandenberg@uva.nl)

Government often uses definitions of “the normal” in policy interventions in the most private sphere of family life (Rose, 1989). This paper discusses the role that the category of “the normal” plays in parenting guidance policies in the Netherlands. I did ethnographic research in these practices that are organized (almost exclusively) for mothers by the local state in collaboration with schools. The paper considers what is defined as “normal” food and sex practices in the parent guidance programs and courses that I researched, and what that

means for distinctions between “normal” and “abnormal” families and mothers. The ethnographic material that I collected enables me to give an in depth account of the specifics of the “normal” and the “pathological” in contemporary government. For this account, I use Latour’s concept of translation: I show how translations of “the normal” take place between different locations in government. In other words: how do definitions of “the normal” made in one location end up in practices?

## b06RN13 - Fertility and Reproduction 4

Chair(s): Vida Kanopienė (Department of Sociology - Mykolas Romeris University)

### Pathways to Early Parenting in an Impoverished Rural Region

Ildiko Husz, Hungarian Academy of Sciences | [husz.ildiko@tk.mta.hu](mailto:husz.ildiko@tk.mta.hu)

The rise of the mean age of childbearing is observable in Hungary from the early 1980s. Adolescent birth rate follows downward trend, now is about 18 per 1.000. However, in Borsod county, an area of multiple economic and social deprivations, this rate remained considerably higher than the national average. A demographic survey of small villages in Borsod studied women without upper secondary school certificates, and was followed up by life-course interviews. The purpose was to study patterns and ethnic-specific aspects of how people living in poverty bear children and start families. The share of teenage mothers in the sample was especially high among the Romanies, but the incidence of adolescent births among non-Romas was also

above the average. This paper presents some results of what the qualitative research discovered concerning the factors leading to early childbearing. Three main types of life-courses have been identified. Many of the non-Roma interviewees could not complete the trade school because of the need to make a material contribution to the family. This section of local society has its origins in agricultural labourers and poor peasants. Their path to adulthood is short and begin with finding a job. Marriage and the birth of the first child are preceded by several years of work. In the life stories of Roma women school hardly merits a mention. Reaching adulthood means finding a partner and after a very short time bearing a child. Paths to adulthood mentioned above can

be considered as traditional poor life-courses resulting in functioning – although ethnically different – family patterns. Only the third group

making up the minority of respondents shows the signs of family dysfunctions.

## Fixed-Term Job, Long-Term Parenthood – Rationalities of (not yet) Having a Child in Conditions of Work Precarity

Johanna Närvi, National Institute for Health and Welfare | [johanna.narvi@thl.fi](mailto:johanna.narvi@thl.fi)

The paper explores realities, rationalities and experiences of family formation in the Finnish context of work precarity. It draws on biographical semi-structured interviews from 29 mothers or fathers who had worked in fixed-term contracts. I discuss the ways in which women and men reflect and decide about (the timing of) having children; and the rationalities behind these fertility choices. Postponement of the transition to parenthood has been related to the structural uncertainty of the labor markets, but also to cultural changes in gender relations, as well as to individualized orientations and preferences. In Finland, the birth rate is relatively high, at 1.8. This has been attributed to the supportive family policies, which allow women to combine motherhood with paid work. However, fixed-term contracts are common among young women, hindering both career stability and

transition to parenthood. Moreover, becoming a mother without a permanent working contract is related to longer care-related absences from the labor market. Along with the structural constraints, the competing cultural ideals of gender equality and shared parenthood, paid work as a moral duty and the child's best interest frame parents' action. I argue that these institutional frames are anticipated and negotiated in individual women's and men's choices concerning paid work, childbearing and care. The widespread ideal of extensive home care of small children is to be reconciled with the intensive but temporary commitments of precarious work. Precarity, however, is mediated through prior experiences, future opportunities and personal resources as well as preferences. Finally, the choice is negotiated with the other potential parent-to-be.

## Parenthood and Life Satisfaction: Why don't Children Make People Happy?

Matthias Pollmann-Schult, Social Science Research Center, Berlin | [pollmann-schult@wzb.eu](mailto:pollmann-schult@wzb.eu)

Previous studies on the association between parenthood and subjective well-being have ascertained that parents are not happier than childless people. This study addresses the question of why children do not enhance their parents' level of life satisfaction. A major objective of this study is to scrutinize the hypothesis that children by themselves have a positive effect on life satisfaction but that these benefits are offset by the various costs of children. My analyses go a step further than previous research by explicitly factoring in the financial and time costs of children. The

analysis was based data from the German Socio-Economic Panel (1993–2010, N = 13,093). I applied a fixed effects modeling approach. The primary finding of this study is that, when taking into account the costs of children, parenthood substantially and permanently boosts life satisfaction, confirming hypothesis happiness-enhancing effects of children are neutralized by interrelated costs of parenthood that interfere with well-being. Another major finding is that the costs of children affect the life satisfaction of women and men differently. Whereas the benefits from parenthood for men

were mainly offset by financial costs, the positive effects for mothers were overshadowed by financial as well as time costs. Surprisingly, although male-breadwinner couples experience less stress and strain than dual-earner couples, they do not report higher levels of life satisfaction in

comparison with full-time dual-earner couples. My results suggest that less time pressure for male-breadwinner parents does not translate into higher levels of life satisfaction because these couples experience higher financial costs from parenthood.

## **The Ideal Size of the Family in Today's Societies of Southern Europe: Determinants and Constraints**

**Andreia B. F. Maciel**, Évora University/CIDEHUS/FCT | [abfmaciel@fa.uevora.pt](mailto:abfmaciel@fa.uevora.pt)

**Maria F.F. Mendes**, University of Évora | [mmendes@uevora.pt](mailto:mmendes@uevora.pt)

**Paulo Infante**, Évora University/CIMA | [pinfante@uevora.pt](mailto:pinfante@uevora.pt)

It is argued that the low fertility level of the moment is fundamentally the result of the postponement of entry into reproductive life and not necessarily due to a reduction in the number of children desired by couples. Under this point of view, these demographic changes are just temporary, and it is expected that at the end of the postponement period fertility will increase, since couples can carry out their fertility intentions later on. Nevertheless, it is difficult to assume that the low fertility rates observed in the past decades - immersed in a specific social and cultural context - cannot influence subsequent changes in family size ideals. Using data from the 2006 Eurobarometer (the latest data available), we adjusted a multinomial logistic regression model with the variable "ideal number of children" categorized into 3 categories (0: 2

children; 1: less than 2 children; 2: more than 2 children). We can conclude that sex, age, religion, marital status, education and the country of residence influence the different preferences for ideal family size among the residents of European Southern Countries. The variables education and marital status interacted as well the religion with the age. The results indicated also that women, contrarily to men, have more possibilities of not be so attached to the "two children norm", married couples have a higher possibility to wish families with more than two children, people with a higher level of education are more likely to have a lower ideal family size than two children. At the country level, the Spanish and the Greeks showed greater possibilities of having an ideal superior to two children, relatively to the Portuguese.

## **Strong Families Relations and Low Fertility Rate: A Longitudinal Comparison between Sardinia and others Italian Regions.**

**Brunella Fiore**, Università degli Studi di Sassari | [brunella.fiore@unimib.it](mailto:brunella.fiore@unimib.it)

**Elisabetta Cioni**, Università degli Studi di Sassari | [cioni@uniss.it](mailto:cioni@uniss.it)

The hypothesis of the "too much families" by Livi Bacci had a great influence on the Italy's low fertility studies. Recently, the Italian researchers have turned from economic theories to family and family relationship

studies in order to understand the choices that could have an impact on the fertility of the couples (Del Boca 2002; Sgritta 2001). Sardinia provide an optimal case study for research on both the economical and social aspects; on one

side, in the last years Sardinia is afflicted by the critical economical situation characterized, among other things, by the very high rate unemployment. On the other side, Sardinia changes from the very high to the very low fertility rate in the last 50 years. In this paper we analyse the underlying dynamics of low fertility phenomenon in Sardinian and other regions according to the family characteristics of young couple and their parents. Data from the Household Multipurpose Survey "Family and Social Subjects" are considered. A longitudinal perspective on the three waves of this survey (1998, 2003 and 2009) has been developed in order to compare the data in

three different times. The results confirm that family relations are particularly strong within generations in Sardinia compared to other Italian regions. In particular female maternal kin appear to be determinant in the decisions and regulations of the young women and in their approach toward the fertility and reproduction's choices. Furthermore, Sardinia shows low rate of businessmen, confirming a general cultural low risk inclination of people (Lupton 2003; Trentini 2006). This last, combined with the particular familiar relationship, could be translated into a greater carefulness in having one children at least.

## **c06RN13 - Balancing Family, Working Lives and Job Mobility 4**

Chair(s): Vida Cesnuiyte (Department of Sociology Mykolas Romeris University)

### **Women in the Labour Market: High Fertility and Employment. The Impossible Recipe?**

Lídia P. Tomé, University of Évora | [lidiap\\_tome@hotmail.com](mailto:lidiap_tome@hotmail.com)

Maria F.F. Mendes, University of Évora | [mmendes@uevora.pt](mailto:mmendes@uevora.pt)

The central role of family in the organization of labour market and welfare is considered one of the key traits of a hypothetical southern European model. Such southern family model inhibits female labour force participation since most care services are performed within the family by women, instead of being externalised thereby both relieving women of excess work in the family and creating job opportunities. Such family model is presented as the "root cause" to the low female employment rates in Spain, Greece and Italy. Is then, expected a conflict between high female labour participation and high fertility levels. However Portugal had already in the 60's and 70's an extraordinary balance between female employment rate and high fertility. These

exceptionally high rates of female employment revealing an "apparent" inconsistency of such rates with the familistic features that are said to characterize the organization of welfare and employment in the south of Europe. The traditional low rate of female employment are not conventional for the Portuguese women, and even the erosion of familistic model in a first moment showed no negative impact of motherhood on women's employment, implying that mothers of young children are even more likely to be employed than non-mothers. This work aims to identify the changes in the traditional South European familistic model which is the consequence from the impact of employment, education and family in the decline of the number of children.

## Family Composition, Work-family Conflict and Coping in Post-divorce Families: The Persistence of Gender Roles

Sara A. A. Symoens, Ghent University | [sara.symoens@ugent.be](mailto:sara.symoens@ugent.be)

Piet F. Bracke, Ghent University | [piet.bracke@ugent.be](mailto:piet.bracke@ugent.be)

Tension resulting from combining 'work' and 'family' is found to be especially high in women given the persistence of traditional gender roles in families. This research tries to detect whether and to what extent this also holds for those who have experienced a divorce, a growing group in contemporary society. As new partnerships and newly composed families do not generally correspond to the ideal type of the family, we have reason to suppose gender roles change. We question to what extent both women and men are confronted with family-to-work- and work-to-family spillover after divorce; how this relates to the structure of the post-divorce family (taking into account partner status and the presence of children – including descent and custody); and to what extent coping mechanisms may interfere. We use the data from the survey 'Divorce in Flanders' (Mortelmans et. al., 2011), gathered

in 2009-2010, and select 3678 divorcees (1776 men and 1902 women) who are in paid labour and are younger than age 60. Gender specific linear regressions using PASW 18.0 are performed. Although both men and women report more problems of work interfering with family than vice versa, results reveal that gender roles do seem to persist: (1) overall, a new partner seems to lower family-to-work spillover in men and work-to-family spillover in women, and (2) it is especially for women that children are an important source of combination pressure. No differences by custody-type were found, but descent of the children does seem important. Finally, (3) half-time employment and external help may to a certain extent aid in coping with spillover, but also in this, important gender differences were found.

## The Challenge of Family & Work Reconciliation for Fathers: Case Studies in Italian Companies

Maria Letizia ML Bosoni, Catholic University of the Sacred Heart of Milan | [marialetizia.bosoni@unicatt.it](mailto:marialetizia.bosoni@unicatt.it)

In the post-modern era, the transformations in masculinity and transition to parenthood become a relevant issue: the traditional differentiation between male and female tasks and responsibility is no longer sustainable and needs to be reconsidered. Thus, the complex issue of balancing family and work represents a relevant challenge also for men. Several empirical studies highlight a transformation of the father role, both in Italy and in the wider international context, which implies a "more involved" and "new" father style. Nevertheless the strong relation with job remains a pivotal trait shaping men identity, especially in Italy.

This paper is aimed to presents findings from a research on working-fathers, conducted in Italy between April 2010 and February 2011, in order to understand how men manage the "double role" of father and worker and how the company supports the employee needs related to family&work balance. The hypothesis that guides this research is that the expression of father's role and the paternal strategy of conciliation are strongly influenced by the workplace (company culture, the representation of men as fathers and the major reconciliations measures). In particular 3 case studied has been carried out, using a

qualitative research techniques, aimed to understand both the corporate culture in terms of care for employees and the personal experience of fathers. In total, 45 interviews has been done: semi-structured interviews

with managers focused on the corporate culture and narrative interviews with employees (fathers with young children) focused on the transition to parenthood.

## **Paternity Leave and Career in Norway**

**Sigtona Halrynjo**, Institute for Social Research, Oslo | [sigtona.halrynjo@samfunnsforskning.no](mailto:sigtona.halrynjo@samfunnsforskning.no)

**Selma Therese Lyng**, Work Research Institute, Oslo | [selma.therese.lyng@afi.no](mailto:selma.therese.lyng@afi.no)

This paper examines the impact of parental leave in Norwegian elite professions. Utilizing a multi-method approach we explore understandings, use and consequences of paternity leave in career jobs. Combining quantitative and qualitative data, 2843 questionnaires & 38 in-depths interviews from parents in elite professions, we examine if and how the fathers quota has increased fathers use of parental leave and possible effects on father's career probability and equality among mothers and fathers in work and family life. We find that the father's quota has increased father's use of parental leave. Paternity leave has become normal, even in elite professions. Nevertheless, the gendered division of parental leave is not changed; mothers' leave is still many times as long as fathers'. Despite the limited extent of paternity leave, regression analysis show a negative effect on elite

educated fathers probability of becoming top leader, controlled for age, career preferences and partner's educational level. A central mechanism of parental leave in career jobs is the "slow-down effect". Being on leave implies a risk of being replaced, thus reducing motivation and further career possibilities. This risk contributes to sustain fathers leave as "optional". The fathers in our sample do not experience that they have to take the long leave if it implies the risk of losing career momentum. An interesting finding is how career costs are accentuated for fathers and minimized for mother, thus contributing to sustain a gender traditional practice. In contrast to mothers in career jobs, these fathers can still choose if they are willing to pay the prize of limiting own career investments.

## **Who is hit more by the crisis? Exploring gendered patterns of work-to-family conflict**

**Dirk Hofäcker**, University of Mannheim | [dirk.hofaecker@mzes.uni-mannheim.de](mailto:dirk.hofaecker@mzes.uni-mannheim.de)

Under the rising influence of globalization and employment uncertainty throughout recent decades, finding the right balance of work and family demands has turned into a difficult exercise. Existing research mostly has explored this relationship by looking at the effects of atypical work forms (such as fixed-term work or work involving irregular working hours), showing that the affectedness by such

type of employment tends to increase potential work-life conflict for both men and women. Yet, until now, little attention has been paid to the question how the experience of 'new' employment uncertainties throughout the recent financial crisis has affected the individual ability to reconcile both fields. Using data from the 5th wave of the European Social Survey, fielded in 2010, this paper intends to fill

this gap by empirically investigating the influence of crisis-induced uncertainties experienced at the workplace level, the household level and the individual level on perceived work-to-family conflict. In this respect, specific attention will be paid to the

questions (i) in how far these effects vary for men and women, and (ii) in how far nation-specific welfare and labour market policies within European countries are able to mediate such detrimental effects.

## **a07RN13 - Social Policy and Family Interventions 2**

Chair(s): Eric Widmer (Dept of Sociology - University of Geneva)

### **Biologising Parenting: Neuroscience Discourse and English Social and Public Health Policy.**

Jan Macvarish, University of Kent | [j.macvarish@kent.ac.uk](mailto:j.macvarish@kent.ac.uk)

This paper will discuss the construction of the child and the parent in recent English social and public health policy through the growing concern with the infant brain. The argument that the 'early years' are the most important in a person's life because of their unique role in cognitive and emotional development has been translated into policies designed around the assumption that 'early intervention' is justified and necessary. Since 2002, the UK has seen a rapid development of policy initiatives rationalised upon an evidence-base claiming authority from brain science. It is claimed that new neuro-discoveries have transformed the ability of experts to measure the differential

impact of varying 'parenting styles' on the developing child, providing a basis for state-led recommendations and interventions to encourage 'best practice' in parenting. The impact of 'brain claims' on the political argument for the implementation of 'early intervention' strategies will be discussed and questions will be raised about the implications of such an approach for parental autonomy and the privacy of family life. The paper arises from a study funded as part of the 'Uses and Abuses of Biology' Grants Programme and conducted by associates of the Centre for Parenting Culture Studies at the University of Kent.

### **Choice and Flexibility in the Father's Quota**

Berit Brandth, Norwegian University of Science and Technology | [beritb@svt.ntnu.no](mailto:beritb@svt.ntnu.no)

Elin Kvande, Norwegian University of Science and Technology | [elink@svt.ntnu.no](mailto:elink@svt.ntnu.no)

A father's quota, an individual, non-transferable parental leave rights for fathers, have been put on the policy agenda in several European countries. Figures from Nordic countries prove that such an interventionist policy has been successful in bringing more fathers home. In Norway this right, the father's quota, was recently extended to 14 weeks.

Some years earlier it was, however, made open to unlimited flexible use by means of postponement and part-time work until the child turns three years old. Thus, the father's quota contains both interventionist and liberalist/free choice elements. The objective of flexibilization was to make it more attractive for fathers and thus to promote gender

equality. However, the discourse of parental choice is known to sit uneasily alongside a discourse of gender equality. This is the point of departure for this paper that focuses on how fathers on leave make use of the flexibility within the father's quota. What are their motivations for flexible use, and what are their experiences? Analysis identifies two main motivations: to be able to better combine leave and work, and to reduce the child-care gap. A

third motivation is to accommodate longer family holidays; and a fourth to avoid responsibility for childcare for such a long period. Their experiences show that particularly part-time leave easily allows work to become predominant, making boundary setting vital in order to be able to prioritize child care. Analysis is based on interviews with 18 fathers who used the father's quota flexibly.

## Redistribution at the Local Level: The Case of Public Childcare in Italy

**Laura Cavalli**, Università di Verona | [laura.cavalli@univr.it](mailto:laura.cavalli@univr.it)

**Veronica Polin**, Università degli Studi di Verona | [veronica.polin@univr.it](mailto:veronica.polin@univr.it)

**Alessandro Buccioli**, Università degli Studi di Verona | [alessandro.buccioli@univr.it](mailto:alessandro.buccioli@univr.it)

**Paolo Pertile**, Università degli Studi di Verona | [paolo.pertile@univr.it](mailto:paolo.pertile@univr.it)

**Alessandro Sommacal**, Università degli Studi di Verona | [alessandro.sommacal@univr.it](mailto:alessandro.sommacal@univr.it)

**Igor Fedotenkov**, Università degli Studi di Verona | [igor.fedotenkov@gmail.com](mailto:igor.fedotenkov@gmail.com)→

Childcare services have gained increasing attention over the last years throughout Europe, particularly as an instrument to support work-family reconciliation. Referring to children lower than 3 years old within the Italian context, attention has been devoted to the analysis of access to childcare, but less attention has been devoted to aspects connected with the direct cost households have to sustain for formal childcare (fees) and to the economic convenience of sending kids to kindergarten. The goal of the present study is twofold: first of all, we aim to deepen the knowledge of public childcare (0-3 years old) tariff system in Italy -in particular in 103 municipalities- and their link with family income (progressivity). Secondly, we intend to understand the impact of such pricing policy on mothers' working decision and on working

mother's average income. Actually, recurring to a baby sitter is considered by the majority of women prohibitively expensive as it is going to private childcare; on the contrary, accessing public childcare is typically considered less expensive (National statistics using municipal account data estimates that families whose children go to public kindergarten pay the 18% of the total costs, Istat 2012) even if the current picture highlights that almost half of the children using formal childcare goes to private kindergarten (Istituto degli Innocenti, 2012). We demonstrate that such concern is not truthful everywhere in Italy: considering carefully this feature of public childcare could prevent women leaving the working place, supporting the presence of a second earning within a family - certainly a protection during the crisis.

## A Tale of Four Cities: The Influence of Culture and Institutions on Parental Choice for Childcaring in Bratislava, Prague, Oslo and Stockholm

Steven Saxonberg, Masaryk University | [sax@post.utfors.se](mailto:sax@post.utfors.se)

Christina Bergqvist, Uppsala University | [Christina.Bergqvist@statsvet.uu.se](mailto:Christina.Bergqvist@statsvet.uu.se)

This article investigates the role of culture and institutions when parents decide how to arrange care. It compares the interrelationship between policies, attitudes and practices in two different cultural and institutional contexts (the Czech and the Slovak Republics and Norway and Sweden). We have conducted 100 semi-structured interviews with parents in the capitals of the countries. The questions were designed to understand how they ideally would like to do and what they actually had to consider when they decided about parental leave, different forms of childcare and work. Our results show that little difference exists between Czechs and Slovaks or between Swedes and Norwegians, but great differences

between post-communist countries and the Nordic countries. For example, we find that Czechs and Slovaks seem to take the current situation as "natural," thus indicating that institutions can influence attitudes. In the Swedish and Norwegian cases, there might be a cultural shift taking place, in which parents support the idea of gender equality and access to high quality public childcare at the same time as they like to stay at home for longer periods than the paid parental leave period. However, they think fathers should share more equally in the leave time. These desires could lead to changes in policies. Thus, there is an ongoing interplay between culture and institutions.

## b07RN13 - The Challenges of Family Transitions in Times of Crisis

Chair(s): Detlev Lueck (Federal Institute for Population Research, Wiesbaden, Germany)

### Waiting for Better Days... Couples' Negotiating the Transition to the 2nd Child

Vanessa Cunha, University of Lisbon | [vanessa.cunha@ics.ul.pt](mailto:vanessa.cunha@ics.ul.pt)

David Cruz, University of Lisbon | [david.cruz@ics.ul.pt](mailto:david.cruz@ics.ul.pt)

In Portugal fertility has been undergoing a steady decline since the 1970s. A main trend linked to the Portuguese low fertility comprises the increase in one-child parities along with the cutback in higher birth orders. And this seems to be closely related with the postponement of the 2nd child, an upward trend at least since the cohorts born in the early 1950s. Postponing this childbirth several years became a common fertility behavior and an increasing pathway to unmet childbearing preferences and early intentions. Previous extensive research on the reproductive

trajectories of men and women in their late thirties, pointed out the direct and indirect costs of having children as the main drivers for postponing or refusing to give the step toward a 2nd child. In the current context of economic crisis, characterized by unemployment and job instability, wage loss, housing constraints and severe cutback in public support, men and women are waiting for better days and postponing childbearing. Moreover, research also brought out a noteworthy gender gap concerning fertility behaviors and intentions, since men record considerably lower fertility

levels but higher responsiveness to late childbearing than women. Hereupon, drawing from an ongoing comprehensive research on couples' childbearing intentions, based on in-depth interviews with both partners, this presentation intends to shed light on the complex decision-making process that

underlies the transition to the 2nd child: how couples negotiate this transition and cope with mismatched childbearing intentions, and the circumstances that trigger the postponement or even the withdrawal of an intended childbirth.

## Grandparenthood and Subjective Well-Being: Moderating Effects of Educational Level

Katharina Mahne, German Centre of Gerontology | [katharina.mahne@dza.de](mailto:katharina.mahne@dza.de)

Oliver Huxhold, German Centre of Gerontology | [oliver.huxhold@dza.de](mailto:oliver.huxhold@dza.de)

**Objectives:** Research on the influence of relationships with grandchildren on older adults' subjective well-being (SWB) has been sparse. The majority of studies on grandparenthood and SWB have dealt with specific settings such as custodial grandparenting. However, these arrangements clearly differ from the 'normal' grandparent experience. We examined in a large representative sample whether grandparent-grandchild relationships were associated with four aspects of grandparental SWB (life satisfaction, positive and negative affect, loneliness). As conceptual work on the topic emphasizes a moderating role of social inequality, we tested whether the association between relationship qualities with kin and grandparental SWB differs between educational groups. **Method:** We used data

from the German Ageing Survey (N = 968; age, M = 73 years) and applied multi-group structural equation models. **Results:** Relationships with grandchildren were associated with all four facets of SWB. The association of relationship quality and SWB was moderated by grandparents' educational level for negative aspects of SWB (i.e. loneliness and negative affect) only. **Discussion:** Relationships with grandchildren seem to generally boost positive aspects of SWB (i.e. life satisfaction and positive affect), whereas the buffer function of these relationships may be unequally distributed across educational groups. Less educated grandparents might be more exposed to and might be less able to cope with stressful aspects of grandparenthood than their better educated counterparts.

## Transition to Adulthood and Pathways Towards Life as a Couple: the Relational Model

Elisabetta Carrà, Catholic University of Milan | [elisabetta.carra@unicatt.it](mailto:elisabetta.carra@unicatt.it)

The paper analyzes the transition adulthood, a crucial step, for intergenerational transmission, usually closely connected with the transition to life as a couple. The features of today's adult life are combined in many different ways: young-adult living in their birth families, young-adult in a couple, cohabiting couples with or without children, un-cohabiting

couples, marriage couples and so on. The first part of the paper will document the presence of different models of transition to adulthood and partnership in European countries, highlighting the Italian situation, in the second part we will analyze the different models for interpreting the morphogenesis occurred in the last 50 years; then we will finally propose

the relational model, based on an intergenerational approach.

## c07RN13 - Family and Gender Roles 2

Chair(s): Isabella Crespi (Dept. Education, Cultural Heritage and Tourism - University of Macerata)

### Henpecked Husbands and Power Women – Reflection on the Idea of Masculinity in Crisis

Anna Sofie Bach, University of Copenhagen | [aba@soc.ku.dk](mailto:aba@soc.ku.dk)

In the current Danish debate about gender equality it is claimed from various positions that men and boys are losing terrain. Women and their feminine 'ways of doing' rule the daycare facilities and the educational system. In addition they have marched into the all kind of offices attaining steady incomes of their own. These changes have effectively destroyed the former idea of the male breadwinner, leaving men with no distinct role in the family. So-called feminine values have gained superiority in the everyday life, it is asserted, which leave little or no room for so-called masculine practices. How are we to comprehend this idea of masculinity in crisis theoretically? In public debate being a man is pictured as a rather solid and fixed identity. At the same time masculinity is something that others (women) can divest you of which points

in direction of fluent elements in the construction of identity. Does this mean that a general reconstruction of masculinity is needed, as all men experience identity crisis, or it is group specific? Or is the debate to be understood as a crisis in a certain kind of hegemonic masculinity? If so, how do these different conceptualizations of masculinity and crisis affect the empirical entry to study gendered practices of men? This paper investigates the idea of masculinity in crisis in order to develop a theoretical framework for studying masculine family practices and identity construction among Danish men who is supposedly living in the frontline of the discursive battle of gender equality as they are married to a so-called power women, who is an independent and ambitious women with a non-traditional career job.

### All Happy Families are Alike; Every Unhappy Family Is Unhappy in its own Way? A Sense of Fulfillment in the Israeli Family

Anat Guy, College of Management - COMAS | [g1anat@colman.ac.il](mailto:g1anat@colman.ac.il)

Although there are no significant differences between male and female, religious and non-religious Jews regarding self-fulfillment in the family sphere, there are great differences in attitudes and beliefs regarding gender roles in general, and distribution of responsibilities regarding child rearing. These differences reflect the social context in which individuals

adopt a point of view concerning the "right" way of managing and achieving self-fulfillment in the family. Furthermore, the sense of positive self-fulfillment is well explained for non-religious women by their social attitudes, while these attitudes fail to explain the positive feelings among men (both religious and secular) and religious women. The negative

sense of failing to achieve self-fulfillment in the family is well explained by social attitudes for women, both religious and secular, while social attitudes fail to explain this negative feeling for males. These findings suggest that

modern demands for "positive feeling" and "self-fulfillment", is achieved (or denied) differently for men and women, and is highly related to social context.

## **Family Structure Change and Awareness of Gender Roles Inequalities. The Case of Stepmothers and Single Mothers in France.**

**Manon N Réguer-Petit**, Institut d'Etudes Politiques de Paris (Sciences Po) | [manon.reguerpetit@sciences-po.org](mailto:manon.reguerpetit@sciences-po.org)

My proposal explores how the change of family structure leads women to a growing awareness of gender roles. Being a stepmother or a single-mother promotes a call into question of gender inequalities and stereotypes in the family. Some studies show difference of individuals' opinion by marital (Letrait, Rault, 2009) and family status (Bigot, Delpal, 2004, Chauffaut, Domingo, 2011). However, these studies are not questioning stepfamilies, whose numbers are increasingly significant (Vivas, 2009) and they omit to consider gender studies results about the specific impact of single-parenthood (Thompson, Walker, 1995, Seche, David, Quintin, 2002) and step-parenthood (Théry, Dhavernas, 1993, Cadolle, 2001) for women. Those are the reasons why I question the impact of family change on the awareness of gender inequalities by women. I use a mixed methods research procedure, gathering

qualitative and quantitative data. First, using the Generations and Gender Surveys (GGS, ERFI) and multiple correspondence analyses (MCA), I attempt to measure the difference of opinion and attitudes on gender roles and patriarchy between mothers in nuclear families, mothers in single-families and stepmothers. Secondly, I use ethnographical data built on the observation of three associations. It leads to understanding the awareness process and dimension of gender roles inequalities. I combined this ethnographical approach with 35 biographical interviews with mothers, stepmothers and single-mothers to understand correlation observed and to show if the experience of family change has an effect on women's gender stereotypes acceptance or if the women who experienced those changes were aware of gender inequalities before the family change.

## **Female Breadwinners = Change of Gender Roles?**

**Cornelia Koppetsch**, Technical University Darmstadt | [koppetsch@ifs.tu-darmstadt.de](mailto:koppetsch@ifs.tu-darmstadt.de)

**Sarah Speck**, Technical University Darmstadt | [speck@ifs.tu-darmstadt.de](mailto:speck@ifs.tu-darmstadt.de)

The structural transformation and crises of capitalism in the last 40 years have also affected family structures and the gender roles within these. The male breadwinner model, predominant and institutionally based in the Fordist era, has been increasingly replaced by the "adult working model", which relies on the wage of every adult in the family. However, the

growing normality of precarious work – also in traditionally "male professions" – has led to a rising number of couples and families reliant on the female breadwinner. In our paper, we want to present some of the findings of our ongoing qualitative research on the negotiation of gender roles within heterosexual couples of female breadwinning-households, comparing

different social milieus. Our DFG-funded investigation focuses on the couples' interpretations of gender roles and the division of labour on the one hand and, on the other hand, on their actual praxis – that is on the manifest and latent gender norms. We want to show that a change of gender roles is not only dependent on cultural concepts of masculinity

and femininity, but also on codes of love and partnership as well as on normative orientations with regard to the world of labour. Especially the emergence of alternative masculinities not primarily orientated towards profitable employment brings to light the relations between social structure and different life worlds regarding gender roles.

## **a08RN13 - New Family Forms in the European Context**

Chair(s): Eric Widmer (Dept of sociology. University of Geneva)

### **Gay Men Choosing Hetero-Gay Families: Continuity and Change in Family Life**

**Dorit Segal-Engelchin**, Spitzer Department of Social Work, Ben-Gurion University of the Negev | [dorsegal@bgu.ac.il](mailto:dorsegal@bgu.ac.il)

**Pauline I. Erera**, School of Social Work, University of Washington | [ererap@u.washington.edu](mailto:ererap@u.washington.edu)

Recent years have witnessed a dramatic shift in pathways to family formation among gay men in Western countries. While most gay fathers have become fathers in the context of a heterosexual marriage before coming out, increasing numbers of gay men are now pursuing fatherhood after coming out. Among the various pathways to gay fatherhood for gay men is to conceive and raise children together with a heterosexual woman outside of marriage, forming a hetero-gay family. This study examined the motivations of these men for choosing the hetero-gay family as the context for raising their children and the characteristics they sought in selecting the mother. In-depth interviews with nine Israeli gay fathers co-parenting with a heterosexual woman revealed three key motivations for

establishing a hetero-gay family: (1) belief in the salience of the essential mother; (2) belief in biological parenting; and (3) the belief that the child's best interests dictate having two parents of the opposite sex. The fathers also sought co-parents with maternal attributes such as caring, warmth, and nurturing. The fathers' motivations for choosing a hetero-gay family and the characteristics sought in a co-parent reflected a wish to replicate the traditional family. However, these men also planned on being actively involved fathers. From their perspective, co-parenting with a heterosexual woman enabled them to act as progressive "new" fathers who are much more involved than traditional fathers. But it also permitted them to rely on the mothers, thereby acting as traditional fathers.

### **Engineering Fatherhood in Israel: Fathers in New Family Forms**

**Efrat Knoll**, Bar Ilan University | [efratknoll@gmail.com](mailto:efratknoll@gmail.com)

This presentation is part of a research on cultural models of fatherhood in Israel, drawing from fatherhood experiences of men

in new family forms. The modern family structure has been diversified and changed throughout the 20th century, allowing a

situation where each part is disassembled and stands by itself, thus a variety of new family structures was formed. I chose to name men who chose to bring a child to the world and raise it within a new family form as "fatherhood engineers". My theoretical and methodological starting point is that parenthood and fatherhood are sociological constructions, and therefore all fathers actually engineer fatherhood. However, in hetero-normative families, the fatherhood engineering often remains transparent and is taken for granted. The marginal position of the informants in the current study with regards to the fatherhood field, can shed new light upon the hegemonic perspective of fatherhood. The position of the

new family in the wider field of the Israeli pronatalistic yet threatened by new family forms society, is particularly interesting. I ask to examine fatherhood in Israel through the new family forms. For that, I've interviewed 31 fathers, as they are manifested in Israel today: singular fatherhood; fathers in a same-gender family; joined parenthood; and divorced fathers who perform as the main caretakers. In this presentation I'll present some of the findings about cultural models of fatherhood in Israel. The discussion will deal with the translation fathers ask to do to the existing cultural models, and check their boundaries – change next to preservation.

## **Cohabitation as a New Family Form in Italy: How the Meaning of Marriage Changes**

**Monica Santoro**, Università degli Studi di Milano | [monica.santoro@unimi.it](mailto:monica.santoro@unimi.it)

In Italy cohabitations have spread slowly and they have never reached the level of the Central-Northern European countries. The low propensity of Italian young people to adopt this family form is partly linked to the postponement of stages of the transition to adulthood, especially leaving the parental home. Italy is one of the European countries with the highest percentage of young people living in the family of origin. The paper is based on the result of a qualitative research carried out in Italy in 2011 among 50 people who cohabited or married after cohabitation, with or without children. The analysis of the interviews shows that the meaning of cohabitation changes according to the experiences of leaving the parental home and the life course stages crossed by interviewees. For the

youngest interviewees cohabitation is a choice similar to marriage: they left the parental home to cohabit and received financial help from their parents. Marriage is postponed only for financial reasons whereas for interviewees who cohabited after leaving the parental home cohabitation had been an experimental choice. Marriage is valued for its legal and functional aspects, as a protection of the less financially independent partner. So it becomes a necessity only if the financial condition between partners is unbalanced in order to redress this asymmetry. If the partner conditions are equal – which is the case of the interviewees – marriage does not add benefits. Therefore all social and religious aspects of marriage are excluded by interviewees who were married or plan to marry only for instrumental reasons.

## New Family Forms in Switzerland: Reasons which Affect the Decision to Get Married: Results from a Qualitative Approach

Valérie-Anne Ryser, FORS c/o University of Lausanne | [valerie-anne.ryser@fors.unil.ch](mailto:valerie-anne.ryser@fors.unil.ch)

Jean-Marie Le Goff, University of Lausanne | [jean-marie.legoff@unil.ch](mailto:jean-marie.legoff@unil.ch)

Despite a slight increase of cohabitations and out-of-wedlock births in Switzerland since the beginning of the seventies, the incidence of childbearing within cohabitation remains low in this country compared to most European countries. Former researches have already demonstrated that cohabitation in Switzerland does not reflect a pattern of poverty and that married and cohabitant mothers differ; cohabitant mothers exhibiting more equal division of tasks within the household. However, few is known about the representations people living in Switzerland have about marriage and cohabitation and reasons why the majority of Swiss individual get married once they expect a child. Using focus groups interviews, this paper give insight to general social norms about non-marital

childbearing and cohabitation in Switzerland. We investigated the representations underlying reasons why women living in Switzerland still prefer to get married while they expect a child. First results based on these qualitative interviews demonstrate that social protection bring by the institution of marriage is becoming the key to understand this feeling of necessity to get married and the low rate of childbearing within cohabitation in Switzerland. In this sense getting married in Switzerland seems to reflect Swiss policies which do not value cohabitation as a new living arrangement. Second, narratives about marriage and childbearing within cohabitation can be understood under the prism of the concept of ambivalence.

## Living Apart Together in Europe. Comparative Findings of a Modern Family Form

Nicole Schmiade, Deutsches Zentrum für Altersfragen | [nicole.schmiade@dza.de](mailto:nicole.schmiade@dza.de)

Daniela Klaus, German Centre of Gerontology | [daniela.klaus@dza.de](mailto:daniela.klaus@dza.de)

Various sociological theories assume that family forms diversify as modernisation increases in a society. Coming from very different starting points, the theories of individualisation and structural functionalism agree to a large extent about the future of the family: as the family loses most of its functions and its members strive for self-fulfillment, a society of single households evolves, in which couples “live apart together” (LAT). Since LAT are commonly not included in official statistics, it is very difficult to estimate their prevalence. Wave 1 of the Generations and Gender Survey (GGS) allows us to analyse the frequency and structure of LAT in 13 countries (six Eastern European and six Western European countries). The dataset provides rich

information on the respondents’ type of partnership and is the only source of quantitative data that surveys LAT from a cross-national perspective. We find a clear connection between a country’s level of modernisation and the frequency of LAT (as a share of all non-single respondents). Analyses show that Eastern European LATs do not live this form of partnership as a result of their individual choice but are rather driven by circumstances. Whereas LAT-respondents in the West emphasise their willingness to keep independence from their partners, LATs from Eastern Europe rather intend to form a cohabitation unit with their partners in the near future. Initial descriptive findings will be backed by multivariate analyses that aim to

disentangle potential socio-structural and cultural predictors.

## b08RN13 - Family and Gender Roles 3

Chair(s): Maria Letizia Bosoni (Family Studies and Research University Centre - Università Cattolica di Milano)

### Transition to Parenthood in Italy: The Persistence of the "Family Care Model"

Torrioni Paola Maria, University of Torino | [paola.torrioni@unito.it](mailto:paola.torrioni@unito.it)

Sonia Bertolini, University of Torino | [sonia.bertolini@unito.it](mailto:sonia.bertolini@unito.it)

Rosy Musumeci, University of Torino | [rosy.musumeci@unito.it](mailto:rosy.musumeci@unito.it)

Manuela Naldini, University of Torino | [manuela.naldini@unito.it](mailto:manuela.naldini@unito.it)

This paper shows how dual-earner couples in Italy decide to balance work and family life across the transition to parenthood, and how they frame this decision with respect to their beliefs about mothers' and fathers' roles in doing "what is the best for the child". The paper is divided into 2 parts. In the first quantitative part, we reconstruct a baseline Italian scenario on prevalent women's and men's work and care behaviors around parenthood, with particular attention on the gender division of care, on attitudes towards family roles and judgments of fairness and satisfaction with the division of unpaid work. This analysis is based on two different data sets: "Indagine campionaria sulle nascite", an ISTAT survey of a sample of mothers, carried on in 2002 and 2005 and "Modelli di equità 2008-2009", a recent regional survey of a sample of 400 dual-earner couples living in

Torino and in its surrounding area. In second part of paper, the focus is on first-time parents and their plans regarding gendered divisions of childcare tasks, leave taking, employment interruptions, working time adjustments. In this part we present a qualitative study based on 44 interviews conducted on 22 Italian working couples during their first transition to parenthood, aged between 26-45 and living in Northern Italy in the city of Turin and in its surrounding area. From our interviews emerges that ideals about what's the "best for the child" contribute to construct very different roles for fathers and for mothers and contribute to influence in very different way men's and women's job investment even among the most "egalitarian" couples. The main "care ideal" behind Italian working couples expecting a baby is that a newborn baby needs.

### Gender Roles within Family: Does Parenthood Change Domestic Division of Labor?

Valeria Pandolfini, University of Genoa | [Valeria.Pandolfini@unige.it](mailto:Valeria.Pandolfini@unige.it)

What does it mean speaking about gender roles changing within family in front of the economic, social and cultural events characterizing the contemporary society? How

and at what extent the promotion of gender equality characterizing the recent European social policy is experienced by partners in everyday family life? How men and women

manage domestic division of labor and what is the impact on personal and couple identity? Does parenthood represent a changing element in the redefinition of gender roles in family? The paper aims to answer to such questions presenting the results of a qualitative research, conducted within an European Project, involving a sample of young adult Italian couples, married or cohabitant, with or without children, where one of the partner or both has/have a short time contract job. In order to analyze various individual, situational, biographical and contextual factors, several dimensions are considered, including working times, flexibility, employment situation, job security and

perceived economic well being, taking into account differences among people in education, age and working hours. The paper provides empirical findings exploring different strategies adopted by men and women to manage household and childcare responsibilities, underlining the influence of individual gender role attitudes as well of structural factors, such as the employment status, the income levels and the availability of support from family networks. Finally, it shows the emersion of a more symmetric family management in "dual earner" couples with child/children, with an increase of men's involvement in housework and childcare.

## **Couples in Transition in Spain. Dynamics and Tensions in Gender Relations for New Motherhood, from Doing Gender to Undoing Gender Practices**

**Carmen Botía-Morillas**, University Pablo de Olavide, Seville | [carmenbotia@upo.es](mailto:carmenbotia@upo.es)

The objective of the research presented in this submission is to explain the possible conditions and social dynamics which can encourage or hinder greater gender equality in non-traditional heterosexual couples. These are present among couples with the socioeconomic and demographic characteristics of those couples analyzed in the homogeneous sample: university educated, double incomes, middle class, agree on co-responsibility and older than thirty years of age. It has been performed a longitudinal qualitative study through open interviews with the partners separately during two periods, once during the pregnancy and once when the baby was between eight and twelve months old. In practice, the couples in the sample are in a transition from the traditional model -doing gender interactions- (although they maintain practices tied to it) to a new model

with balanced roles -undoing gender interactions- (although they are closer to this model in theory than in concrete practices). Without the necessary structural conditions, the mere desire to form an egalitarian couple is not enough. The involvement and availability of new mothers in raising their children cannot be understood apart from the role of fathers. In practice new motherhood is fraught with tension because of the contradiction between their former roles as independent and autonomous women and the roles of the traditional good mother carried out especially during the first year of life of their first child. During this time mothers appropriate strategically of discourses regarding legitimate ways of mothering. Thus, characteristic in recent mothers is the tension between the new mother - more egalitarian-, and the traditional good mother.

## The Arrival of the First Child and the Changes of the Gender Division of Housework. A Comparison across 5 European Countries

Cristina Solera, University of Torino | [cristina.solera@unito.it](mailto:cristina.solera@unito.it)

Letizia Mencarini, University of Torino | [letizia.mencarini@unito.it](mailto:letizia.mencarini@unito.it)

The birth of a child is a crucial event that changes the organisation of everyday life of individuals and couples. As well known, such reorganisation is gendered. It is mainly women who are considered responsible and allocate time to daily household chores and care work. Such allocation, however, is not independent – on one hand – from women's and men's educational and occupational profile – on the other hand – from the institutional and cultural context in which people live and make their choices. There is large evidence on the gender role-set in housework and care work in couples with or without children. Yet, much of it is based on cross-sectional data or – if longitudinal – on single country studies. In this piece of work we draw from the first two waves

of Gender and Generation Survey data, available for Bulgaria, France, Germany, Italy and the Netherlands. We explore how the division of domestic work changes in the transition to first parenthood and which are the determinants of such changes. Comparing across countries and using indicators of human capital, relative resources, time availability and gender ideology, we investigate how such gender division varies by education and socio-economic status, whether it responds to “human capital”, “bargaining theory” or “doing gender” theoretical predictions and whether such micro variations and mechanisms are the same in the different macro contexts.

## c08RN13 - Family Survival Strategies 1

Chair[s]: Sara Mazzucchelli (Family Studies and Research University Centre - Università Cattolica di Milano)

## Exploring Structured Ambivalence and Quality of Life of Grandparents: A European Comparison

Franz S. Neuberger, University of Zurich | [neuberger@soziologie.uzh.ch](mailto:neuberger@soziologie.uzh.ch)

Klaus Haberkern, University of Zurich | [haberkern@soziologie.uzh.ch](mailto:haberkern@soziologie.uzh.ch)

Cultural norms, family practice and the welfare state are intermingled. Due to crisis-related pressures, governments aim to increase labor force participations of older populations and women. Simultaneously, care responsibilities are shifted back to families while states lack the resources to provide enough services, e.g. public child-care. Grandparents step into the breach for working mothers and fathers who cannot access or afford public child-care. To

understand the complex relationship between cultural norms, family practice and quality of life, we analyzed structured ambivalence in grandchild-care in 14 European countries. We used the Survey of Health, Ageing and Retirement in Europe. Respondents were grandparents aged 50 and over with at least one grandchild 12 years old or younger. Friction between the economic need for new models of family life and a countries' family

culture can lead to ambivalent situations between needs and norms. We defined structured ambivalence as contradiction between behavior (providing grandchild-care) and cultural norms (grandparental obligations). We show that the relation between family practice and the quality of life of caregivers is molded by a country's family culture. In countries with high grandparental obligations, grandparents not engaged in

grandchild-care reported a lower quality of life. Compliance to norms (e. g. providing grandchild-care in countries with high grandparental obligations) was found to increase quality of life of grandparents. Governments should consider family practice and cultural norms in policy reforms in order to reduce structured ambivalences and increase quality of life of grandparents.

## **A Life of Caring. A Sociological Analysis of Family Caregiving.**

**Joana MPM Alves**, University of Coimbra | [joanaalves@ces.uc.pt](mailto:joanaalves@ces.uc.pt)

The importance of informal care provision is well-known. However, caregivers' life is almost unknown. This paper intends to give emphasis to the caregivers' role, giving recognition to a population almost forgotten – the informal carers of people with long term special needs. Informal care provision is a complex phenomenon, conditioned by the social and economical context, the characteristics of care receivers and the nature of the relationship between carer and care receiver. All these aspects determine the types, modes and times of care, and lead to different impacts on the carers' life. This paper aims at studying those impacts in the case of a permanent and long term care. Specifically, intends to understand

the motivations which lead some people to become carers; to understand how carers organize their time in order to respond to the care receiver needs; to know the formal and informal supports available. The study focuses on microanalysis and develops a qualitative approach, using in-depth interviews with caregivers. This work reveals that the caregiver role has deep impacts on carers' life in all the considered domains (work, job, leisure, health, personal life...). The results show the difficulty in combining the caring role with the other social roles, as well as the tendency to isolation within families that these situations lead to.

## **Family Survival Strategies and Network Solidarity in the Context of Children Needing Liver Transplants**

**Karen Lowton**, King's College, London | [karen.lowton@kcl.ac.uk](mailto:karen.lowton@kcl.ac.uk)

**Chris MH Hiley**, King's College, London | [chris.hiley@kcl.ac.uk](mailto:chris.hiley@kcl.ac.uk)

**Paul F D Higgs**, University College, London | [p.higgs@ucl.ac.uk](mailto:p.higgs@ucl.ac.uk)

Liver transplant is now conceptualised as a major yet unremarkable intervention. When first performed on children in the mid 1980s, lay understanding was that it would resolve the crisis of acute ill-health and save lives. However, from a family perspective, the transplant may be seen as an ongoing crisis through: attempts to manage a child's ill-

health and avoid transplant; parental decision-making to give consent for high-risk surgery; and on-going medical and family management which focus on averting transplant failure and early death. Based on interviews with 27 now-adult survivors of the first cohort of childhood liver transplant recipients in Europe, this paper reveals the role of tight and evolving supportive

family networks in managing individuals' health over three decades. This network provides the key context for recipients' growing up and growing older after a major, novel intervention. Life and health after transplant are uncertain, contingent, challenging, and complex. Parents' roles in co-constructing and retaining their child's history and personal narrative are pivotal and ongoing. These parents remain more intimately involved for a longer period in their child's lives than parents

of 'healthy' children. A recipient's wellbeing is contained within the family network which, through negotiation with the recipient, partners who join the family and siblings whose role develops as family members grow older, adapts over their lifecourse as new, successful strategies are learnt, and challenges overcome. Through this, the transplant can be seen as an ongoing process requiring family management rather than an acute event occurring for an individual.

## **a09RN13 - Social Policies and Family Intervention 3**

Chair(s): Giovanna Rossi (Family Studies and Research University Centre - Università Cattolica di Milano)

### **Parenting Support**

Ella Sihvonen, University of Helsinki | [ella.sihvonen@helsinki.fi](mailto:ella.sihvonen@helsinki.fi)

When reading newspapers or watching magazine programs it almost seems that parenting is in serious crisis. Children and youths are not feeling well, which is claimed to be result of dramatically declined parenting skills. In the Finland this phenomenon is named as "disappeared parenting". The main question is in my research, what is exactly claimed to be disappeared when arguing about parenting skills? I will draw on data from a qualitative study of family projects (N=300) arranged in the Finland between years 2000-2010. The family projects are pointed to invent new means to support family, and especially parenthood. In this paper I will explore how the family projects are aimed to – not only change

but – renew parenting. I will examine the nature of expertise developed in these family projects, which is explored from two different viewpoints. First, I will explore, what kind of skills experts of parenthood are required, and what kind of expertise is lying inside the family projects? Secondly, the emancipation of parents is actually a certain way to confirm parents own parenting expertise. In short, parenting embodies interesting contradiction: it is emphasized as extremely natural and important for children, yet at the same time it is seen as very fragile, and difficult, and in order to function properly, parents need to master special expertise knowledge.

### **Participatory Planning, Monitoring and Evaluation of Family Friendly Practices**

Bramanti Donatella, Università Cattolica del Sacro Cuore - Milano | [donatella.bramanti@unicatt.it](mailto:donatella.bramanti@unicatt.it)

The research, conducted in close collaboration with the Provincial Forum of Families, initiated a process of monitoring the work already done

for the families in the area of Lodi. The research involved also municipalities and third sector associations which, for various reasons,

carry on instances and implement interventions in a family friendly perspective. The aim was to highlight good practices already in place and offer criteria for devising future services, through the participation of all the stakeholders. In particular, has been monitored the emerging needs in families with children through a questionnaire distributed in the schools. The results show what are the needs, the demands and priorities of intervention for families in times of crisis. In particular, the needs and demands for action concern on reconciling work and family life, the strengthening of educational services for

children and the development of services for elderly care. Families show a remarkable propensity for solidarity with other families, with a deal for about 80% of respondents (data highlighted also in the interviews). The research project also activated a website ( [www.progettofamilyfriendly.it](http://www.progettofamilyfriendly.it) ) inspired by the techniques of participatory democracy, where families can directly indicate existing projects, give their opinions on the priorities of action, evaluate and comment the projects/services offered, submit ideas for new initiatives.

## **Best Relational Practices in Counseling Services for Family in Lombardy: Results from Case Studies**

**Matteo Moscatelli**, Università Cattolica del Sacro Cuore Milano | [matteo.moscatelli@unicatt.it](mailto:matteo.moscatelli@unicatt.it)

The work of family counseling services becomes difficult confronted with the increased complexity of the needs brought by the families and with the constant changes in the organization and structure of services dedicated to them. Given these dynamics, which can be considered today, the specifics of these services and what made them good practice? The research study attempts to answer these questions by analyzing eleven experiences in different clinics of the Lombardy region and highlighting the set of actions, projects, how to take charge, that can be good examples to be replicated. In particular, the work of analysis has the aim to differentiate the good practice identified according to their degree of customization and familiarization, ie the capacity / awareness of the service to promote

reflexively the relational and family interventions. Strengths in undertaking this process of improvement of these family services are represented for example by the personalization of the relationship with the families, the integration between health and psychosocial approach, the ability to bring together and integrate different skills and areas of intervention through maintaining a balance with the territory through the exploitation of all places of aggregation and promotion of health to a level of primary prevention (parishes, youth centers). Some counseling services have simply to highlight a trend that, at least in part, is already implied, as told from the case studies, while for the others the research would provide guidelines in order to pursue concretely this direction.

## b09RN13 - Family and Gender Roles 4

Chair(s): Karin Wall (Institute of Social Sciences - University of Lisbon)

### 'Religious' Equal 'Traditional'? A Quantitative Study of Gender Roles of Native and Migrant Population in Germany.

Inna Becher, Federal Office for Migration and Refugees, Nuremberg | [inna.becher@uni-konstanz.de](mailto:inna.becher@uni-konstanz.de)

Yasemin El-Menouar, Federal Office for Migration and Refugees, Nuremberg | [elmenouar@phil-fak.uni-duesseldorf.de](mailto:elmenouar@phil-fak.uni-duesseldorf.de)

According to the public perception, conservative gender roles are mostly determined by religious affiliation and religiosity. However, the findings of empirical studies are inconsistent: while there is some evidence for a moderate effect of religiosity on traditional gender roles by Muslims (Diehl/König 2011) there is also a positive association between Muslim religious affiliation and egalitarian gender roles (Scheible/Fleischmann 2011). Additionally, empirical studies so far mostly aim at assessing attitudes towards gender roles. Gender roles as actual division of household and care work or economic activity did not find much attention in this context. Using the data of our large-scale study of two populations in Germany, i.e. Muslims and Christians with and without migration background, we explore the

nature of the relationship between religious affiliation and religiosity towards gender roles for both groups separately and compare the results. In contrast to other studies, we use multiple measures of different aspects of gender roles and assess heterogeneity of Muslim populations by surveying people from numerous countries of origin. In this regard, we investigate whether there are more pronounced differences between Muslims and Christians or rather between people with different migration background. We also illustrate how much variation in attitudes and behavior concerning gender roles can be explained by religiosity and religious affiliation. In our analysis, we control for other variables, such as age, gender, educational background or migration status.

### Gender and the Division of Labor in Grandparent Couples

Thomas Leopold, European University Institute | [thomas.leopold@eui.eu](mailto:thomas.leopold@eui.eu)

Jan Skopek, University of Bamberg | [jan.skopek@uni-bamberg.de](mailto:jan.skopek@uni-bamberg.de)

Grandmothers provide far more childcare assistance than grandfathers do. This gender gap in grandparenting is well-documented – but not well-understood. The present study investigated whether, and to what extent, this gap was explained by a grandparent couple's division of labor into market and domestic work. We analyzed panel data from two waves of the Survey of Health, Ageing and Retirement

in Europe, comprising respondents from 11 countries. Linear regression models yielded three main findings. First, the trade-off between childcare and market work within grandparent couples was relatively weak, operating roughly on a one-for-eight basis. Second, transitions to retirement substantially reduced the gender gap in grandparenting: if a single-earning grandfather retired, his share

of a couple's total grandparenting hours increased by more than 30 percent. Third, controlling for couples' division of market work, the gender gap in grandparenting was smallest in the egalitarian north and largest in the traditional south of Europe, corresponding to a geographical gradient in the societal

framing of gender roles. The results direct attention to the employment-family nexus in later life and highlight the importance of understanding grandparenting as a life course phenomenon, performed by the grandparent couple as a unit of interacting providers.

## **Are European Families Changing their Gender Role Models? A Synchronic and Diachronic Analysis.**

**Vera Lomazzi**, Università Cattolica del Sacro Cuore | [vera.lomazzi@unicatt.it](mailto:vera.lomazzi@unicatt.it)

In the last twenty years women participation to the labor market contributed to change daily organization of family lives and the gender contract became more negotiable too. Male breadwinner model looks increasingly unsuitable, even more if we considerate the economic trends that Europe has to face with the global recession. Beside the needs that impose family on a dual earner model, with the consequent stress about the work-life balance challenges, we also attend to a new cultural perspective that points to a more equal distribution of responsibility both in public and in private life of man and woman, who more and more share the responsibility on the family well-being, taking in consideration both economic issues and the educational and care ones. Europeans face with a new model of parenthood that gives more value to fatherhood; the public role of woman, and so

also of working mother, is more recognized. Nonetheless, the traditional gender role model is still well-established in Europe, also if not in a homogeneous way, and it is suppose we are in a deep cultural change who definitely is not completed. The paper proposes a descriptive analysis of changes occurred in the last twenty years in women and men opinions about gender roles in family, using data from the European Values Study (EVS). With particular reference to the last survey of EVS, an "index of share responsibility" elaborated from the leaning expressed about mother and father roles, is adopted to describe a comparative analysis through European countries about the manage of time, referring to Eurostat study on the use of time in Europe, in order to enlighten possible connections between cultural opinions and behaviors actually practiced.

## **c09RN13 - Family Survival Strategies 2**

Chair(s): Sara Mazzucchelli (Family Studies and Research University Centre - Università Cattolica di Milano)

### **Critical Life Events - Factors for Conjugal Crisis?**

**Manuela Schicka**, University of Geneva | [manuela.schicka@unige.ch](mailto:manuela.schicka@unige.ch)

In times of crisis couples need personal resources to overcome the possible negative

impacts of critical life events on their relationship. Couples are exposed to the

occurrence of a variety of critical life events, such as unemployment, accidents and illness during their common life course. These events are expected to have an impact on the couple's relationship. The ability of partners to deal with such events can influence their relationship outcomes, such as satisfaction, consideration of separation etc.. It is hypothesised that couples react differently to the occurrence of critical life events depending on their resources and functioning. The data comes from the longitudinal Swiss survey "Social Stratification, Cohesion and Conflicts in Contemporary Families". This database contains three waves which were conducted in 1998, 2004 and 2011. Telephone interviews have been conducted with couples from the

three different language areas of Switzerland. The advantages of this database derives from the long observation period of around 15 years as well as from the fact that both partners information concerning different aspects of their relationship was available. The results show that partners who have higher fusion and who have a lower gender-segregated role differentiation are more successful in overcoming the crisis which a life event may cause. On the contrary, partners who organise their daily life autonomously from each other and who have a high gender-segregated role differentiation are expected to be more affected by the occurrence of critical life events.

## **Overcoming Life Course Adversity in Family: What Configurations of Couple's Personal Networks Matter?**

**Jana Veselá**, Université de Genève | [jana.vesela@unige.ch](mailto:jana.vesela@unige.ch)

This contribution addresses the interrelations between personal networks of couples and the adversity in the life course linked to critical life events such as unemployment, financial or health problems. By using a quantitative study we explore the extent to which critical life course events impact on couples relationships and well-being according to their personal networks. Thus, we test the buffering effect of partners' personal networks on couples. We hypothesize that some configurations of

partners' personal networks allow couples to face life course adversity better than others. The analyses are based on a sample of 721 couples who participated in two waves of a longitudinal and representative survey of Swiss couples. The results indicate that couples with large personal networks, and especially those that focus on relationships with friends, are less vulnerable than couples with intrusive kin or those with sparse and inactive partners' configurations.

## **Unemployment as Experience of Crisis. The Impact of Local Social Networks on Migration in Two Different Regions**

**Stefanie A. Kley**, University of Hamburg | [stefanie.kley@uni-hamburg.de](mailto:stefanie.kley@uni-hamburg.de)

The proposed contribution asks under which circumstances families are prone to migrate in the face of individually experienced unemployment and unemployment risk. Following a contrast group design, respondents from two cities in Germany with different levels of economic prosperity are

compared using event history data from a tailor-made panel study. According to a micro-economic approach to migration it is expected that people living in an economically deprived city are more likely to decide in favour of migration and actually move compared to those living in a prosperous city. On the other

hand, the new household economics approach and the theory of social networks stress the importance of the meso level. Individuals seldom decide in favour or against migration solely; rather the family makes joint decisions. Former research showed that for unemployed persons social networks are a major source for social support and are therefore especially important. The analyses reveal that the perceived risk of becoming unemployed indeed triggers migration decision-making, but exclusively in the deprived city. On the other

hand, having a partner, children and family at the place of residence might outweigh the impact of a perceived unemployment risk on migration decision-making. When it comes to putting migration plans into action, it is found that the unemployed living in the deprived city are significantly more often constrained from moving compared to the unemployed living in the prosperous city. The analyses suggest that a concentration of social networks at the place of residence accounts primarily for this effect.

## **a10RN13 - Families, Migration, Care and the Effects on Family Relationships 3**

Chair(s): Vida Cesnuiyte (Department of Sociology - Mykolas Romeris University)

### **Assumed and Invisible Roles of Families and Kinship in Long Term Care Provision among Turkish Migrants in the UK**

Shereen Hussein, King's College, London | [shereen.hussein@kcl.ac.uk](mailto:shereen.hussein@kcl.ac.uk)

Sema Oğlak, Dokuz Eylul University | [sema.oglak@deu.edu.tr](mailto:sema.oglak@deu.edu.tr)

There is increasing interest in the experiences of people who migrated in their youth during the mid-20th century and are now growing older in the UK and other European countries. This paper draws on 66 in-depth interviews with older Turkish migrants in London focusing on perceptions and experiences of long term care needs (December 2011- February 2012). The study explored the relationships between migration trajectories, personal, societal and welfare dynamics within the context of long term care (LTC) and familial responsibilities. Semi-structured interviews with older Turkish migrants (aged 55 years or more; 34 women and 32 men) reflected on identity and ageing, inter-family relationships and families, communities and state responsibilities in LTC. Turkish migrants' stories were full of accounts and examples of adjustments, compromises and nostalgia that surfaced in old age when

labour participation and feelings of 'importance' started to fade. These feelings seem to be exacerbated by limited English language skills, resulting from living in relatively closed communities and working largely in ethnic economies. Themes emerging from the analysis were consistent with expectations of 'family systems' reflecting its 'central' stage in the ageing process, as identified in earlier research identifying the importance of kinship within more collectivistic societies. However, many indicated that such family expectations are not usually met due to other commitments or different pragmatic reasons. The findings are discussed within the wider lens of migration, ageing and care; highlighting consequences of personal, societal and welfare structure and their policy implications.

## Migration, Family, Second Generations: The Challenge of Hybrid Identities

Stefania G. Meda, Università Cattolica di Milano | [stefania.meda@unicatt.it](mailto:stefania.meda@unicatt.it)

The paper illustrates the main findings of a research aimed at exploring young second-generation immigrants' migration paths, identity, family relations as well as their social and friendly relationships and their connection with school and social services. The paper also analyses second-generation youths' virtuous experiences of integration into the Italian society, in particular in school settings and local communities. The approach hereby adopted focuses on the links and social networks, which are relevant to the youths and their wellbeing, and refers to the concept of social capital. The study explores how young second generation migrants relate to their family history and how they manage their

culture of origin in relation to the Italian context. By analyzing the migration patterns and the identities of second-generation immigrant youths, the paper discusses the ambivalence experienced in the host country in relation to culture and family models. The research is based on in-depth interviews administered to key informants (experts; social workers; etc.) and 60 young immigrants aged 14-17, resident in Italy since at least two years and originally coming from Egypt, Morocco and Pakistan. Half the sample is composed by female. The contents of the interviews will also be compared to adult immigrants' narratives gathered through individual interviews and focus groups.

## Intergenerational Practices and Cultural Transmission within Italian Transnational Families in South Wales

Emanuela Bianchera, University of Oxford | [emanuela.bianchera@ageing.ox.ac.uk](mailto:emanuela.bianchera@ageing.ox.ac.uk)

Robin Mann, Bangor University | [r.mann@bangor.ac.uk](mailto:r.mann@bangor.ac.uk)

Sarah Harper, University of Oxford | [sarah.harper@ageing.ox.ac.uk](mailto:sarah.harper@ageing.ox.ac.uk)

In recent years research has increasingly addressed the roles of grandparents as providers of care in the context of ageing societies and changing family and intergenerational practices. At the same time, multigenerational family structures have been highlighted within minority ethnic communities. The role of grandparents as conveyors of cultural or ethnic identities within migrant and minoritised families however is comparatively under researched. Drawing on ethnographic research and life history interviews with families of Italian descent in South Wales, this paper pays particular attention to the role of grandparents within Italian transnational families. Italian migrant communities are typically considered to be characterized by strong kinship solidarity based on family and peer networks. The

peculiar spatial concentration of Italian multigenerational families in parts of South Wales offers insights into the dynamics of cultural continuity, negotiation and transformation with intergenerational relations. Results from our study highlight the importance of grandparents as keepers of inheritance, anchors to Italian identity and maintaining links with the motherland. Findings also point to gender differences amongst grandparents in what gets 'passed on' and how: Grandmothers place emphasis upon food culture, gathering 'around a table', and transnational care with Italian relatives and extended family bonding. In contrast, grandfathers' contribution lies in community and social roles, family businesses and cafes as family gathering points, financial transfers, the management of community and social

gatherings, as well as home and land owning in Italy, fostering regular returns.

## **b10RN13 - Family and Gender Roles 5**

Chair(s): Vanessa Cunha (Institute of Social Sciences - University of Lisbon)

### **Parent's Assistance to Adult Children – Is Gender Important?**

Vida Kanopienė, Mykolas Romeris University, Vilnius | [vidaka@mruni.eu](mailto:vidaka@mruni.eu)

The caregiving roles of women and men are one of central issues in gender identity research, besides, most studies focus on gender differences in child care and care for the elderly family members. These investigations tend to rely on quantitative data (questionnaire or time use surveys), revealing the respondents' retrospective accounts or personal attitudes, that might reflect the social desirability bias. Less attention is paid to the role of women and men in provision of assistance to their adult children in terms of care of grandchildren, financial aid, advice and emotional support. Are gender differences significant in this respect? How much are they associated with traditional gender cultures? What are structural influences? These issues are explored in a paper, basing on the Lithuanian data and analysis of findings of

qualitative survey (in-depth interviews), carried out in the framework of research project „Trajectories of family models and social networks: intergenerational dimension” during June-July, 2012 : • A total of 60 persons (30 males and 30 females, born in 1950-1955, in 1960-1965, in 1970-1975 and in 1980-1985) were interviewed – respectively 20 in each birth cohort. • Interviews (average duration 54 min) were conducted in six districts of Lithuania (15 informants in each). Intergenerational perspective, applied in research, enabled to unveil the patterns of parents-adult children relationships, comparing during two different historic periods (soviet times and the last twenty years) and to follow the changes in women's and men's roles as assistance providers to their adult children.

### **Family Strategies and Career Life-Forms in the Hungarian Elite**

Luca Kristóf, Hungarian Academy of Sciences | [kristofl@socio.mta.hu](mailto:kristofl@socio.mta.hu)

In my presentation I seek to answer the following questions: What are the typical family life-forms in the Hungarian elite, and how do they contribute to the careers of elite members? The roles played by class background, education, institutional career and network capital in entering the elite are well mapped in elite sociology. The role of marriage and family is less researched and usually appears only in social history literature. I assume that marital relationships play an important role in reaching, maintaining and

transmitting elite positions. The spouse may serve as an additional resource for an elite member, whether they pursue a traditional two-person career or act as a modern 'power couple'. As a result of my research, I expect to map what are the most important resources and types of capital related to marital relationship and family that help a spouse to enter the contemporary elite of Hungary. With the help of in-depth interviews I expect to identify typical successful routes and strategies followed by elite members and their

spouses and find the determining factors that influence these choices. With the help of quantitative elite data, I also expect to identify

longitudinal changes in career life-forms in the Hungarian elite during two decades.

## **Unequal but Content. Possible Effects of the Division of Household Labor on Relationship Quality in Three Eastern European Countries**

**Paul Teodor Haragus**, Babes-Bolyai University, Cluj-Napoca | [tpharagus@socasis.ubbcluj.ro](mailto:tpharagus@socasis.ubbcluj.ro)

Baxter and Western (1998) found that even in the face of unequal distribution of housework, wives are content and untroubled by this. Calling this phenomena a "paradox", many articles (see Claffey and Manning 2010) tried to analyze what factors explain the variation in women (or men) levels of satisfaction. Three distinctive "theories" or theoretical approaches can be used (Coltrane, 2000): "relative resources", "gender ideology" and "time availability approach". My main interest is to look at the outcomes of unequal distribution of household work. In this paper the specific outcomes are considered to be the satisfaction regarding the distribution of housework, the conflict over the distribution of housework, satisfaction with the relationship and the

thoughts of divorce. I will try to analyze if the perceived distribution of housework has an effect on the quality of the relationship, mediated by the negative outcomes. I used data from the first wave of the Generations and Gender Survey (around 2005), for three Eastern-European countries (Bulgaria, Hungary and Romania). The results show that the distribution of household labour is the main factor in explaining the variation in the satisfaction with household labour, while the latter mediates the effect on the quality of the relationship and on thought of divorce. The article tries to shed some light on the mechanism by which division of household labour influences marital quality.

## **c10RN13 - Methods and Research Techniques to Study Families and Intimate Lives**

Chair(s): Karin Wall (Institute of Social Sciences - University of Lisbon)

### **Researching the Rejected Family Model: Methodological Issues in Research of the Non-Heterosexual Families in Poland**

**Joanna Mizielska**, Polish Academy of Sciences, Warsaw | [jmiziel@gmail.com](mailto:jmiziel@gmail.com)

**Agata Stasinska**, Polish Academy of Sciences, Warsaw | [agatastasinska@wp.pl](mailto:agatastasinska@wp.pl)

**Marta Abramowicz**, Polish Academy of Sciences | [maborosi@poczta.fm](mailto:maborosi@poczta.fm)

In our presentation we would like to present methodological dilemmas connected with conducting a large research project entitled "Families of choice in Poland", starting 2013 under the direction of prof. Joanna Mizielska.

The project is aimed at showing the diversity of different relational constellations that non-heterosexual people create throughout their lives and describe their diversity in the context of the common changes in families and

intimate relationships nowadays. It is important to stress that non-heterosexual relationships in Poland still lack any formal recognition (i.e. in form of same-sex partnerships). As the recent parliamentary debate concerning the legalisation of civil unions showed, in formal discourse they are often perceived as a threat to the “traditional family”, treated as “natural” and the only right model. In the project, we will have to deal with various technical and merits-related dilemmas and constraints, resulting from such factors as: sensitive nature of many aspects of family life (as intimacy and sexuality) and non-dominant model of family life of the researched

population. During the research, various methods – both qualitative and quantitative, – will be applied. Usage of particular methods and techniques is inevitably connected with diverse problems, most important being: 1. Recruiting the subjects: relying on help of NGO’s vs. reaching beyond the network created by LGBT organizations, in an analogue and a web-based survey; 2. Collecting the data during the quantitative stage: face to face interview vs. online questionnaire; 3. Ethnographic research: ethical dilemmas connected with “reaching too far”; 4. Comprising the utmost diversity of relations and family models

## Reflections on Research Interviews in Family Research

Julia Brannen, Institute of Education, London University | [j.brannen@ioe.ac.uk](mailto:j.brannen@ioe.ac.uk)

The paper reflects on the author’s interviewing experiences with families. It interrogates the conditions in which research interviews generate storytelling. It argues that qualitative research has to engage in narrative analysis, that is to examine closely what is told (and not told) and the forms in which stories are told. The paper considers the question as to what provokes the telling of a life story and suggests that people engage with the narrative mode to some extent under the conditions of their choosing. It then examines the processes by which meaning making is achieved and made sense of by the research analyst. It analyses the initial life stories of two Irish grandfathers, drawn from a three generation study of migrant and white British fathers and sons. In

the first case the interviewee engaged with a life story mode of talk. The paper considers the story’s narrative structure; the ways in which the interviewee builds his story and the methods by which he draws in and persuades the listener. In a second case the interviewee did not engage with a life story mode or produce a clear narrative. Here the researcher created a narrative out of brief interview responses, field notes and the bare bones of a biography. It is argued that the researcher needs to compare both the talk and the biographies. This latter task involves contextualising a case in a particular historical time and place and thereby linking micro and macro levels.

## Are Drawings of Families an Indicator for Cultural-Normative Family Conceptions?

Detlev Lueck, Federal Institute for Population Research, Germany | [detlev.lueck@bib.bund.de](mailto:detlev.lueck@bib.bund.de)

Coming from the realisation that rational choice theory does not sufficiently explain changes and differences in family lives and therefore needs to be complemented with cultural explanations, a research team at the

German Federal Institute for Population Research proposes the theoretical concept of Leitbilder (cp. proposal by Gruendler, Lueck and Schiefer). It assumes that individuals have pictured conceptions of guiding role models in

mind, such as pictures of how the “normal” composition of a family or how the “perfect” timing when to have children looks like. It further assumes that these conceptions are collectively shared within societies and social groups, so that they can explain individual behaviour as well as cross-national, ethnic or socio-economic differences in family lives. Leitbilder ideally combine three characteristics that correspond to three ways of influencing behaviour: they are personally desired, they are (presumably) socially expected, and they offer a proven standard that can be chosen if no rational reflection seems possible or necessary (similar to the defaults in a software

installation). This approach is a challenge for the methodological operationalisation. Gruendler, Lueck, and Schiefer present findings from a survey that aims to measure Leitbilder by asking respondents about their personal conceptions as well as about those that are dominant in the society they live in. This way it captures two aspects of Leitbilder – what is desired and what is socially expected. This presentation attempts a second methodological approach that may detect the third aspect: the interpretation of drawings of families. Can we measure Leitbilder by asking people to draw a family? And if so, what do we learn?

## RN13 - Poster Session

### Multiple Comparison in Sociology of Family

Mikhail Basimov, Kurgan State University | [basimov@mail.ru](mailto:basimov@mail.ru)

In sociological research among the data of interrogation often present data sets of two types: nominal and interval (ordinal) variables. The problems of multiple comparison in sociological research first of all arise on a joint them when nominal variables, considered as external criteria in relation to the multiple comparison, are used for formation of groups for the multiple comparison. And interval variables as internal characteristics of the generated groups become the subject of multiple comparison of these groups. In the report is represented an application of the author's method "Multiple comparison" at the joint analysis of the data within the limits of sociological research (I.B.Britvina's data) "A Young family in Kurgan area" (230 young families were interrogated). Nominal (ordinal) data sets in four tasks of multiple comparison

became answers for the questions: 1. You have married because you ... (14 answers: 1. Fell in love; 2. Want to have children etc.). 2. What personal features attracted you in your spouse first of all? (15 answers). 3. What brings to you the greatest satisfaction in your family life? (8 answers). 4. What are the basic reasons for the conflict in your opinion? (12 answers). Also from the questionnaire for young spouses we received 19 interval scales, characterized a young family. In the report is given a substantiation of the method and the structure of representation of results of the analysis of the data is considered. The mechanism of work of two variants of a method of the multiple comparison, based on pair comparisons and the revealed authentic differences (between groups for all parameters, between parameters for all groups) is considered.

## Young Bread-Winners Challenging Established Gender Norms. Filipina Au Pairs in Norway as Mothers and Bread-Winners

Mariya Bikova, University of Bergen | [Mariya.Bikova@sos.uib.no](mailto:Mariya.Bikova@sos.uib.no)

Fleeing from years-long economic crisis, systematic underemployment and stalled gender roles, thousands of young women from the Philippines came to Norway during the last few years to work as au pairs in affluent Norwegian homes leaving behind husbands, children and parents. From Norway, the au pairs provide for their left-behind families thus becoming the main bread-winners in the family. This however challenges the established cultural gender norm of a male bread-winner. Based on mobile multi-sited ethnographic fieldwork in Norway and the Philippines, and approaching the Filipino au pair-migration with the notion of global care chains, the paper seeks to explore how the

participation in the scheme influences the lives of the au pairs, their left-behind family members and local communities in the country of origin. Interviews with au pairs and persons, who have been au pairs, reveal how the family lives of the migrants have changed, who takes care of the au pairs' children and parents, and how, if at all, gender roles have been reconstructed as a result of migration. 'Following' the au pairs to the villages and local communities they come from allows for exploring how the left-behind family members experience being part of the au pair-migration, how the remittances from Norway have been used and how the absent migrant is present in the local communities.

## New Fathers or Breadwinner? A Picture of Men, Fathers & Work in Italy and Europe

Maria Letizia ML Bosoni, Catholic University of the Sacred Heart of Milan | [marialetizia.bosoni@unicatt.it](mailto:marialetizia.bosoni@unicatt.it)

Identity transformation process - for both men and women - and structural changes in the family and in the labour market lead to consider the role of the "new fathers" and the practices related to fatherhood. In the post modernity era, gender roles are facing an important change. In traditional (pre-industrial) society, male and female tasks were clearly separated, with women mainly dedicated to child care and domestic tasks and men to paid work and considered as the "pater familias". This representation began to change in the post modernity era and the term "new fathers" emerged to describe fathers as more involved in the care of children. Several empirical studies highlight, in fact, a transformation of the father role, both in Italy and in the wider international context, which

implies a "more involved" and "new" father style. Nevertheless the strong relation with job remain a pivotal trait shaping men identity as the breadwinner model is still a cultural feature in many European countries (ex. in Italy). This presentation is aimed to understand the transformation in male identity and paternity taking into account the strong relation with the job for men. The Italian situation will be analysed through data from the European Values Study (EVS), whose fourth wave was conducted in Italy in 2009 (and in other European countries, for a total of 47 countries). The EVS survey allows to capture structural aspects and values concerning fundamental aspects of life, such as family and marriage, work, free time, religion, education and children socialization.

## RN14 - Gender Relations in the Labour Market and the Welfare State

### 01RN14 - In/Formal Care and Work

Chair(s): Áine Ní Léime (National University of Ireland , Galway)

### Neoliberal Health Policies Impacts on Nursing in Turkey : A Comparison between Vocational Nursing School and University Graduates

Rana Cavusoglu, Middle East Technical University, Ankara | [rana9.cavusoglu@gmail.com](mailto:rana9.cavusoglu@gmail.com)

Fatma Umut Beşpinar, Middle East Technical University, Ankara | [umutbespinar@gmail.com](mailto:umutbespinar@gmail.com)

Nursing has been influenced by social, political and economy as well as by technology across the world. It is possible to observe the similar way of transformations in Turkey equally with world at the same time. Turkey is a developing welfare state with immature forms of health policies. Whilst it is possible to observe provision of neoliberal health policies in Turkey, nursing has also undergone to rapid transformations in terms of being a traditional activity to an institutionalized occupation at the same time in years. Neoliberal policies also have impact in transformation of nursing leading nurses to be more submissive in health labor market in regarding to nurses' perception towards reproduction of self-identity in nursing and nurses' work experiences due to immature neoliberal health policies implications. Various educational

levels in nursing in Turkey cause to different forms of understanding of neoliberal health policies impacts on nursing in Turkey. In this framework two groups of nurses were selected for in-depth interview. The field research has been done between the two nursing cohorts: The first group was experienced nurses who were educated in vocational nursing schools and the young graduate nurses who were university graduated. The experienced women nurses had at least 20 up to 30 years work experience and young graduate women nurses had at least 1 up to 3 years work experience. The study aimed to examine two groups perceptions towards neoliberal health policies impacts on nursing in relation to level of their educations, work experiences and reproduction of self-identity in nursing.

### Informal Elderly Care and the Life-Course: Lives of Women Caring for their Frail Elderly Mothers

Radka Dudova, Institute of Sociology, AS CR | [radka.dudova@soc.cas.cz](mailto:radka.dudova@soc.cas.cz)

In my paper, I present the results of a qualitative research of informal elderly care in the Czech Republic, using biographical method combined with constructivist grounded theory approach. I analyse the impact of the caring

(several months or years of day-to day care including intimate bodily care) on the life-courses of women care-givers (especially work and family careers). I draw on the analysis of 20 life-stories narrated by women who are or

were in the recent past informal carers of their elderly mothers. The narratives show how the decision whether to take on the duty of informal care or not, the practical organisation of this care as well as the impacts of the care on the lives of the women depend of the timing of the need for care in their life-course. Usually, the period of caring was situated in their late fifties and sixties – in the phase of life when they still worked, they did not have anymore caring responsibilities towards their children (and often they did not have any grandchildren yet), and they still were in good health. After the care was no longer needed,

they realised that they entered the old age without noticing it – they started to have health problems; due to the example of their mother's ageing they became aware of the transience of the "good health"; and they moved to the top of the "generation pyramid" in their family. In this perspective, the period of care for an elderly parent can be considered as a transition period emerging in the life-courses of women. For several reasons, the death of their mother could be considered as the point of transition to the old age, rather than for inst. the retirement that proved to be very fluid and uncertain.

## Who and in Which Conditions Cares for "Grannies" in Crises Times?

Paloma Moré, University Complutense Madrid | [mmore@ucm.es](mailto:mmore@ucm.es)

How the consequences of the economic crisis are transforming the care work for older people in Spain? The cutting budgets and the precarisation of working conditions present a depressing panorama for care and domestic workers in Spain: Salaries in domestic work are falling down and rarely employers obey the new labour rights that, following the ILO recommendations, domestic workers have recently acquired in Spain. In general working conditions are becoming worse. In addition, budget cuts are modifying widely the working conditions when care is mediated by the local authorities. As a result of cuts, the authorities have to select more carefully the beneficiaries according to their degrees of health dependency and the job of care assistants is becoming harder. Taking into account that

most of care and domestic workers are migrant women other relevant questions can be asked further: What impact is having the crisis context over their labour trajectories and gender and family arrangements? Which strategies for resistance are they able to develop? Do they have to compete with new profiles of workers as migrant men or native women? This paper present some preliminary results of my doctoral fieldwork based on a qualitative study conducted in Madrid. The results hold on 25 in-depth individual interviews to domestic and care workers and key informants; four collective interviews and two focus groups with domestic and care workers and participant observation over an association of migrant care workers women.

## 02RN14 - Gender Perspectives on Working Time

Chair(s): Evelyn Mahon (Trinity College, Dublin)

### Mothers' Working Times in 22 European Countries

Milla Salin, University of Turku | [milla.salin@utu.fi](mailto:milla.salin@utu.fi)

It has been stated that women's and mothers' presence in workforce is nowadays presented necessary in order to promote economic growth, tackle poverty and further gender equality. Mothers' labour market behaviour has also been studied widely. (E.g. Björnberg 2006; Lewis 2009.) However, quantitative studies on country-level factors – such as economic situation's, labour market conditions', family policy's, women's breadwinner tradition's as well as norms and values' – roles on mothers' working times have been examined more rarely (see Steiber & Haas 2009; Abendroth et al. 2012). In this study mothers' working times in 22 European countries are under examination. Focus in on three questions: 1) How mothers' working times differ between countries?, 2) How mothers' working times differ from working times of childless women and fathers?, 3) Which individual- and country-level factors

explain mothers' working times?. Data used is the ESS data 2010/2011. Research methods include descriptive methods and multilevel modelling. Preliminary results show that mothers' working times vary significantly between countries. In Eastern and Southern European countries and in Finland mothers' working times are polarised: mothers are either not working at all or they are working full-time hours. In Denmark, Sweden, Norway, France and Belgium vast majority of mothers are working long part-time or full-time hours. Third country-group includes Germany, Ireland, the Netherlands, Switzerland and United Kingdom where short part-time hours are more prevalent than in other countries. In these five countries mothers are also working clearly less than childless women and fathers. Results of multilevel modelling are not yet available.

### Work-Life Articulation in Light of Women's Social Uses of Part-Time Work: a Comparison Between France and Italy.

Valeria Insarauto, EHESS | [valeria.insarauto@gmail.com](mailto:valeria.insarauto@gmail.com)

A new stream of research on work-life articulation carried out in the 2000s opened new perspectives on the studying of part-time work by pointing out the growing diversification of part-time work social uses and of the groups of workers concerned by this employment form. Accordingly, part-time work could be seen as becoming progressively more respondent to individuals' necessity of arranging a broader articulation between work and extra-work activities over the life-course. However, the use of part-time work for family

reasons remains the most widespread and it continues to represent a crucial element to the segregation that characterizes the employment trajectories of women as compared to those of men. In this study we propose to investigate the logics behind the strong feminization of part-time work in light of women's social uses of part-time work as the main indicator of such ambivalence. A comparative, explanatory and secondary data analysis aimed at depicting changes in women's part-time work uses over the 2000s

in France and Italy is developed. A micro-perspective is adopted, with particular reference to individuals' socio-demographic and work-related characteristics. The investigation draws on the Labour Force Survey of each country dated between 2003 and 2010, which data are analyzed mainly in a pseudo-panel perspective. The examination of

women's practices with respect to part-time work uses reveals that such practices are an important drive behind the changes that take place within institutional and socio-economic backgrounds differently determined by constraints and opportunities, and incapable of framing and fastening new logics of part-time work development.

## **Working Part-Time or Marginal Part-Time after a Long Family Related Employment Interruption: First Steps towards Full-Time Employment?**

**Susanne Goetz**, Institute for Employment Research | [susanne.goetz@iab.de](mailto:susanne.goetz@iab.de)

**Katharina Diener**, Institute for Employment Research | [katharina.diener@iab.de](mailto:katharina.diener@iab.de)

**Franziska Schreyer**, Institute for Employment Research | [franziska.schreyer@iab.de](mailto:franziska.schreyer@iab.de)

Compared to other European countries the German labour market up to now has hardly been affected by the crisis ('Germany's job miracle'). However, for the future a demographically induced skills shortage is expected in Germany. Furthermore the adult worker model gains in relevance, which means that every person should participate in the labour market. Step by step this model displaces the 'traditional' male-breadwinner model and questions the division of unpaid family work between women and men. Against this background, women reducing or giving up their employment in order to assume unpaid family work are supported to return back into the labour market. Our mixed-methods study examines the process of women's re-entry after a longer absence in order to take care of children or older family members. We

conducted panel telephone interviews with participants of the model program 'Perspective Re-entry' that has been launched in 2009. 30 women were selected for biographical narrative interviews. After the women's participation in the program about 60 percent of them have been employed again. But they mainly work in (marginal) part-time jobs. What are the reasons for missing the model program's target helping women into at least nearly full-time employment? The biographical narrative interviews show that women opt for part-time employment as they try to keep a balance between work and life, but furthermore interpret it as a transition to almost full-time jobs. Finally we will present results from the quantitative study answering the question whether this hope can be fulfilled.

## **National Transfers and Time Use for Spain**

**Rosario Scandurra**, University of Barcelona | [rosario.scandurra@gmail.com](mailto:rosario.scandurra@gmail.com)

**Elisenda Renteria**, University of Barcelona | [elisenda.renteria@gmail.com](mailto:elisenda.renteria@gmail.com)

When it comes to value people well being, time use is still a hidden dimension, since it is excluded from national accounts. Value of time use is important to satisfy household members' necessities. The System of National

Accounts considers production activities from market transactions. The exclusion of unpaid housework from national account leads to an underestimation of the value of total production, particularly that provided by

women. The lack of visibility of the economic contribution of women perpetuates gender inequality (Waring, 1999). The introduction of time transfers in the analysis is not an easy task, and that is the main reason that the use of time has not been widely used. Recent production of time use surveys has facilitated the growth of studies on this topic (Folbre, 2004). This literature shows that in most cases, adult women, especially since the moment they are mothers, spend more time doing domestic production. This is particularly marked in Europe among Mediterranean countries that

have a greater time differential between men and women engaged in housework. The goal of this article is to identify the productive activity in the Time Use Survey in Spain for 2009, assigning a monetary value to domestic production activities in order to make them comparable with the "classic" models of production activities, based on the market. Then, it will be estimated the age and sex specific profiles of time consumption and time production, comparing these profiles of time and measuring their surplus or deficit by sex and age.

## **a02RN14 - Crisis Care and Occupational Segregation**

Chair(s): Nata Duvvury (National University of Ireland Galway)

### **Mediterranean Women on the Edge of the Crisis: Comparing Italy, Spain and Greece**

**Mariella Nocenzi**, Sapienza University of Rome | [mariella.nocenzi@uniroma1.it](mailto:mariella.nocenzi@uniroma1.it)

**Denise De Marco**, Sapienza University of Rome | [denise.demarco@uniroma1.it](mailto:denise.demarco@uniroma1.it)

According to the most recent studies on the gendered impacts of the crisis, three are those that are strengthened in the Western countries: downward levelling of gender gaps in employment, wages, working conditions, and poverty; the increasing similarities in labour market behaviour between men and women; the paradoxical uneven retrenchment in welfare and social security provisions. Some other impacts are registered in the first and second phase of this five-years crisis that have alternatively favored or penalize women – as the sheltered women's employment, activity, and, to an extent, pay in public sector jobs against the temporary and other atypical employment contracts for women. At this moment it's necessary to learn by the crisis for

reforming the social policies and the economy with a gender approach. In particular, the analysis of the three specific case studies – Italy, Spain and Greece – criticizes the prevailing recommendations come from the crisis experience as, among them, the reconsideration of the indicators of gender equality, the encouragement of the States to adopt effective gender budgeting routines for main policy initiatives, the closely monitor of the risk that fiscal consolidation erodes welfare provisions, the addressing of the disproportionate burden of employment flexibility on young people and the facing of the issue of the poor integration of mobile and migrant workers, especially men.

## In the Middle of Production and Reproduction: Young Female Labour in Economic Crises Conditions in Turkey's Labour Market

Canet Tuba Saritaş Eldem, Hacettepe University, Ankara | [canettuba.saritas@hacettepe.edu.tr](mailto:canettuba.saritas@hacettepe.edu.tr)

In accordance with the experiences of women in many countries, female labour, but particularly young female labour, is more vulnerable to redundancies than male labour in economic crisis conditions in Turkey's labour market. Young women who have somewhere to go (home), something to do (domestic chores) and who are financially supported by a man (father, husband) are perceived more suitable candidates for redundancy by employers with respect to male breadwinner ideology. Employers do not hesitate to be in favour of maintaining the superiority of men over women because as flexible reserve army of labour young women contribute to recovery in economic crises conditions inside of the household by their reproductive duties and in the labour market

by accepting precarious employment patterns. Even if employers make displacement decision by considering working performance, it does not emancipate young women from patriarchal capitalist hobble due to the impact of the conflict between work and family responsibilities hindering young women's working performance and making them vulnerable to redundancy. Within this framework, this study questions the impact of economic crises on young women's employment in Turkey's labour market by focusing on women's role in production and reproduction. This examination is based on 48 semi-structured in-depth interviews conducted with 32 unemployed young women and 16 employers in the direction of the feminist methodological standpoint.

## "Individual and Structural Barriers of Labor Market Integration of Female Migrants in Styria"

Lydia T Roessl, Danube University, Krems | [lydia.roessl@donau-uni.ac.at](mailto:lydia.roessl@donau-uni.ac.at)

Anna Faustmann, Danube University, Krems | [anna.faustmann@donau-uni.ac.at](mailto:anna.faustmann@donau-uni.ac.at)

Gudrun Biffl, Danube University, Krems | [gudrun.biffl@donau-uni.ac.at](mailto:gudrun.biffl@donau-uni.ac.at)

Isabella Skrivanek, Danube University, Krems | [isabella.skrivanek@donau-uni.ac.at](mailto:isabella.skrivanek@donau-uni.ac.at)

„Individual and structural barriers of labor market integration of female migrants in Styria" Women who want to take up employment are often confronted with multifaceted problems. This is one of the results of the evaluation of eight pilot projects chosen in line with the European Social Funds priority 3b (2010-2011), active labour market policy measures with a focus on migrants distant from the labor market. On the one hand it was part of the research to evaluate the effectiveness of the project methods to increase employability and to integrate people

in the labor market. Furthermore it was aim to identify problems on the individual and structural level that are barriers to employment. The chosen method-mix of quantitative (participant data base) and qualitative methods (observations and qualitative interviews) allowed us to consider the Micro- (participants), Meso- (projects) and Macro-level (economic and labor market system) and to combine the results of all perspectives. There are individual challenges that can only partly be attributed to the migration experience of people. Especially

women living in rural areas have to deal with lacking social services, missing infrastructure and limited employment opportunities. For migrant women there are even further challenges, like little knowledge of the German language, missing credentials and proof of working experience. As result of the research

several aspects and methods were especially for the labor market integration of women supportive, like targeted qualification and further training, visualization of qualifications and competences, support of sustainable regional mobility concepts, provision and strengthening of social services.

## **Segmented Labour Markets and Female Labour Force Heterogeneity: Unexpected Outcomes in Times of Crisis**

**Alberta Andreotti** , University of Milan-Bicocca | [alberta.andreotti@unimib.it](mailto:alberta.andreotti@unimib.it)

**Ivana Fellini**, University of Milano-Bicocca | [ivana.fellini@unimib.it](mailto:ivana.fellini@unimib.it)

The paper deals with the impact of the crisis on women's labour force in the North and South of Italy under the hypothesis that female profiles are heterogeneous and that these profiles have been differently penalized in the two macro-areas. The paper is divided in two sections. In the first, we investigate the female heterogeneity in the Italian labour market adapting the well-known female typology based on the preference theory that distinguishes work-centered, family-centered and adaptive women. On the basis of the Italian Labour Force Survey, we build up different female profiles stemming out from women's commitment to work, wondering whether there are dissimilarities in their distribution and composition in the North and South of Italy. We

will show that the profiles assume different (counterintuitive) features in the two macro areas. In the second section, we assess the impact of the crisis on the different women profiles and we show how some of them have been more affected than others. We argue that the peculiar adjustment of the Italian labour market to the crisis (e.g. employment de-qualification, unfriendly part-time, and forced commitment) selectively penalizes women with both stronger and lesser commitment to work, with unexpected outcomes in the North and South in terms of traditional gender division of labour and familistic welfare model. The analysis is based on the Italian Labour Force Survey cross sectional and longitudinal data covering the pre and post crisis period.

## **03RN14 - Policy: Care Leave**

Chair(s): Peggy McDonough (Dalla Lana School of Public Health - University of Toronto)

## **Childcare Policies in Turkey: Empowering or Entrapping Women?**

**Fatma Umut Bespinar**, Middle East Technical University | [bespinar@metu.edu.tr](mailto:bespinar@metu.edu.tr)

**Ayşe İdil Aybars**, Middle East Technical University | [aybars@metu.edu.tr](mailto:aybars@metu.edu.tr)

Work-life balance and care policies are the most significant elements of attempts to raise women's labour force participation, on the one

hand, and to improve child wellbeing, on the other. As a country with very low levels of women's labour force participation, along with

a conservative approach to family, there has been an increasing emphasis on policies to improve childcare services in Turkey, particularly as part of its European Union accession process. The rationale behind such policies in many European welfare states today is to increase women's participation, or to improve their position, in the labour market and to stress the importance of institutional care for child development. As a country undergoing significant economic and social transformation, however, Turkey focuses on childcare mainly through the lens of family, as a tool to stress family's central role in child development. This paper examines policies targeting work-life balance and care in Turkey,

as a country which is not as severely impacted on by the current economic crisis as other European countries, but which has nonetheless been experiencing a significant transition in economic and social policies for the last 10 years. It traces the development of these policies in the last 10 years, which witnessed the increasing implications of a conservative approach to work-life balance policies on the basis of a conceptualization of women mainly in terms of their role within the family as mothers and care providers. It questions if work-life balance policies, conceptualized in this way, have the potential to improve women's labour force participation while empowering both women and children.

## Negotiating Parental Leave: Competing and Gendered Discourses

Anette Borchorst, Aalborg University | [ab@dps.aau.dk](mailto:ab@dps.aau.dk)

Lotte Bloksgaard, Aalborg University | [bloksgaard@cgs.aau.dk](mailto:bloksgaard@cgs.aau.dk)

The Danish debate on parental leave has been subject to considerable changes during the past 50 years, and during this period the position of women vis-a-vis the labour market has changed drastically. Before the 1970s, care of children was considered a natural and biological female task, but gradually notions of the caring father have become more prevalent. Still, parenting has been based on a tacit understanding of mothers being the central care figure of the small child, and the issue of earmarking part of the leave for fathers has been controversial in Denmark and gender equality has not been considered legitimate policy logic. The paper first presents a discourse perspective as the theoretical and methodological approach for understanding

debates and negotiations on parental leave. In the following sections, changing and competing discourses on parental leave are analysed on two different levels; political debates and negotiations between fathers and mothers in the family context. A discursive approach is used to explore how parental leave are perceived and articulated – by different actors at the two levels. With regard to the first-mentioned we focus primarily on the historical changes in the political approach to parental leave whereas categorizations of interacting or competing discourses and representations are in focus in the last mentioned. At both levels tacit understandings and 'silences' and gender

## The Relationship of Care and Work in East and West Germany over Time - Continuity or Change?

Christin Czaplicki, Munich Center for the Economics of Aging | [czaplicki@mea.mpg.de](mailto:czaplicki@mea.mpg.de)

Tatjana C. Mika, German Federal Pension Insurance | [Tatjana.Mika@hotmail.de](mailto:Tatjana.Mika@hotmail.de)

Social care and how it is provided has become an important indicator in comparative welfare research (Daly/Lewis 2000). As long as the male breadwinner model prevailed in Western Europe there was the assumption that women would undertake care responsibilities. The German case is particularly suited for examining the influence of historical, political and economic characteristics of welfare systems on the life courses of caregivers and thus the relationship of care and work. While in East Germany lifelong full-time employment was nearly obligatory for women, in West Germany most women were either not gainfully employed or worked part-time. In light of these career traditions the hypothesis can be proposed that even after re-unification the proportion of East German women who are gainfully employed and undertake care

responsibilities at the same time will be higher than among West German women. This paper deals with the question which differences in the combination of care and work can be observed between East and West German women of different birth cohorts after re-unification. For that purpose we use longitudinal data from the German Pension Insurance which comprise information on informal care and employment on a monthly basis since 1995. We compare two distinct birth cohorts (group 1: 1948-1952, group 2: 1968-1972) and the labour market participation during the caregiving period. The results give insights in the relationship of care and work in Germany and illustrate the need to improve the compatibility of family and work responsibilities.

## Policy Process and Fathers' Parental Leave: The Role of the Tripartite Negotiations in Finland

Minna Salmi, National Institute for Health and Welfare (THL), Finland | [minna.salmi@thl.fi](mailto:minna.salmi@thl.fi)

Johanna Lammi-Taskula, National Institute of Health and Welfare (THL), Finland | [johanna.lammi-taskula@thl.fi](mailto:johanna.lammi-taskula@thl.fi)

For decades, the aim of Finnish leave policy has been to reach a more equal sharing of parental leave by encouraging fathers to take more leave. In spite of this longstanding goal and policy redesign, Finnish fathers' take-up of parental leave has increased slowly and fathers use only 8 % of all parental benefit days. This paper asks why more fathers do not use more parental leave. Previous research locates obstacles for father's more active leave take-up to family economy, pressures from work and the tradition of the gendered division

of labour. In this paper our main focus is on the role of the policy process which structurates the leave schemes and, eventually, the take-up of leave. In Finland leave policy development is part of the working life policy design where the social partners play a significant role. Law drafting to regulate leave policy schemes relies on unanimous decisions in the tripartite negotiations between the central employer and employee organisations and the government. The policy analysis is based on our evaluation of governmental policy documents on parental

leave 1995–2011 and on participatory observation of the policy process. The goal of promoting gender equality is presented in the documents but it is not the main interest of the tripartite negotiations. We conclude that the obstacles for fathers' parental leave are to be found not only in factors at the individual level

but also in the structuring of leave schemes which has not actualised the goal of improved gender equality. An important explanation for this is the special Finnish policy making process where the schemes are developed as compromises between the negotiating parties.

## 04RN14 - Economic Crisis and Gender Equality I

Chair(s): Emma Calvert (Queens University, Belfast)

### Good State, Bad State: Welfare Capitalism, Austerity and Gender Equality

Hazel M Conley, Queen Mary University of London | [h.conley@qmul.ac.uk](mailto:h.conley@qmul.ac.uk)

Feminist theories of the welfare state have identified the contradictory position of the state in relation to women. The good state provides jobs, welfare benefits, public services, and equality legislation that can serve to dismantle traditional male breadwinner models of gendered social relations. However economic crises inevitably serve to highlight the fault lines in the position of women in welfare capitalism. The overwhelming response to the current economic crisis is for governments around the globe has been to reduce public spending to levels where jobs, welfare benefits and public services have been lost in unprecedented numbers in the name of austerity. The gendered effects of austerity measures are becoming widely documented but little has been reported on the ability of equality legislation to protect women from

disproportionate impact. This paper examines the UK case where equality legislation put in place just as the full effects of the crisis were being realised should have offered women protection from disproportionate impact of austerity measures. However less than a month after the new legislation was put in place there was a change of government. The new coalition government was defined by a zeal for austerity and a view that equality legislation is simply 'red tape'. The paper provides a detailed analysis of the legislation and the political interventions in its implementation. In addition an analysis of key cases where the equality legislation has been used to challenge government austerity measures with varying degrees of success is considered.

### The Daisy Model. Theorizing Relations between Households and their Environment.

Daniel Bertaux, Centre National de la Recherche Scientifique (CNRS) | [daniel.bertaux@misha.fr](mailto:daniel.bertaux@misha.fr)

While most homeless persons in Europe are men, statistical comparisons do show that more women than men live in precariousness.

Cross-national European research comparing cases of people living in precarious conditions in large cities has shown that the more

developed are Welfare institutions of solidarity (mutualising risks through State-wide insurance systems) as in Scandinavia or France, the better the situation of all types of women; including single mothers. The most interesting part of this comparative project has been fieldwork research providing insights into the mechanisms generating and re-producing gender inequalities. Gösta Esping-Andersen, our “common ancestor” of sorts, proposed in 1990 to focus not on one inequality-generating mechanism at a time, but on the combination of labour markets, Welfare institutions writ large (he should have included the French *maternelles*), and “the household”. Legitimate feminist criticism (e.g. Jane Lewis) led him

later (1999) to admit having forgotten to focus on “the household”; but he did not offer a convincing alternative. We believe indeed that the workings of “the household” do play a key role in generating/reproducing gender inequalities: not only through its inner workings however, including assignation to parenting and eventual domestic violence, but also through its “outer” workings. That is, through its relations with local labour markets and institutions. We propose a figurative model (the so-called “daisy” model) of the relations that any household necessarily develops with them. This “outer” domain also seems to be the realm of most women’s recent advances.

## Tracing the Invisible String of Inequality: Female Employment and Household Income Inequality in Spain

**Maria O Salido**, Complutense University of Madrid | [olga.salido@cps.ucm.es](mailto:olga.salido@cps.ucm.es)

In this paper we analyze the impact of growing female employment on household income inequality, across the recent phases of the economic cycle. Although this topic has been mostly addressed trying to assess the effect of female additional income on the general behavior of the household income distribution, this paper tries to take the point from sociological strands, exploring the underlying socio-demographic processes that help to explain recent trends in income inequality among households. In this respect, Spain as an outstanding case for study, combining: (a) an

unprecedented upsurge in female employment figures over the recent expansive phase of the economy, double-sizing the figure of females in employment from 4 to 8 million; and (b) a countertendency evolution of the Gini Index, keeping aside of the general trend towards growing inequality experienced by most developed countries along the expansive period. The paper also explores the eventual effect of the crisis on this relationship, testing the strength and persistence of the previous changes. The analysis is carried out with the EUSILC data (2004-2012).

## Gender Regime and Welfare State: Esping-Andersen Typology in Today’s World

**Nata Duvvury**, National University of Ireland, Galway | [nata.duvvury@nuigalway.ie](mailto:nata.duvvury@nuigalway.ie)

**Aine Ni Leime**, National University of Ireland, Galway | [aine.nileime@nuigalway.ie](mailto:aine.nileime@nuigalway.ie)

Esping-Andersen has been a critical influence in thinking of the welfare state and its interaction with gender regime. While feminists questioned his framing of different types of welfare states bringing nuance to his categorization, discussion on the welfare state

is still within the constructs of his typology. In the period since Esping-Andersen’s typology first came to the fore, there have been some major shifts in the labour market, the social contract, and resource-base of the state that potentially raise questions around the

relevance of the framework. First and foremost is the increased precarity of employment for women and men. Can we then talk of a main breadwinner? A second dynamic is the increasing emphasis on personal responsibility rather than state obligation in addressing poverty. More starkly, vulnerability is framed as an outcome of personal habits and risks than of structural inequalities. This raises the question of whether the role of state is then providing security in the narrowest of senses. A third dynamic is the growing concern of

structural debt with resources continually insufficient to meet expenditures. Whose needs are prioritized in a shrinking or unstable resource-base?? This paper firstly includes a conceptual discussion of Esping-Andersen typology delineating the assumptions of the model. It proceeds to a review of literature to establish critical trends in the labour market, social contract, and shrinking resource base. The final section of the paper discusses the relevance of the Esping-Andersen framework in the context of these trends.

## **a04RN14 - Mid-Life and Older Workers**

Chair(s): Milla Salin (University of Turku)

### **Older Female Workers in Southern Europe: between Care and Paid Work**

Tania Toffanin, University of Padova | [tania.toffanin@unipd.it](mailto:tania.toffanin@unipd.it)

The condition of female workers is usually analyzed by focusing the issues concerning the 25-49 age group. The analysis of the condition of older workers has been neglected for a long time. Then the changes occurred in family structure, especially related to the decline in household size has encouraged many women to go on working in paid work rather than devoting to domestic and family care work. The reforms introduced both into the pension system and in labour market have caused a shift in retirement-age also for women while work discontinuities have increased for all age groups. In Southern European countries such as Italy, Spain, Portugal and Greece these reforms have been launched without the increasing of provisions of public services in order to reduce the care work. In those countries older women workers, aged 55 and

over, are coping with a sort of “four-time presence”: the first one is associated to paid work, in the labour market because of the shift in retirement-age; the second one is related to the care of children even if they are adult because of the enlarging unemployment; the third one is connected to the care of their grandchildren because of the inadequacy of public services; the fourth one is concerned with the care of elderly people in the household. This paper aims to deepen the condition of older women at work and highlight the peculiar relationship existing between the structure of the labour market, the pension schemes and the unbalanced division of domestic and care work within the household. The analysis will present a theoretical framework and a comparative approach based on relevant statistics about this issue.

## Gender Differences in Post-Retirement Work and Pension Planning in Germany and the UK

Anna Hokema, University of Bremen | [anna.hokema@zes.uni-bremen.de](mailto:anna.hokema@zes.uni-bremen.de)

It is well known that European labour markets are gender segregated and family caring responsibilities are unequally divided between men and women which also shows in marked gender differences in pension provision. However, little is known about the experiences of men and women working beyond state pension age. Using qualitative data, I will analyse the subjective reasons for post-retirement work as well as individual pension planning over the life course in Germany and the UK. Special emphasis will be put on the analysis of how gender roles and the male-breadwinner model ingrained in the national welfare state regimes influence the experience of working in retirement. Preliminary analysis shows that some gendered features of the German and British pension systems and labour markets, such as women being less often enrolled in occupational pension

schemes or women working more often in part-time jobs across the life course, lead to different experiences of working in retirement for men and women but also across the two countries. Especially divorced women name financial reasons more often than married women, and men in general. Divorced men name the absence of a partner and social contacts as reasons for their post-retirement work. Another finding is that female working pensioners do not experience reaching the state pension age as such a significant event than male working pensions, this could be due to the their already discontinued working careers. The data shows that the life phase of old age becomes more and more heterogeneous, where working in retirement is not an uncommon feature, and not exclusively due to economic reasons.

## Social Inequalities in Women's Health at Mid-Life: Pathways of Cumulative Disadvantage in a Comparative Perspective

Peggy ` McDonough, University of Toronto | [peggy.mcdonough@utoronto.ca](mailto:peggy.mcdonough@utoronto.ca)

Diana Worts, University of Toronto | [dwords@gmail.com](mailto:dwords@gmail.com)

Cara Brooker, University of Essex | [cbrooker@essex.ac.uk](mailto:cbrooker@essex.ac.uk)

Anne McMunn, University College, London | [a.mcmunn@ucl.ac.uk](mailto:a.mcmunn@ucl.ac.uk)

Amanda Sacker, University College, London | [a.sacker@ucl.ac.uk](mailto:a.sacker@ucl.ac.uk)

We examine the social gradients in general and mental health at mid-life for British and American women. Drawing on the life course perspective, we investigate these gradients with reference to the advantages and disadvantages that cumulate across women's lives, from childhood through the prime working and family caregiving years. Our comparison of the US and Britain draws on

feminist welfare state theory to speak to the role of welfare state provisions in moderating the cumulative effects of individual-level circumstances on women's mid-life health. We use data from the US National Longitudinal Survey of Youth 1979 and the British National Child Development Study. Our analysis employs a range of measures of early-life disadvantage, along with detailed longitudinal

information on women's employment, partnership, and parental circumstances over the ages of 25-49 years. The results show, for both countries and for several early-life disadvantages, the expected social gradients in health at mid-life. Importantly, though, there is evidence that the gradients grow steeper over the life course because disadvantages cumulate. That is, certain early-life disadvantages select women into health-compromising work-family biographies and/or

out of health-enhancing biographies, thereby compounding the health effects of early-life disadvantages. Moreover, we find evidence that welfare state provisions matter: the cumulation of disadvantage as it applies to mid-life health is greater in the US than in Britain—dramatically so in the case of mental health. We discuss the implications of these country-specific pathways for theory and research on social inequalities in health.

## Comparing Women's Pension Income in the UK and Spain: Inequalities among the Retired Women.

Eva Martinez Cruz, University of Surrey | [e.martinez@surrey.ac.uk](mailto:e.martinez@surrey.ac.uk)

International pressure for reducing the role of the welfare state across Europe and the increase of “private” (often tax-subsidized) pensions is resulting in major welfare reforms cross-nationally. This agenda of pension reforms has included measures to improve how pension policies deal with gender differences in pension income and there is evidence that the reforms will bring greater gender equality, at least in state pensions. Yet, the lack of retrospective application of reforms of this nature on pension systems might be creating income inequalities between age cohorts of retired women; the oldest being worse off than recently retired. This paper explores age cohort differences in pension income among women comparing two different pension regimes, Spain and the UK. It analyses cross-sectional data based on the latest waves

(2010) from the ELSA and SHARE surveys; analysing 1373 retired women for Spain and 3828 retired women for the UK. The analysis considers three age groups of women to allow age cohort comparisons (60-69, 70-79 and 80+). Logistic regressions compare the impact of age and pension regime among women in Spain and the UK, while adjusting for other variables. The paper suggests that increasing age has a greater impact on women's pension income in the UK than in Spain. However, there are interactions with older women's socio-economic position and marital status, which need to be taken into account. This indicates that other variables such as marital status or social category are important factors when exploring pension income among retired women in different welfare states.

## 05RN14 - Masculinities

Chair(s): Peggy McDonough (University of Toronto)

### Local Age Hierarchies and Masculinities in Change: On Older Workers in Manual Labor

Clary Krekula, Karlstad University | [clary.krekula@kau.se](mailto:clary.krekula@kau.se)

In response to ageing populations, many European countries have extended working life through delaying the statutory age for retirement. Physically demanding work is a particularly challenging issue to address in relation to this. Studies have also shown that the age dimension is more or less present in many workplaces and is particularly tangible in male-dominated workplaces with heavy physical labor. In this paper I discuss the practices that position older employees in age-based hierarchies within male-dominated professions involving heavy labor, by means of exploring data from the Swedish fire service. These workplaces have also been described as the scene of an ongoing negotiation between orthodox and inclusionary masculinities. While the political debate has focused on gender equality, age relations within the group of male fire-fighters have not been paid attention. My

analyses are based on written comments that were provided in conjunction with questions in a survey conducted among 1176 employees at 25 randomly selected fire stations. The results illustrate that physical strength is here used to draw a line between different age groups. In some cases older fire fighters can be assigned alternative work when they are unable to work in heavy smoke, which gives them the possibility to continue in their profession. At the same time, these shifts can lead them to a lower position in the age hierarchy. The category of older is however constructed contextually and in relation to local aspects, such as the number of employees, and the age distribution of the staff. This indicates that age hierarchies can vary and be locally grounded, and it is therefore reasonable to speak of local age hierarchies.

### Working-Class Men, Masculinities and Wellbeing in Contemporary Russia: Negotiating Breadwinner Roles after the 'End of Work'

Charlie Walker, University of Southampton | [charlie.walker@soton.ac.uk](mailto:charlie.walker@soton.ac.uk)

This paper examines sources of, and barriers to, wellbeing amongst working-class men in contemporary Russia. It is based on ethnographic research carried out in Ul'yanovsk over a nine-year period (2004-12), with almost a hundred male participants over three research projects. During the 1990s men in Russia, and working-class men in particular, were regarded as a highly problematic group, with high levels of psycho-social stress and connected risk-behaviours such as alcoholism being seen to underpin premature mortality

and high morbidity rates. On the whole, such stress and risk behaviours were largely attributed to men's inability to cope with their newly marginal status in the labour market, which brought both material loss and loss of status (Ashwin and Lytkina 2004). The present study argues that this position sees men as culpable because of their own deficits, diverting attention from the wider structural factors shaping their experiences. Despite the low-pay and low-status nature of their jobs, men in Ul'yanovsk derive significant meaning

from their employment, both through the continued valorisation of manual over mental labour at the heart of their occupational subcultures, and from their commitment to the role of breadwinner in young families. As such, the men's working lives continue to be underpinned by the type of biographical narrative that theorists of the 'end of work'

(Bauman 1998) argue has all but disappeared. While able to derive a sense of wellbeing both from their work and their family roles, however, the physical stress of overwork, alongside the emotional stress of failing to fulfil family expectations in the context of a wider consumer revolution, are identified as key barriers to men's wellbeing.

## **Fatherhood in a Gendered Welfare State. How Challenging Can a Father-Friendly Work Place Be?**

Isabel Valarino, University of Lausanne | [isabel.valarino@unil.ch](mailto:isabel.valarino@unil.ch)

Barbara Risman's gender as a social structure theoretical framework (1998, 2004, 2011) proposes a multilevel approach of the construction, reproduction and change of gender relations where institutional, interactional and individual levels are interrelated. With this paper, I analyse the way fatherhood representations and practices are shaped by parental leave policies (institutional level) and work place environment (interactional level). Switzerland is the only European country, which does not provide any statutory leave policy for fathers. Within this gendered welfare state, paid paternity leaves and unpaid parental leaves are increasingly implemented in the labour market, particularly in the public sector. I analyse this yet unexplored setting through a case study in a Swiss French-speaking public administration which has implemented a far-ranging work-

family life policy and recently extended its paid paternity leave to one month. Qualitative interpretive analysis is conducted on 30 in-depth interviews with fathers who benefitted from paternity leave and line managers who experienced leave uptake in their team between May 2010 and 2012. Results show that although fatherhood has gained visibility and acceptance in the work place, involved fatherhood and career advancement are considered as incompatible. Informal norms about leave uptake and anticipation of work place demands are observed. Fathering practices observed challenge in a limited way gender relations. These results are contextualized within the Swiss society where the predominant family pattern is a modified male breadwinner model (men full-time and women part-time employment), and where the division of unpaid work is still very gendered.

## **a05RN14 - Gender Pay Gap**

Chair(s): Emma Calvert (Queens University, Belfast)

### **Gender Pay Gap in the Current Turkish Economy**

Banu Kavakli Birdal, Kemerburgaz University Istanbul | [banu.kavakli@kemerburgaz.edu.tr](mailto:banu.kavakli@kemerburgaz.edu.tr)

This paper is based on a survey conducted in 2012 in Istanbul, Turkey with labor force

participants. The data reveal that the wage differential between genders is an evident and

ongoing problem. Evaluated against the backdrop of government policies to “reconcile work and family life”, the current situation gains importance especially in the struggle for gender equality in Turkey. The Justice and Development Party’s call on women to have at least three children to keep the population young and hence maintain economic growth counters the alleged attempts to integrate women into the economy as equal citizens.

Particularly in an economic environment where the government boasts about the growth rate of Turkish economy, this issue enables us to question the “gender appropriate” role of women in the labor market as well as the domestic sphere. Assessing the relative economic welfare of working women in Turkey, this paper aims at understanding the factors underlining the persistence of gender pay differentials.

## Disentangling the Education Effect on Women’s Employment

**Nadia Steiber**, Wirtschafts Universität, Wien | [nadia.steiber@wu.ac.at](mailto:nadia.steiber@wu.ac.at)

**Caroline Berghammer**, University of Vienna | [caroline.berghammer@univie.ac.at](mailto:caroline.berghammer@univie.ac.at)

**Barbara Haas**, Vienna University of Economics | [barbara.haas@wu.ac.at](mailto:barbara.haas@wu.ac.at)

We use international survey data from the United Nation’s Generations and Gender Programme to study education effects on women’s employment. The aim is to disentangle the micro-level mechanisms that underlie observed effects of the woman’s and the man’s education on couple employment arrangement (dual-careers, male breadwinners, etc.). The study examines the variation in the strength of education effects both across countries and across the stages of the family life-cycle. It presents a structured theoretical account of how macro-level conditions such as education-based inequality in terms of the quality of jobs, gender attitudes, and labour market constraints, may mediate the strength of micro-level education effects. Findings: In contrast to what tends to be suggested in the literature, i.e. that education effects on women’s employment are smallest

in Scandinavia and other woman-friendly welfare states (e.g. Evertsson et al., 2009), our analysis suggests that this is only the case in later stages of the family life-cycle when children have grown older. When children are below age three, France shows the most sizeable education effects on mothers’ employment followed by Norway and Germany, while much smaller effects are found in Austria and Hungary. With the aim of disentangling the mechanisms that underlie observed education effects, we find that attitudes are important for explaining higher educated women’s stronger work involvement, yet they are only part of the explanation. In addition to supply-side rationales, it is important to also consider also demand-side constraints (job opportunities) for explaining the variation of education effects on women’s employment.

## Gender Empowerment, Female Supervisors, and the Gender Wage Gap

**David J. Maume**, University of Cincinnati | [maumedj@ucmail.uc.edu](mailto:maumedj@ucmail.uc.edu)

**Leah Ruppanner**, University of Nebraska | [lruppanner2@unl.edu](mailto:lruppanner2@unl.edu)

Scholars have noted the rapid increase in women’s representation in the ranks of management, and the reduction of wage

inequality in larger and more active welfare states. In this study we combine these literatures to examine the magnitude of the

gender wage gap by examining sex-of-supervisor effects on subordinates' pay, and to what degree the state's commitment to equality conditions this relationship. We hypothesize that more liberal states will create more female supervisors as it seeks to reduce labor market inequality, and as it takes responsibility for care work previously performed by families (or what Esping-Andersen calls, "defamilialization"). If liberal welfare states are associated with more powerful female supervisors, then the pay effect of directly reporting to a female supervisor should be positive, especially for women. But, if defamilization creates more symbolic and marginalized female bosses, then the pay effect of reporting to a female

supervisor should be negative for men and women alike. To adjudicate between these competing propositions, we use data from the 2004 and 2010 European Social Surveys to estimate hierarchical wage attainment models that include relevant predictors of pay at the individual level, and in the nation of residence (i.e., measures of women's political and economic empowerment and the size of the welfare state). We anticipate that the probability of reporting to a female supervisor will be higher in more gender-empowered nations, but and will empirically assess whether this means that the gender wage gap is lower in these nations and when subordinates report to a female supervisor.

## 06RN14 - Work/Life Balance 1

Chair(s): Áine Ní Léime (Irish Centre for Social Gerontology - National University of Ireland Galway)

### Motherhood and Fatherhood. The Role of Institutional Context in Italy

Sonia Bertolini, University of Torino | [sonia.bertolini@unito.it](mailto:sonia.bertolini@unito.it)

Rosy Musumeci, Univeristy of Torino | [rosy.musumeci@unito.it](mailto:rosy.musumeci@unito.it)

Manuela Naldini, University of Torino | [manuela.naldini@unito.it](mailto:manuela.naldini@unito.it)

Torrioni Paola Maria, University of Torino | [paola.torrioni@unito.it](mailto:paola.torrioni@unito.it)

This paper examines the impact of welfare and labor market policies and of other institutional and cultural relevant factors on gender relations and motherhood and fatherhood constructions of Italian expectant parents. The study is divided into two parts. The first one illustrates the Italian institutional context which serves as reference point for understanding parents' beliefs and attitudes which guide their decision processes regarding the gender division of labour between care and employment. The second part of the paper stems from a qualitative study, part of an international comparative project, that using a life course approach reconstruct the first

transition to parenthood of 22 Italian working couples, living in Northern Italy. The findings of the study suggest that changing lives of "young generation" of dual-earner couples in Italy in terms of balancing work and care are colliding with the "incomplete" revolution (Esping-Andersen, 2009) of Italian welfare state, in terms of family policy, equal opportunities and labour market policies. The "traditional" vision of gender roles widespread in the workplaces contribute to the persistence of a gendered pattern of work in the family and in the labour market. Our expectant parents' plans about how to balance paid work and family life after childbirth involve that mother will take

parental leave while the father will not, and that the mother will be the main provider of childcare. One argument used frequently to motivate their decision and plans for not taking up parental leave was the widespread gender

culture in the workplace. A second argument was that the presence of mother is the best for the child. The "Family care model", is a better solution for the baby.

## When the Third Person Comes in. Outsourcing of Domestic Labour in Spain

**Teresa Jurado-Guerrero**, UNED, Madrid | [tjurado@poli.uned.es](mailto:tjurado@poli.uned.es)

**Maria Jose Gonzales**, Universitat Pompeu Fabra, Barcelona | [mjose.gonzalez@upf.edu](mailto:mjose.gonzalez@upf.edu)

**Marta Domínguez**, Sciences Po | [marta.dominguezfolgueras@sciences-po.org](mailto:marta.dominguezfolgueras@sciences-po.org)

**Francesca Luppi**, UPF | [francesca.luppi@upf.edu](mailto:francesca.luppi@upf.edu)

Women's increased participation in the labour market has had many consequences for the work-life balance. Working women in general, and working women with small children in particular, have less time for caring and for domestic tasks, while upholding higher expectations for gender equality and hoping to spend more time with their children. The feeling of 'time squeeze' among dual-earner couples has pushed more men to increase their participation in domestic tasks (due to lower time availability of the partner), has forced more women to reduce time devoted to domestic work and has, finally, driven more couples to outsource many routine and tedious tasks. In Spain, employees in domestic service have increased from 350,000 in 2000 to 600,000 in 2008, which is related to an unprecedented and general increase of immigrant labour force in this decade. In the paper we argue that

Spain is country where outsourcing has diffused across many social groups in a relative short time period, at least until the outbreak of the economic crisis. Thus, outsourcing was a rather selective phenomenon in the 80s and became more generalised by the mid-90s coinciding with the arrival of large numbers of non-EU female migrants into the labour market. Outsourcing also became particularly common among dual-earners with small children due to the 'unfriendly family policies' characterising the Spanish context. This paper first describes outsourcing trends in Spain from the mid-80s to 2010, and secondly analyses differences by income groups, in particular by women's income, and household types in the propensity to outsource domestic labour. The study is mainly based on microdata from the Spanish Family Budget Survey (FBS).

## Lone Mothers in European Cities: Strategies of Work and Care Reconciliation

**Ilona Matysiak**, University of Warsaw | [ilona.matysiak@uw.edu.pl](mailto:ilona.matysiak@uw.edu.pl)

**Renata Siemieńska**, University of Warsaw | [siemiens@post.pl](mailto:siemiens@post.pl)

The number of divorced and separated women with children among married and cohabitating ones has increased significantly in most European countries. Today, single mothers face major challenges produced by contemporary European welfare states, including popular welfare legitimacy and

recent cutbacks in public spending on welfare services due to the economic crisis. Apart from that, growing population diversity, new gender roles and changing family models are the other important factors shaping social expectations and behavior in terms of work and care reconciliation. These challenges are difficult to

deal with especially for less educated individuals, whose performance on the labor market is often marked with precariousness and the danger of social exclusion. In such circumstances, poorly educated single mothers need to develop strategies of work and care reconciliation using the resources, which are available for them: welfare services provided by public, private and third sector as well as support within the private safety net. We claim, that the single mothers' strategies of work and care highly depend not only on the cultural values and type of welfare regime in a

given society, but also the mothers' subjective perception of the providers of welfare services. The paper is based on 120 in-depth interviews with poorly educated lone mothers conducted in 20 large and medium cities of 10 European countries: Germany, Switzerland, France, The Netherlands, Sweden, Great Britain, Spain, Italy, Poland and Croatia. The data collected in medium size towns and large cities give the opportunity to examine the lone mothers' strategies in different types of local communities existing in the frame of various welfare regimes.

## 07RN14 - Work-Life Balance 2

Chair(s): Clary Krekula (University of Karlstad)

### Organising Family and Work Life in Families with Under-School Age Children: ISSP Data for Lithuania

Audrone Telesiene, Kaunas University of Technology | [audrone.telesiene@ktu.lt](mailto:audrone.telesiene@ktu.lt)

Lithuania is among those high human development countries with best gender equality indices (see Human Development Report, 2012). Still country faces specific issues related to reconciliation of work and family roles. Female employment level in Lithuania is above the EU average. But labour market lacks opportunities to use flexible forms of employment. Provision of childcare services in Lithuania is insufficient. Lithuanian gender regime has also a characteristic of traditional attribution of domestic responsibilities to women. These contextual factors shape double/triple pressure on women – childcare responsibilities, household duties and employee duties. The aim of this paper is to present the quantitative descriptive analysis of survey data and to answer

questions: 1) What is the share of women (in Lithuanian population) who both have higher income (than their partner) and spend more time looking after family members and doing household work? 2) What are the public attitudes towards who (father/mother) and to what extent should take parental leave? 3) What are the public attitudes towards organising family and work life in a family with a child under school age? 4) How does the specific modes of organization of family and work life affect women's feeling of happiness, satisfaction with family life, satisfaction with job, and subjective evaluation of one's health. The paper employs Lithuanian data from International Social Survey Programme (ISSP) 2012 module "Family, Work and gender roles".

## Families Living the 24/7 - Economy: Experiences on Work-Family Interface in the Netherlands, the United Kingdom and Finland

Mia M Tammelin, University of Jyväskylä | [mia.tammelin@jyu.fi](mailto:mia.tammelin@jyu.fi)

Anna Rönkä, JAMK University of Jyväskylä | [anna.ronka@jamk.fi](mailto:anna.ronka@jamk.fi)

Kaisa Malinen, JAMK University of Jyväskylä | [kaisa.malinen@jamk.fi](mailto:kaisa.malinen@jamk.fi)

Many employed families in Europe live the 24/7 -economy. Still, relatively little is known about the way working mothers and fathers experience these so-called non-standard working hours. The main research question of this paper is to investigate the experiences on work-family interface among mothers and fathers who work either traditional day-work or non-traditional working time in the Netherlands, the United Kingdom and Finland. The study uses a recently gathered survey data (N = 1300). All respondents have children aged 0 to 12 years old. Countries in question have substantial differences in their social policy and services, employment systems, family policy and practices. For example, working time practices vary: Finland has a tradition of full-time working parents, also among mothers, while the Netherlands and the UK are

best characterized with part-time work among women. Also the provision and organization of care varies; Finland is amongst the few countries which has day-and-night care for under school aged children. The paper will look at the importance of various dimensions of working time to the experiences of work-family conflict and facilitation. Work-family interface is a two-dimensional measure including positive spillover and conflict (Carlson et al. 2000; Hanson et al 2006). Besides descriptive analysis, the study will use regression analysis. All analysis will analyze the importance of gender. This paper is part of the Finnish Academy funded research project "Families 24/7 - Children's socio-emotional wellbeing and daily family life in a 24-h economy" (2011- 2014).

## Doing "Working Motherhood" in Dublin

Evelyn Mahon , Trinity College, Dublin | [emahon@tcd.ie](mailto:emahon@tcd.ie)

Work-life balance and care This paper is based on focus groups with employed women in Ireland who have a child under school going age. The focus groups examined the meaning of work for women, their child care arrangements, their spousal supports and their views on work life balance policies in Ireland. The focus groups reveals the way in which mothers "do working motherhood" in Ireland. The strategies of the higher educated women will be compared to those of mothers with lower educational levels , exploring the intersections between gender and class. The paper will explore the impact of income on mothers' childcare arrangements and in particular the extent to which they use informal

or formal childcare or indeed what combinations of childcare they use for different children. All of the women in the focus group are employed either full time or part time. Their choice of childcare services has an impact on the division of childcare and the equity of care division in households. Do Irish fathers' parental care of children enable mothers to achieve a family/work life balance or simply lead to new sites of role contestation and conflict within the family? Organisational culture is also explored as are the challenges mothers face in areas of work that are undergoing structural change under austerity conditions. The paper is drawn for the FLOWSeu FP7 Project . The FLOWS project

examines the impact of local welfare systems on female labour force participation and social

cohesion.

## **Understanding Work-Family Conciliation Processes of Immigrant Working Mothers in Italy: Geographies, Immigration Policies and Labour Market Segregation**

Paola Bonizzoni, University of Milan | [paola.bonizzoni@gmail.com](mailto:paola.bonizzoni@gmail.com)

Research on the work-family balance has often downplayed the experiences of migrant and ethnic minority women: this is also the case in Italy, where migrant women represent, however, a growing share of the workforce, albeit strongly segregated in the low-skilled domestic and care sector. This paper – which draws on 48 qualitative interviews with Latin American (Ecuadorean and Peruvian) and Eastern European (Ukrainian, Moldavian and Rumanian) working mothers with at least one minor child in Italy – argues that migratory policies (stratifying migrants' access to social rights, pushing them to stay employed not to lose their residency status and allowing the reunification of their relatives just under strict economic requirements) and labour market segmentation (positing immigrant women in

labour intensive, badly remunerated, highly informal and unprotected jobs) strongly impact on the way these families can reconcile work and family. As the paper will show, childcare is managed – over time, but also simultaneously – in and across multiple locations, depending on the resources available to families here and there. While long-distance caregiving strategies can be conceived as an additional resource migrant families can draw upon to solve caregiving dilemmas, they can also be interpreted as the outcome of an exclusion experienced locally, that confirms the limited incorporation of migrants in receiving societies, often conceived as “unencumbered workers”, whose care responsibilities are neither given place nor full recognition.

## **08RN14 - Precarity**

Chair(s): Emma Calvert (Queens University, Belfast)

## **Un/Equal In/Security and Gendered Rationalities of Parenthood – Negotiating Care and Career in the Context of Work Precarity**

Johanna Närvi, National Institute for Health and Welfare | [johanna.narvi@thl.fi](mailto:johanna.narvi@thl.fi)

The paper addresses experiences of precarious work and the gender arrangements concerning care and paid work from the perspective of parents of small children in Finland. It draws on qualitative interviews from 29 mothers or fathers who had worked in fixed-term contracts. I understand parents' individual 'choices' as embedded in and

negotiated with specific structural and cultural contexts and in relation to other actors. The Finnish context features two contradictions. First, notwithstanding women's high educational level and employment rate, career instability in the form of fixed-term contracts is common among women in an average child-bearing age. Second, while the welfare state

with its relatively generous family policies promotes the ideal of a dual earner–dual carer family, the practices concerning parenthood and paid work still remain gendered and set different and even conflicting conditions to women's and men's opportunities to act in and to combine the two life spheres. The research questions asked are: What kinds of rationalities are found behind mothers' and fathers' choices and practices concerning care, paid work and the division of labour? What is the role of the gendered career precarity? The

analysis of the interviews focuses on the notion of agency and how it is interpreted within the interviewees lived experiences, and the contextual possibilities/constraints. I argue that the ambivalent preferences and cultural ideals about motherhood, fatherhood and a good employee, and the relative (in)security of the parents' labour market situations intertwine in the parents' gender arrangements. Two rationalities are found: a joint investment to either the more secure or the more insecure career.

## Roma Women Employment Precariousness

Ana Maria D Preoteasa, Research Institute for Quality of Life, Bucharest | [anita@iccv.ro](mailto:anita@iccv.ro)

The Roma research studies conducted in the last 20 years in Romania showed a general pattern regarding Roma women employment: large unemployment and inactivity (more than 70% EuInclusive 2011). Women represent a highly vulnerable category most of them being housewives, with very low education and qualification. They have a traditional role in raising children and taking care of the family. Their chances of labour market integration are very poor and even the employed women are unskilled and have insecure and low quality jobs. The objectives of my presentation are to describe the Roma women situation and to

identify the main factors explaining the employment patterns women in four European countries: Romania, Bulgaria, Spain and Italy. The comparative method will Data used in this research are provided by an international database (EuInclusive 2011) containing comparable samples for the four countries. The survey covers many issues: activity, employment, unemployment, discrimination, social inclusion, migration. For the analysis I used the logistic regression models in order to identify the main explanatory variables for the model.

## Precarious Love. Women, Academia, and Transnational Relationships

Alberta Giorgi, Centro de Estudos Sociais | [alberta.giorgi@gmail.com](mailto:alberta.giorgi@gmail.com)

Alice Mattoni, European University Institute | [alice.mattoni@eui.eu](mailto:alice.mattoni@eui.eu)

In the past years, precarity became an acknowledged analytical category: studies flourished that analyze its dimensions and consequences in various fields. While some authors consider precarity as exclusively related to the working conditions of individuals, a growing body of literature suggests that the boundaries of precarity are porous since it refers to a social condition that affects the private and public sphere of individuals, their

working and their leisure time. Amongst other categories, early stage academics are especially affected by precarity. The academic profession has been always characterized by a relatively high mobility of scholars, but today young academics deals with a highly competitive market, deeply affected by the constant decrease in public funding for universities. Moreover, the global transformations of the university system push

towards the adoption of temporary workers that render the academic labour even more flexible than in the past. Early stage academics, therefore, frequently move from their country of origin. Many of them are young women who leave families and relationships behind them. This paper is based on an ongoing research project that explores the multifarious and innovative arrangements of transnational couples from the viewpoint of

women, including the challenges related to organize loving and caring relationships. The paper presents some preliminary findings based on the analysis of in-depth interviews with young women at the early stages of their academic careers, focusing on how precarious working conditions paired with transnational migration intertwine with the daily lives of transnational couples.

## **The Relationship between Precarious Employment Situations and Subjective Health**

**Silke Tophoven**, Institute for Employment Research, Nuremberg | [silke.tophoven@iab.de](mailto:silke.tophoven@iab.de)

**Anita Tisch**, Institute for Employment Research, Nuremberg | [anita.tisch@iab.de](mailto:anita.tisch@iab.de)

Addressing the increase of precarious employment and its consequences has become an important issue of current labour market research. Changing labour market structures also lead to changing work-related health problems. There is a trend towards more psychologically demanding jobs away from physically demanding jobs. For Germany, a comprehensive empirical consideration of the relationship between precarious employment situations as a multidimensional concept and health is missing so far. Against this background we aim to answer the question how different dimensions of precarious employment situations are related to subjective mental and physical health. Special attention is paid to gender differences as we expect differences in the occurrence of precarious employment situations for women and men as well as gender-specific strains resulting from precarious employment

situations. Thus, the relationship is considered separately for women and men. In order to detect precarious factors, we use seven dimensions comprising objective criteria as well as the subjective processing of the employment situation. We use data from the German IliD study which contains information on the current employment situation and subjective health. The study consists of a sample of 6,585 middle-aged employees with an equal distribution of women and men. We use OLS regression models to test our assumptions. To sum up the results, women are more often affected by precarious employment situations than men. The multivariate results show differences in the relationship between the dimensions of precarious employment situations and physical as well as mental health among women and men.

### Do Unions Promote Gender Equality? Women and Men in Israel's Collective Agreements

Lilach Lurie, Bar-Ilan University Law Faculty, Postdoctoral Researcher | [lilach.lurie@biu.ac.il](mailto:lilach.lurie@biu.ac.il)

This empirical study of most of Israel's sectorial collective agreements shows that collective agreements promote a patriarchal division of labour. Many collective agreements provide mothers with flexible working hours and reimbursements for day care centers. Working fathers are generally not entitled to these rights; their role is to financially support the family. Therefore working fathers - and not working mothers - are entitled to a special "family supplement" that is added monthly to their wage. The research examines provisions providing working parents a right to reduced working hours; a right to day care subsidy, and a right to a family supplement. The research includes most Israeli sectorial collective agreements; 38 extension orders of the Israeli Minister of Industry, Trade and Labour; Israel's

civil service regulation, which is integrated in the public sector collective agreements; and, finally, all collective agreements applicable to Teva Pharmaceutical Industries and El-Al Airlines. The research also includes case law and legislation that intervene in the content of the agreements and promote gender equality. The evidence of this research suggests that unions in Israel do not promote gender equality as much as legislative and case-law policies. Collective agreements in the private sector promote gender equality even less than collective agreements in the public sector. This article gives empirical credence to previous theoretical researches that questioned the role of unions in promoting weakened workers' interests, and in this case promoting gender equality.

### A Female Problem in Welfare Policy? Gender Mainstreaming in Neoliberal Times

Angelika S Landén, Mid Sweden University | [angelika.sjostedt.landén@miun.se](mailto:angelika.sjostedt.landén@miun.se)

Gunilla UE Olofsdotter, Mid Sweden University | [gunilla.olofsdotter@miun.se](mailto:gunilla.olofsdotter@miun.se)

This paper researches gender mainstreaming practices and its intertwinements with growing emphasis on neoliberal forms of governance. It is a pressing research area since it has shown that increased emphasis on work continuously neglect intersections of gender and other social inequalities in the labour market. We untangle how gender mainstreaming practices in an EU funded project in Sweden became intertwined with current workfarist reforms in the public health insurance policy. The increase of long periods of sick leave in Sweden has been constructed as an acute problem for public economy, labor market and

for individuals on sick leave. It has become a 'gendered' issue in debate and policy where men and women's sick leave rates follow different patterns. In the current context, women have become viewed as particularly problematic. Women in the public sector answer to the largest increase in reporting in sick since the late 1990s and their sick-leave periods are longer than for men. We followed an EU funded project set up to construct a new model for occupational health service for reducing sick leave rates among employees in a Swedish municipality. We took part in activities, conducted interviews with

participants and analyzed project documents. Our results coincide with current research that points to that EU gender mainstreaming does not challenge market forces and power relations underlying structural inequalities.

How could we critically comprehend this formulation of a 'female problem' of workfarist regimes framed by enhanced focus on gender mainstreaming forged in EU legislation and policy?

## **Are Inequalities Created and Preserved on the Local Level? Insights into Local Policy Making Processes**

Kairi Kasearu, University of Tartu | [kairi.kasearu@ut.ee](mailto:kairi.kasearu@ut.ee)

Dagmar Kutsar, University of Tartu | [dagmar.kutsar@ut.ee](mailto:dagmar.kutsar@ut.ee)

Avo Trumm, University of Tartu | [avo.trumm@ut.ee](mailto:avo.trumm@ut.ee)

Eurostat statistics show different employment rates for women with and those without children across European countries; the rates being lower for women with under-age children, and especially in the group of mothers with children below two years old. The research evidences of the policy-driven research project FLOWS funded from the EU 7FP for the years 2011-2014 on which the current presentation will base, indicate that women are not enough supported by political means to ease their load in family informal care work and free them for further training and career horizons. Is the return or entry to the labor market of women with child care responsibilities a policy issue on the local

level? What are the challenges the policy actors face? How broad is their "play-ground" and how long are their "hands"? The presentation will make insights into local policy formation and will demonstrate its autonomy or dependence on both national and international directives and the role of mindsets (preferences, interests, world views and cultural orientation) of the policy actors by conceptualizing the perspectives of training and employment opportunities of women with informal care load. The presentation will draw data from 112 qualitative interviews carried out with local policy actors in eleven European cities in 2011.

## **Gendering Public Sector Labour Conflict**

Magnus Granberg, Mid Sweden University | [magnus.granberg@miun.se](mailto:magnus.granberg@miun.se)

Expansion of the service sectors during the last half century has significantly altered the face of industrial strife in many countries, including Sweden. The 'tertiarization' of strife has caused its 'feminization'. This is especially clear in Sweden with its strongly gender segregated labour market, but to some extent reflects a more general development. While the crisis provokes various forms of worker response across Europe, according to this paper a salient factor is the rising tide of public sector labour strife, epitomized in the proliferation of general or sectoral strikes, and

in some national contexts this has two consequences contrasting the present resurgence from the one in the 70s: not only is resistance concentrated to predominantly female groups of workers but it is also to a large extent carried out by professional workers. Against this background, I use data from a study of recent labour conflicts among nurses in Sweden to make comparisons with developments in other European countries. Analysis indicates the importance of labour market institutions in shaping national trajectories of labour strife while pointing to a

perhaps neglected way that the economic crisis is reshaping gender relations.

## 09RN14 - Work/Life Balance 3

Chair(s): Clary Krekula (University of Karlstad)

### Work-Life Balance and Gender Inequality in Mediterranean Welfare Countries

Tania Toffanin, University of Padova | [tania.toffanin@unipd.it](mailto:tania.toffanin@unipd.it)

The decline of Fordism has deeply weakened the Keynesian compromise that for the most part of last century has strongly contributed to the social construction of male-breadwinner model and to enforce the uneven division of care work between genders. After 1970s, feminist movements' struggles against the unbalanced representation in political frameworks and disparities in workplaces seemed to elude the enduring inequalities within the couples, in the household. Along these lines, the emancipator effect of dual earner family has obscured the material condition of work and life of women compared to men, representing the formal equality of opportunities to access in labour market to the substantial attainment of a level playing field in society as well. The effect has been an enduring gender inequality both in public and in private sphere. This phenomenon is more

noticeable in Mediterranean countries because of the peculiar relationship between the production and the work of social reproduction. In these countries is urging, not only the increase in the participation of women in labor market, but the spread of equal treatment in working and living conditions of women and men. However, the analysis of labour market flexibility in a comparative perspective between Italy, Spain, Portugal and Greece reveals that the labour market structure, unlike in other European countries, is not the result of autonomous choices made by men and women employees, but it represents the result of the gender division of labour in the household. Hence, it shows the continuity of patriarchal structures that determines on the one hand the access of in the labour market and on the other hand the career paths of both genders.

### Work-Life Balance: Why Choose between the Two? A European Cross-National Analysis from a Life-Course Perspective.

Chrystalla Vassou, London School of Economics and Political Science | [cv262@cantab.net](mailto:cv262@cantab.net)

Work-life balance (henceforth 'WLB') is often presented as a dilemma or choice for women. Yet, in most European countries, patterns are observed such as the load of childcare falling on women, urging a distinction between genuine choice and the political rhetoric of choice. Using data from different welfare state regimes, this paper provides a European cross-national comparative analysis of the

extent to which national regulatory frameworks shape the design of households' patterns of labour market integration over the life course. Arguably, WLB is a dynamic process, subject to change over time. Thus if we are to understand what it means to achieve and maintain a satisfactory WLB, then historical progress, changes in the nature of paid and unpaid (care) work, the diversity of

modern (family) life patterns, and the institutional context need to be taken into account. Therefore, the paper adopts a life course perspective, which allows for a holistic approach in exploring these factors and demonstrates the changeability of WLB. Women's attitudes (and related behaviour) to employment and family responsibilities are shown to vary according to both context and stage in the family life cycle. Work-life biographies are constructed in terms of their

available opportunities and constraints. In accounting for social change, this perspective recognises people as active agents can to an extent reverse their family trajectories. Empirical evidence from modern western societies suggest that there is nothing deterministic about work and family change, rather work-life patterns vary greatly between and across the individual life course and within and across different countries.

## Work-Life Balance - Social Exclusion and Inequality: The Case of Poland

**Dorota DM Mroczkowska**, Adam Mickiewicz University, Poznan | [drmrocz@amu.edu.pl](mailto:drmrocz@amu.edu.pl)

**Honorata Jakubowska**, Adam Mickiewicz University, Poznań | [honorata@amu.edu.pl](mailto:honorata@amu.edu.pl)

The analysis of contexts in which the notion of the WLB becomes present in Poland shows that the understanding of this idea is based on rather conservative, modern perception of social reality, on the opposition or dichotomy of the private and public, work and life, work and family. Such look narrows the perspective only to the groups which fit in the dimensions of the work - life - family, for example, to people with a family and children. A broader perspective, which we want to take, is going to include a number of important characteristics and properties which have not been taken into account or have been consciously excluded from the dominant discourse of the WLB. Specifically, we want to include border (grey) areas and groups that do not fit into the

dichotomy of work-life (family). The main questions that we want to ask will include: How is WLB defined? What are the factors necessary to achieve a balance between work life and work? Can WLB be seen as a dimension of social differentiation and social inequality? What are the excluding functions of WLB? How temporal dimension of WLB is created? What a time perspectives of balance between work and life are taken? In the second part of our presentation we want to concentrate on the gender issues and ask to what extent the practices proposed by WLB reconstruct traditional oppositions connected with gender, such as private vs. public, male vs. women ("male" jobs vs. "feminine" life)?

## The Development of Work/Family Reconciliation Policy in Italy

**Egidio Riva**, Università Cattolica di Milano | [egidio.riva@unicatt.it](mailto:egidio.riva@unicatt.it)

In Italy, since the late 1990s, some relevant changes have been taking place in the field of work/family reconciliation policies. On the whole, two distinct approaches can be identified. On the one hand, the 1996-2001 and 2006-2008 centre-left coalition governments defined an extensive policy framework. Its rationale reflects traditional left-wing parties

guidelines and priorities, such as the importance assigned to childcare and early education, the promotion of gender equality, the desirability of state intervention as a guarantee for basic social rights to be enforced. On the other hand, the 2001-2006 and, above all, the 2008-2011 conservative administrations addressed work/family issues

as part of a process of labour market reform and welfare state restructuring based upon the principles of liberalism and subsidiarity. Accordingly, work/family reconciliation policies increasingly became employment-led in the context of a much tighter work/welfare relationship. Besides, in times of welfare state retrenchment, this policy area was meant to be primarily arranged either in the family or

between employees and employers, ahead of any major public commitment. This paper examines such approaches to work/family reconciliation policies. It spells out the ideas and goals which have informed them and explores their difference in terms of policy instruments and settings. The implications of each approach are also discussed.

### **Socio-Economic and Cultural Dimensions of Women Entrepreneurship in Rural Areas: Turkey Research**

**Bulent Gulcubuk**, Ankara University Faculty of Agriculture | [bgulcubuk@gmail.com](mailto:bgulcubuk@gmail.com)

Problems of rural women have started to more attention in the world. Women who are living in rural areas faced with the challenges of life at most one of the groups. Lack of ownership, social insecurity, poverty, for reasons such as the difficulty of the working conditions of women living in the countryside has become a global problem. Women in rural areas are often the most affected by poverty and unemployment. Many women entrepreneurs in rural areas because of the much negativeness inflicted and economic life can't be entrepreneur may not attend. Women are more working than men in rural areas. However, the status of rural women cannot be get rid of unpaid family workers. For this

reason, realization of entrepreneurial activity in generating income for women and facilitating access to credit resources, also contribute to the socio-economic development point of view of rural areas. Therefore, all developing countries will be able to work more comfortably working women in difficult circumstances; status will work to produce high activities in entrepreneurship. In this paper, women's entrepreneurship, the effective factors, the status of women in rural areas, covering the whole of Turkey and "women's entrepreneurship in rural areas" discussed the results of the research will be discussed.

### **The Position of the Female Subject in the Political Space. An Analytical Biography Access to the Study of East German Elected Women's Career-Opportunities**

**Cornelia Hippmann**, University of Dortmund | [cornelia.hippmann@tu-dortmund.de](mailto:cornelia.hippmann@tu-dortmund.de)

This abstract is based of my dissertation project East German women in politics. A qualitative analysis, which I researched under the supervision of Prof. Dr. Fritz Schütze at the

Institute of Sociology at the Otto-von-Guericke University of Magdeburg. The abstract makes a contribution to the study of opportunities and difficulties of East German mandate holders,

and justifies the use of an analytical biography access. I want to demonstrate that the political and socio-cultural change within the former GDR in 1989/1990 offered unique arranging and participation opportunities for politically ambitious Eastern German women to pursue a career as a parliamentarian after setting up a new political scene. The study confirmed that also "gender" has a crucial influence on the political careers of East German women, especially in cooperation with other categories, such as "generations" or "education". In addition, I would like to demonstrate, how gender and gender differences are constructed in the biography of women in politics and derive consequences of

their social memories. ", I have chosen the autobiographical-narrative interview (Schütze 1983) as the main method of my research. In order to reconstruct the processes of social and individual senses of East German women politicians it focuses on the paradoxes that the contemporary mandate holders tend to be confronted with, not at least because of following their linear role within their political action. On the basis of my research project, this paper wants to contribute conceptually analyzing and discussing the situation of East German-socialized women in the political arena and outlining the particular field of research.

## **The E-Inclusion and Improvement of Live's Conditions of Working-Class Women: an Analytical Framework to Study the Spanish Context**

Lidia Arroyo Prieto, Open University of Catalonia | [larroyop@uoc.edu](mailto:larroyop@uoc.edu)

Ana M. González Ramos, Open University of Catalonia | [agonzalezram@uoc.edu](mailto:agonzalezram@uoc.edu)

The digital inclusion is one of the mainstream strategies of the European Union to both overcome social inequalities and achieve an economically and socially sustainable growth, as one can see in A Digital Agenda for Europe from Europe 2020 Strategy (European Commission, 2010). Women with both low incomes and a low level of education are identified as one of the social groups most affected by the digital gap (Huyer and Mitter, 2003; Galazc and Smahel, 2006; Castaño, 2008, 2011). In developing countries, wide empirical evidence shows how the digital inclusion contributes to an improvement of gender equality (Bonder, 2002; Ramilo, 2002; Chen, 2004; Gurumurthy, 2004; Hafkin and Huyer, 2006; Best and Maier, 2007; Friedman, 2008). However, in developed countries, there are few

data about the relationship between e-inclusion and the women's empowerment (Stavrisitu and Sundar, 2012). This paper aims to examine the theoretical approaches about changes in women's lives related to their e-inclusion (Wajcman, 2007, 2009). The purpose of the paper is to offer an analytical framework to study to what extent e-inclusion entails an improvement in conditions of life of working-class women. The term working-class will be used in order to refer people with low incomes, as well as, a low cultural, social and symbolic capital (Bourdieu, 2001, 2006). We focused the proposal on Spain as a developed European country which is one of the countries with more social inequality of European Union (Eurostat, 2012).

## RN15 - Global, transnational and cosmopolitan sociology

### 01RN15 - The Local and the Global: the Multi-Level Constitution of Societies in the 21st Century (I)

Chair(s): Daniel Chernilo (Loughborough University)

#### Multiplicities of Citizenship in the 21st Century

Margit Fauser, Bielefeld University | [margit.fauser@uni-bielefeld.de](mailto:margit.fauser@uni-bielefeld.de)

People's political and social citizenship is still predominantly conceptualized as state membership and tied to national identification. Yet, various global dynamics have led the debate on contemporary citizenship to discuss several new forms and concepts, among which urban as well as transnational (and translocal) versions stand central. Importantly, from both angles scholars emphasize that in spite of the global movements of people, as well as that of money, goods, information and ideas, people's life remains anchored locally and that place may even have gained in importance, in relation to identification, but also in terms of (the exercise of) rights and practices. Considering cross-border migration and the

related transnational ties and practices that often emerge from it the notion of place may have to be substituted by the plural 'places' and the translocal connections in-between. Therefore, when considering citizenship a set of status, rights, practices and sense of collective membership multiple sites and scales need to be taken into account. The question thus arises: how do people, and especially migrants, negotiate their way through the various scales and sites of citizenship? The contribution aims to theoretically introduce this discussion and provides some insights based on the example of ongoing empirical research among new and old migrant groups in German cities.

#### "They Came – They Left: Mobility of a Transnational Factory in a Peripheral Rural Community in Post-Communist Romania.

Milosz Miszczynski, Jagiellonian University, Cracow | [mmiszczynski@ucsd.edu](mailto:mmiszczynski@ucsd.edu)

Global economic development has pushed economic production to underdeveloped regions of the world. Low-income post-Communist countries have become an important market of production for Western economies. Much of the existing literature on global production focuses on the migrations of labor force. By shifting the focus to the issue of the structural consequences of investments' mobility, I hope to complement those analyses and show how hosting communities receive

and cope with the change caused by global production. Drawing on 14 months of ethnographic research in a Romanian village, I examine everyday strategies developed to cope with the localization and displacement of a transnational factory. The displacement of a factory in Jucu, Romania was announced four years after its opening. Before coming to the village, the factory was moved from Germany. In Jucu, mobility of production is understood in a similar way as labor in the factory: as a

temporary engagement. Although sad and disappointed, villagers ultimately agree with the decision, based on a lost competition with cheaper labor force someplace else. Having had a factory and experiencing international attention, they consider the village to be a part of a global production chain and hope for a new investor and more social benefits from the

state. The paper shows their understanding of mobility of production. In my findings, I outline social mechanisms that help the community to maintain economic stability and deal with the social change, as well as understand progressing modernity and urbanization of the low-income peripheries.

## **The Politics of Roma Rights in Europe: A Cross-National Multilevel Assessment of the Empowerment Potential for Local Actors**

Chloë Delcour, Ghent University | [chloe.delcour@ugent.be](mailto:chloe.delcour@ugent.be)

Lesley Hustinx, Ghent University | [lesley.hustinx@ugent.be](mailto:lesley.hustinx@ugent.be)

As disturbingly demonstrated by the many violations of Roma rights across multiple European countries, this paper argues that the ambition of the human rights regime to protect and empower minorities has not been fulfilled. The emphasis on empowerment of local actors in the human rights discourse seems problematic in practice. Although the human rights project envisions empowering minorities in order to build an inclusive society, implicit and explicit exclusive forces are persistently present. Moreover, the participation of local actors is not straightforwardly enhancing human rights, and also on the national level a lot of resistance to inclusion of minorities remains. To gain a more in-depth understanding of the exact mechanisms at stake, we will conduct a comparative analysis of the impact of human and minority rights on the Roma communities in West-, Central-, and

East-European countries by assessing 1) the extent to which different kinds of rights (civic, political, socio-economic, cultural) are respected/violated since 1990 and 2) which actors are involved at which levels, using secondary sources like official reports, news articles, testimonies,... Particularly, the extent to which local actors are allowed, able and willing to be empowered subjects in the implementation process, is examined. In this way, the paper addresses the following research question: 'To what extent do local actors play a transformative role in the politics of implementing Roma rights in Europe?' As the human rights regime today strongly emphasizes this role, it is crucial to assess to what extent there is a local empowerment potential for the Roma communities across Europe.

## 02RN15 - The Local and the Global: The Multi-Level Constitution of Societies in the 21st Century (II)

Chair(s): Peter Holley (University of Helsinki)

### The Social Stratification of Continental Attachment in Africa, Europe and Latin America

Emanuel Deutschmann, Jacobs University Bremen, University of Bremen | [e.deutschmann@jacobs-university.de](mailto:e.deutschmann@jacobs-university.de)

In a world where regional integration is thriving, the question of continental attachment becomes highly salient. In Europe, an ever-growing amount of literature analyses to which extent Europeans identify with their continent and the EU (Inglehart 1970, Eder 1999, Risse 2006, Bruter 2006, Westle 2003, 2012). It has been argued that Europe is a “class project” in which the higher social classes identify with Europe, whereas the lower social strata primarily have local or national identities (Fligstein 2008). This line of research, however, is to date almost exclusively focused on Europe, which makes comparison and relativisation impossible (n=1 problem). As a result, global findings could mistakenly be attributed to the EU and processes of Europeanization. Even the few studies that dare to throw a glance at the world beyond Europe (Jung 2008, Roose 2011) have

remained Eurocentrist in their arguments. We aim at overcoming this n=1 problem by analytically comparing continental attachment in Africa, Europe, and Latin America, the continents on which the world’s three currently existing continental unions (AU, EU, UNASUR) have formed. Analyzing WVS (2005-08) data with multivariate logistic regression, we find that identification with Europe is lower than attachment to Africa and Latin America and that while continental identification is vertically stratified in Europe, social class does not seem to play a role in Africa and Latin America. The findings of Europe as a “class project” and Africa and Latin America as “mass projects” contradict prior research which has argued for universal processes (Jung 2008, Roose 2011), and clearly questions the “lead” of Europe in bottom-up regional integration.

### Towards a Multi-Level Global-Local Sociology. The Case of Spain

Manuel Ahedo, University of the Basque Country | [manuel.ahedo@ehu.es](mailto:manuel.ahedo@ehu.es)

In the increasingly fragmenting, unequal and heterogeneous nation-states sub- and supra-national reality appear as necessary levels of analysis. Global trans-national dynamics are intertwined with local (sub)-national dynamics, and they cannot be understood in isolation from each other. Theoretically, the paper aims to integrate various sociological approaches to look sociologically at the global supra-national and the local sub-national. To analyze the local (sub)-national dimension, classical analyses of

social structures and stratification, elite groups, and ethnic communities and identities are very useful approaches to grasp the differentiating relations of the various locales with supra-national and global dimensions. To account for the global supra-national level a broad range of sociological perspectives are useful, such as figurational process sociology, world-system, world society or polity, multiple modernities, and macro-regionalization. To analyze the two intermingled levels, socially

and geographically dependent educational and labour factors appear as the most determinant. Empirically, the case of Spain, due to its turbulent process of modernization in the age of post-modern late modernity, offers an inspiring case to discuss how the global and the local relate and constitute mutually. In the latest decades Spanish social reality has experienced an intense double process.

Externally, it has seen a strong economic, business and political internationalization. Internally renewed traditional socio-geographic unqualities have marginalized numerous social groups from interacting with global dynamics. It concludes that (sub)national political and economic elites have hegemonized and benefited the globalizing age.

## **The Intersections between the Local and the Transnational Dimensions in the Narrative Construction of the European Identity**

**Gemma Scalise**, University of Florence | [gemma.scalise@unifi.it](mailto:gemma.scalise@unifi.it)

The paper presents some findings from a research project aiming to analyse the role of the intersection between the local and the supranational dimensions in the conceptualization of Europe and the construction of the European identity. It assumes that the meanings attributed to Europe are shaped by the social context and interactions: the European identity is socially constructed in everyday life. The paper adopts a “post-national” theoretical and methodological perspective: the European identity is considered as a “reflexive” social construction “contextualized” in a transnational narrative space (Eder 2009). The empirical part of the paper shows the meanings, definitions and narratives of Europe shared by people in a local context, as they

contribute to the construction of a European identity. The active involvement of the Tuscan region in the European dimension has provided a an interesting sample of “common” European citizens, and thus, their networks of social relations have been analyzed. The findings presented here, based on an analysis of interviews and focus groups with pupils, parents and teachers of four different schools in Tuscany, point out two main results: 1) the narratives of Europe circulating through social relations and shared by people are locally constructed; 2) the openness toward Europe in the local identities is linked to some variables such as education, the socio-economic and cultural background, media exposure as well as transnational networking and experiences in Europe.

## 03RN15 - A Supranational Approach to Europe's Socio-Economic Crisis: Are New Solidarities Possible?

Chair(s): Vincenzo Cicchelli (Gemass Paris Sorbonne/CNRS)

### Europeanized Social Policy in Times of Crisis and the People's Beliefs: Findings from a Comparative Survey

Jürgen Gerhards, Freie Universität, Berlin | [j.gerhards@fu-berlin.de](mailto:j.gerhards@fu-berlin.de)

Holger Lengfeld, University of Hamburg | [holger.lengfeld@wiso.uni-hamburg.de](mailto:holger.lengfeld@wiso.uni-hamburg.de)

Julia Häuberer, University of Hamburg | [julia.haueberer@wiso.uni-hamburg.de](mailto:julia.haueberer@wiso.uni-hamburg.de)

Improving its citizen's welfare has been on the EU's agenda since 1957. In the last three years, EU has answered to fiscal crisis by building up financial transfer mechanisms like ESFS and ESM. In contrast, there still are no European wide harmonized social policies comparable to the national welfare systems. Therefore, we ask if European citizens support the strengthening of EU's competences for carrying out welfare policies, especially building up a uniform EU social welfare system, fighting against unemployment in poorest member countries, and establishing a European-wide minimum wage. Empirically, we present findings from "European Equality Survey (EES)" conducted in 2009. EES measures solidarity attitudes in four European countries: Germany, Poland, Spain, and Turkey as an accession state (N = 4.000). Descriptive

results indicate a widespread acceptance of Europeanized social policy, but with significant country differences. Major support is found in Poland, Turkey and Spain, smallest support is found in Germany. Findings indicate that support of Europeanized social policy seems to be influenced by the extent of national welfare system. In next step, regression analysis is carried out in order to find socio-economic cleavages indicating possible political conflicts on both EU and national level. Results show only slight effects of socio-economic and cultural predictors at the individual level. Again, cleavages seem to occur among countries with different levels of welfare spending, especially between Germany and the other countries surveyed. In sum, results may indicate that Europe's social integration seems to be stronger than often expected in public.

### Fading Democracies, Informal Governance: New Policy Models in Europe

Lukasz Blonski, University of Warsaw | [l.blonski@is.uw.edu.pl](mailto:l.blonski@is.uw.edu.pl)

The purpose of my speech is to present the current trend in global politics, which is related to China's progress in the field of economy and is linked to mentioned country's political system. As a result, a great number of Asian countries (Vietnam, Malaysia) is trying to implement Chinese political system, which is in great contrast with standards of Western democracy. Surprisingly European Union is adopting certain elements of this system as

well (i.e. informal proceedings in European Council or emergent actions of European Central Bank), which may be a consequence of current challenges, not only economic, but also resulting from inefficient institutional power framework within EU structures. I would like to indicate how Chinese political ideas (regarding economy, but also referring to national policy – making), which are often distant or even contradictory with democratic system, are

translated and adjusted to local European contexts. These mechanisms are not only related to authoritarian models of governance, but also to distinctive models of communication and personal relations. During my presentation I would like to indicate how these adoptions may influence the concepts of democracy and governance in Europe (mainly based on examples of European Union) and how they

may influence European countries belonging to EU structures. Even though, the Chinese model of politics will not be directly adopted, as we are talking about countries with totally different institutional history (European countries and China), significant changes are currently occurring, which will influence lives of EU citizens on many levels (political, economic and cultural).

## **Supranational Professionalism - German Civil Society Networks and NGOs Mediating between the European and the Sub-National Level**

Lucia Leopold, University of Bremen | [leopold@bigsss-bremen.de](mailto:leopold@bigsss-bremen.de)

EU regulations and in particular EU funding guidelines increasingly structure scopes of activities at a sub-national level. A growing number of actors are involved in 'EU Affairs' by employing experts, establishing EU departments or even maintaining an office in Brussels. Especially network organization based on new communication technologies seems to be an adequate way to gain influence in EU policy-making and to transfer knowledge. At the same time there is an emergence of trainings, certification and study programs regarding EU Affairs. Although a small number of publications already focused on interest representation in the EU, a sociological investigation of related strategies and European Affairs professionalism is still pending. Which strategies national-based civil society actors pursue to adapt to supranational

structures are as little studied as associated processes of professionalization. Based on data from documental analysis and interviews with experts of several German civil society network organizations and NGOs, this research describes supranational professionalism by focusing on activities like (1) monitoring regulation processes; (2) networking and cooperation; (3) knowledge transfer; (4) sharing of best-practices and (5) interest representation in policy-making circles. The contribution discusses: • the emergence of professional trainings in EU Affairs • network organization and pursued strategies of civil society actors in Germany • major features, tasks, skills, knowledge and patterns of affiliation of EU Affairs professionals in this sector • underlying governance patterns, power of definition and control potentials

## **04RN15 - Democracies, Governance and Politics: Domestication of Policy Models (I)**

Chair(s): Vincenzo Cicchelli (Gemass, Paris Sorbonne/CNRS)

### **Domesticating State Research Institutes**

Valtteri J Vähä-Savo, University of Tampere | [valtteri.vaha-savo@uta.fi](mailto:valtteri.vaha-savo@uta.fi)

My presentation focuses on the domestication of a specific transnational institutional model:

the state research institute. This model started to appear and spread throughout the “western world” during the 19th century becoming more and more diffused during the 20th century. When a new government research institute was established to a specific field in one country, others quickly followed suit. The established institutions took somewhat different organizational forms and names (government or state research institutes, centers, agencies etc.) in different countries. Yet, what was common to all of them and what was novel in their emergence, was the introduction of scientifically oriented organizations into the institutional field of administrative bodies of centrally governed states. These institutions were established into various administrative sectors and were tied to

several sectors of economy and scientific disciplines from forestry to geodesy and from agriculture to geology. In my presentation I will look at how this institutional model was domesticated into Finland and who were the actors advocating it. By analyzing official documents, committee reports and parliamentary records, I have studied how these institutions were first presented as necessary components of rational and effective government of, not only the state, but also of economic activity. My presentation also looks at how these - at first controversial - institutions gradually became naturalized as standard solutions for dealing with governmental problems and dilemmas of decision making in almost every sector of state government.

## The Institutionalization of Gender Equality in OECD Countries

Thomas Laux, Heidelberg University | [thomas.laux@soziologie.uni-heidelberg.de](mailto:thomas.laux@soziologie.uni-heidelberg.de)

Gender equality is one central topic for governments nowadays. Policy models and laws to institutionalize gender equality in countries were and are formed mainly on a transnational level. This can be best captured by looking at international treaties: The UN Human Rights Charta (1948) and the International Covenant on Civil and Political Rights (1966) institutionalized equal rights for women and men. In 1981 the Convention on the Elimination of all Forms of Discrimination against Women introduced and legitimized affirmative action. Gender mainstreaming was then institutionalized on a global scale through the Beijing declaration at the fourth World Conference on Women (1995). The institutionalization of the three policies - equal treatment for women and men, affirmative action and gender mainstreaming – in national

law is the subject of my study. Based on the assumptions of the World-Polity Approach (Meyer et al. 1997) and the theory of the Civil Sphere (Alexander 2006) the processes of institutionalization in 28 OECD countries are analyzed. Whereas the world-polity approach focusses on exogenous factors to explain the diffusion and the institutionalization of global policy models, Alexander points out the relevance of endogenous processes. Both perspectives are taken into account. The analysis is carried out by applying a Qualitative Comparative Analysis (QCA) (Ragin 1987, 2000) to illustrate different solutions, depending on the interdependence of exogenous and endogenous factors in the countries. The analysis shows that five different solutions are sufficient to explain the institutionalization of gender equality laws.

## Epistemic Governance: Revisiting Transnational Power and the Synchronization of National Policies – The Case of Counter-Terrorism Legislation

Pertti Alasuutari, University of Tampere | [pertti.alasuutari@uta.fi](mailto:pertti.alasuutari@uta.fi)

Ali Qadir, University of Tampere | [ali.qadir@uta.fi](mailto:ali.qadir@uta.fi)

The aim of this paper is to contribute to conceptions of modern power and global governance. Moving beyond approaches caught up in methodological nationalism, we build on sociological institutionalism to explain synchronization of national state policies. However, most neoinstitutionalist approaches miss the important roles of national actors and, being generally based on narrowly defined conceptions of power, also often ignore efforts to influence the comportment of others across national boundaries by acting upon their hopes or desires. To revise these concepts, we draw on Foucauldian ideas of micrological, agency-constituting power to argue that society must be defined in a global framework and that this world society consisting of national states is managed increasingly through epistemic governance, which works by making actors perceive the world and its current challenges

similarly. The paper discusses elements of this ubiquitous aspect of modern power, emphasizing the largely ignored angle of transnationally informed decision making in domestic contexts. We illustrate this framework with reference to a single case of the synchronization of counter-terrorism legislation in the 21st century in USA, Canada, UK and Finland, for which we analyze justifications used in parliamentary discussions around the introduction of counter-terrorism laws. We show that epistemic governance is a powerful framework to explain synchronization across countries while also accounting for its seemingly natural nationalization in each country. Lastly, we comment on how epistemic governance can help explain more fully decoupling between policies and practices.

## 05RN15 - Democracies, Governance and Politics: Domestication of Policy Models (II)

Chair(s): Ali Qadir (University of Tampere)

### Measuring Performance in International Diffusion: Turkey's Democratization in Quantitative Indexes

Yetkin Baskavak, Istanbul Bilgi University | [baskavak@yahoo.com](mailto:baskavak@yahoo.com)

The international diffusion of policy models is a widespread feature of current international politics, offering international standards. A certain general framework of liberal democracy, based on the principles of rule of law, good governance, and liberal economy, guides this process of diffusion -especially in the case of defective democracies of

developing countries. An accompanying feature is the proliferation of indexes and quantitative scales aimed at measuring the performance of countries in singular areas or in general democratization. They constitute an integral part in the processes of international diffusion, providing both benchmarks by describing the best practices and disciplinary mechanisms by

defining what is legitimate and accepted. This paper aims to analyze the usage of such indexes in the case of Turkey, which has been undergoing a significant process of transformation, including democratization and civilianisation, policy reforms aimed at economic liberalization, as well as contradictory development in censorship and continuing violations of human rights, or increasing religious influence in cultural life and education. The goal is to explore how these changes are reflected in a series of worldwide

known indexes (including those produced by the UNDP, Transparency International, the Freedom House, and the Committee for Protection of Journalists); and how effective the rankings in these indexes are in the public and political discourses and debates within Turkey. Given the disciplinary potential and discursive power of such rankings in defining universally accepted models and practices, this study will also provide a critical investigation of this potential in the case of Turkey.

## Visa-Free Travel in a Global Perspective. The Spread of a European Policy Model?

Lena Laube, University of Bonn | [lena.laube@sfb597.uni-bremen.de](mailto:lena.laube@sfb597.uni-bremen.de)

Globalization is characterized by a significant increase in persons' mobility across state borders. Thus, visa policies have turned out to be important measures to regulate mobility and with it also life chances (Mau et al. 2012). Worldwide, states have introduced visa requirements for foreign citizens. Nevertheless, all states tend to trust certain countries more than others and cooperate with them in the field of international visa policy. To grant citizens of another state visa-free travel means establishing a positive relation. By means of social network analysis (SNA), it becomes possible to examine the structure of the international network of visa policies. Who is allowed to travel to which country without applying for a tourist visa first? Drawing on two datasets ("Global Visa Net") generated from

secondary documents, I am able to compare the structure of bilateral relations on visa exemptions at two points in time (1969, 2010). First of all, I am interested in the changing role of European states with regards to the overall structure of the policy network: The idea of freedom of movement and open markets is traditionally associated with these liberal Western societies. Already in the 1950s visa waiver programs have been common policy measures in Northern and Western Europe. However, the last decades have seen a wide spread of visa waiver agreements in other regions of the world, too. Thus, the proposed paper also analyses how other groups of states adapt to this model in cooperating in the field of international visa policy.

## Nationalism and Cosmopolitanism: Sociological and Philosophical Perspectives

Daniel Chernilo, Loughborough University | [D.Chernilo@lboro.ac.uk](mailto:D.Chernilo@lboro.ac.uk)

This paper explores the relationships between nationalism and cosmopolitanism and argues that, while they clearly point in different directions, from a sociological and a philosophical point of view they need to be understood as fundamentally interrelated. The paper contends that in their modern versions, both nationalism and cosmopolitanism equally

have a particular and a universal moment that need to be considered in their own right. Nationalism's particularism depends on its ability to provide a sense of closure to social and political identities; its plasticity to 'successfully' claim to have become modernity's key identity-marker. Its universalism focuses rather on its upholding of

a principle individual and collective self-determination which, when accepted internally, cannot be normatively denied to other collectivities. For its part, cosmopolitanism's universalism focuses on a general principle of species-being from which no single human being can be excluded; it offers a way of thinking about common concerns and a global

institutional framework within such concerns can be addressed. But cosmopolitan discourses equally have their particular moment, as only individual themselves get to decide what parts of their individual and collective identities they exercise or bring into play at different junctures.

## Diffusion of the Transnational Model of National Bioethics Committee

Jukka Syväterä, University of Tampere | [jukka.syvatera@uta.fi](mailto:jukka.syvatera@uta.fi)

The aim of this paper is to increase understanding about why bioethical policy advice has spread so efficiently and in such a short time throughout the world. In recent decades national bioethics committees (NBCs) have been established in most affluent countries. Previous research has mainly emphasized either the functional role of such bodies in responding to the challenges modern societies confront due to the developments in life sciences or pointed out to their value in legitimating political decisions. Drawing from world polity theory, this paper offers another interpretation on the emergence of political bioethics and diffusion of the model of NBC by

contextualizing these developments to the more general trends within world culture. The empirical analysis is done by trailing the key documents and events that have affected the present forms of discourse on political bioethics and the relating model of NBC. The process of diffusion is divided into three phases through which the model of NBC becomes increasingly globalized: the emergence of the model, its fashion-like spread throughout the developed world, and organization of international field of political bioethics around the model, triggering the second wave of diffusion to the developing countries.

## 06RN15 - Towards a Renewed Cosmopolitan Sociology (I)

Chair(s): Sylvie Octobre (Ministère de la Culture et de la Communication, France)

### The Challenge of Cosmopolitan Sociology: Empirical Research Amongst Transnational Migrants

Peter H Holley, University of Helsinki | [peter.holley@helsinki.fi](mailto:peter.holley@helsinki.fi)

Cosmopolitanism is often regarded as the polar opposite of nationalism. It is seen as a perspective that embraces heterogeneity and shrugs off the exclusionary practices that nationalism and nation-building have entailed. However, where cosmopolitan practices are identified, they are often seen to be the

preserve of global elites and transnational advocacy networks. By drawing examples from my ongoing research on identity constructions amongst transnational migrants both to and from Finland, I explore the cosmopolitan imaginaries of those whose lives are not elite affairs, but are grounded in ordinary, mundane

experiences. I highlight the relationships between the banal nationalist discourses of those studied and the cosmopolitan perspective they (at times) embrace. Whilst maintaining rather than challenging the

'national order of things', the identifications of transnational migrants may operate within, between and beyond the boundaries of ethnic/national communities.

## **"Digital Recognition" of Other Community Members and New Travel Practices**

Michele Altomonte, Università degli Studi di Torino | [michele.altomonte@unito.it](mailto:michele.altomonte@unito.it)

The study investigates the issue of recognition focusing on the trust dynamics of an online community promoting worldwide free hospitality: the couchsurfers. This kind of community shapes spontaneous networks, supporting the sharing of private spaces and the overcoming of the first hesitations related to trust among strangers. I analyse the information that people require to recognise what I call an impression of reliability, that is the feeling of that sense of commonality that enables communication, engendering cooperative actions; in this case, the free exchange of hospitality. The global interconnectedness that these travellers achieve is made of the search for common meanings, shared values and a pragmatic mutual help connected with the expression of a

cosmopolitan attitude. Following this idea, cosmopolitanism is here the centre of a process that allows actions that wouldn't be possible otherwise, becoming a handhold for recognition and a pathway to trust. 5 networks of 11 users, 500 online references and qualitative interviews have been collected in order to answer some relevant questions about trust and the cosmopolitan outlook: participation as a universal form of guarantee; the role of the similarity of tastes on transnational encounters; rationality and chance in travel practices. In addition, the study explores traveller's motivations and requirements for the social networking, considering his performances and narratives as the quest of a set of specific technologies of the self.

## **The Significance of Virtual and Physical Mobility for Cosmopolitan Attitudes. Theoretical Considerations and Some Empirical Findings**

Knut Petzold, University of Siegen | [knut.petzold@uni-siegen.de](mailto:knut.petzold@uni-siegen.de)

The concept of cosmopolitanism is usually brought into relation with mobility. It is often argued that the experience of other cultures leads to an increased cultural openness, so that cosmopolitanism is commonly attributed to a transnational elite. But for some years it is increasingly noted that virtual or imagined mobility plays also a role, because experiences with other cultures can be made by modern media use as well. However, there are very few empirical studies that compare the importance of physical and virtual mobility simultaneously. In the presentation data of an online survey among users of a German internet platform for

the organization of journeys by carpooling will be used. In the data set  $n = 608$  interregional commuters (shuttlers) and  $n = 78$  international commuters (transnationals) can be identified. In addition, a non-commuting control group ( $n = 383$ ) was recruited in a social network. The interviews contained both cosmopolitan attitudes (global orientation and cultural openness) and media consumption patterns (newspaper, TV, internet), so that the data allow a group comparison analysis. The results show some differences in both the media use as well as in the cosmopolitan attitudes. A multiple regression analysis, however,

suggests that not simply physical mobility but above all transnational mobility is important for a global orientation. In contrast, cultural openness correlates primarily with socio-economic characteristics (age, gender) instead of the mobility experience, while internet use

shows a stable relevance for both attitudes. Overall, the study shows that both the cosmopolitan attitudes as well as virtual and physical mobility types are to be considered differently.

## **From Cosmopolitan Experiences towards Global Issues: French People Teaching in Casablanca and London**

Sylvain Beck, Paris 4 - Sorbonne | [sylvain\\_beck@yahoo.fr](mailto:sylvain_beck@yahoo.fr)

This presentation is focused on a multi-level methodology from individual experiences to a global analysis upon French schools abroad. That is provided from my on-going PhD ethnographic fieldwork concerning the French teachers at the urban scope on two sites : Casablanca (Morocco) and London (United-Kingdom). What can we learn from the experiences of French teachers abroad about global issues and cosmopolitanism ? The French schools in these urban contexts are connected with history in two different ways : a post-colonial one, and a competitive one. The teachers are well located in each urban territory by their work in different schools and their involvement in social activities. They are good informers about global issues. Their reflexivity and knowledge of their social position in the global cities articulate the local

and the global. The experiences of those foreign teachers is included in the local social field. That reveals the international competition of the private education. What are the options and possibilities for schooling ? What is the place of French schools within the city ? How is the competition of schools conditioned by the local and socio-historical contexts ? To be cosmopolitan, teachers need to negotiate subjectively and pragmatically their social and symbolic positions in the host countries with the socio-historical and global context and with the place of France in the international relations. Therefore, this multi-sited approach of individual experiences of teachers in two different urban contexts gives a supranational and cosmopolitan perspective of the global issues.

## **07RN15 - Towards a Renewed Cosmopolitan Sociology (II)**

Robert Fine University of Warwick

## **The Structures of Global Hip-Hop Culture: Towards a Conceptual Model**

Milosz Miszczynski, Jagiellonian University, Cracow | [mmiszczynski@ucsd.edu](mailto:mmiszczynski@ucsd.edu)

Hip-Hop culture is one of the most prominent global cultural forms. Originating from the United States, while circulating the world, hip-hop became a universal cultural form with its rules and ethics. Today almost everywhere in

the world there is a local variety of hip-hop, including music, visual arts and dance. No matter where, hip-hop culture is adapted and translated into local contexts, expressing feelings and needs of specific groups. Basing

on ethnographic studies and a literature review, the following paper analyzes global hip-hop by focusing on its structure. By outlining its components outside of a particular cultural context, the following paper aims to present the structural mechanisms allowing the global spread of hip-hop culture. What makes millions of people in the world, regardless of their language, ethnicity and origin claim that hip-hop is their particular voice? Basing on my own research and current literature, I systematize knowledge about hip-hop and propose a mode of understanding it.

By referring to spheres such as economic power, race, gender, language, religion and place of origin, I identify through which mechanisms global hip-hop becomes translated into local categories. I argue that hip-hop's complex and universal structures provide a model that can be applied and understood by a whole variety of groups. The instance of hip-hop can be further used to discuss the presence and development of universal, global cultures in the contemporary world.

## Cosmopolitan Nationalism in Humanitarian Interventions: A Necessary Evil?

Chloë Delcour, Ghent University | [chloe.delcour@ugent.be](mailto:chloe.delcour@ugent.be)

In this article a critical analysis is made of the legal-political discussion concerning the responsibility to protect (R2P)-principle, which was created to resolve the well-known paradox between state sovereignty (non-intervention) and human rights. Transforming a state's right to control into a responsibility to protect should humanize state sovereignty, making states subject to the supranational agreements. However, the inconsistency in dealing with human rights violations and the dominant role of nation states in humanitarian interventions can urge us to question this optimistic endeavor. I argue that the dominance of state sovereignty is inherent in the R2P-principle itself, and suggest that R2P provides a way for nation states to expand their power, by monopolizing the global institution of human rights. This is something we can denounce as cosmopolitan nationalism, which means that

states will pursue humanitarian interventions from national interests, disguised in cosmopolitan intentions. This implies that the bulk of efforts to legally expand the R2P-principle are inefficient, as it can never resolve the paradox. However, I also wonder if this paradox needs to be resolved. Maybe the dominance of nation states in humanitarian interventions is the best we can get, as we need state power to effectively enforce human rights. However, there are important risks, as interventions are not pursued in a consistent manner, and can even sometimes lead to an aggravation instead of an amelioration of the human rights situation. These risks for the human rights ideal are best assessed by the local civil society actors; claimants and activists, as they are confronted with the real impact of human rights.

## Cosmopolitanism as Translation

Esperanza Bielsa, Universitat Autònoma de Barcelona | [Esperanza.Bielsa@uab.cat](mailto:Esperanza.Bielsa@uab.cat)

Whereas globalisation theory was predominantly silent about the role of translation in making possible the flow of information worldwide, assuming instant communicability and transparency, translation

has gained a central importance in recent accounts of cosmopolitanism which emphasise global interdependence, the negotiation of difference and the notion of multiple modernities. Thus, for Ulrich Beck the

cosmopolitan capacity obliges one to practice the art of translating and laying bridges, relativising one's form of life in front of different possibilities, while for Gerard Delanty the cosmopolitan imagination is, above all, a condition of self-problematisation and openness to the world, and cosmopolitan processes take the form of translations between things that are different. In this context, a specification of translation processes provides a way of analysing the form in which interactions between different modernities take place and of specifying a notion of cosmopolitanism as internalisation of the other. This paper approaches translation

as much more than the linguistic transfer of information from one language to another; widely defined as the experience or the test of the foreign, a process which mobilizes our relationship to the other, translation appears as a material, concrete practice through which cosmopolitanism, conceived as openness to the world and to others, can be empirically examined. After having thus identified the central role of translation in a cosmopolitan context the paper will interrogate how it can be used to approach current notions of aesthetic cosmopolitanism with reference to both high and popular culture.

## **The Cultural Side of Globalization: Aesthetic Cosmopolitanism and Imagination among Young People**

Vincenzo Cicchelli, University of Paris Paris Descartes | [vincenzo.cicchelli@msh-paris.fr](mailto:vincenzo.cicchelli@msh-paris.fr)

Sylvie Octobre, Ministère de la Culture et de la Communication | [sylvie.octobre@culture.gouv.fr](mailto:sylvie.octobre@culture.gouv.fr)

According to Appadurai (1996), imagination plays a tremendous role in shaping our relation to the world and its artifacts. Globalization cannot be reduced to a seldom two-faced process, which first would be determined by economics and second an increase of inequalities. Nor can we assume that globalization is supposed to erase cultural diversity. The aim of this paper is not to linger on the cultural features of globalization. This paper focuses on understanding in which way people relate with globalization and what kind of imaginative process they engage in to do so in their everyday life. The emerging cosmopolitan consciousness and practices are

derivative of a globalized world: cultures are not confined to Nation-States, even if comparative works confirm the widely accepted thesis that national contexts still impacts peoples' conditions considerably. This paper deals with the emerging cosmopolitan consciousness and practices that derive from young people's experiences of a globalized world. The paper is based on two different researches on young people, the rationale for such a choice being to understand the impact of emerging transformations on young people - who are often the barometers of societal change from both generational and life cycle perspectives.

## 08RN15 - Global, Transnational and Cosmopolitan Sociology (I)

Chair(s): Pertti Alasuutari (University of Tampere)

### Supermarket Expansion and Local Subsistence Food Production in Turkey

Yildiz Atasoy, Simon Fraser University, Vancouver | [yatasoy@sfu.ca](mailto:yatasoy@sfu.ca)

This paper examines the shifting relations of food provisioning in Turkey as small producers are increasingly integrated into commercialized agri-food supply chains led by supermarkets. Turkey's entry into a customs union with the EU and a WB-imposed policy measure adopted during the 2001 economic crisis have greatly facilitated the process of market intensification in Turkish agriculture. There are two sides to this process: one concerns the historical centrality of small-scale production directed toward local-regional consumers; the other relates to the dominant role played by supermarkets in changing the conditions of subsistence. The restructuring of wholesale markets and the privatization of formerly state-led agricultural cooperatives and producers' unions have been

crucial for the expansion of supermarkets into agri-food relationships. The competitive growth of Islamically oriented small and medium-sized capital groups alongside large retailers is further deepening the commodification process in food relationships. This paper questions whether a different kind of 'value system' perspective can flourish which emphasizes production for local self-sustenance, while many different Muslim groups are so congenial to participation in markets. The paper centres this question in the larger context of the deep structural issues and fundamental ontological crises which affect food-security issues worldwide. Ultimately, the paper underscores the uneven processes at work in the global proliferation of a market model.

### Grobalization: The Case of Heidelberg, Germany

Brigitte U. Neary, University of South Carolina Upstate | [bneary@uscupstate.edu](mailto:bneary@uscupstate.edu)

The current project presents evidence of grobalization based on fall 2012 fieldwork in Heidelberg, Germany, to examine McDonaldization. As "a parallel notion" to Roland Robertson's glocalization theory, George Ritzer advanced the concept of grobalization, "the imperialistic ambitions of nations, corporations, organizations, and the like and their... need, to impose themselves on various geographic areas." Glocalization theory promises that because globalization is embedded in local structures it retains local uniqueness and thus promotes pluralism. Conversely, the grobalization perspective argues that the global is imposed on locales and results in the loss of local identities and increasing homogeneity within and between

areas. Disguised as glocalization, globalization may coopt local structures and culture. Nevertheless, the end result is grobalization. George Ritzer asserts, "McDoanldization is both, a major example of, and a key driving force in grobalization." Considered one of the most beautiful cities in the world, Heidelberg houses the oldest German University, founded in 1386. Max Weber taught there. The city is rich in local culture, yet diverse because of its international attractiveness to students and tourists. One might consider it immune to grobalization; but empirical evidence reveals its overwhelming presence. Evidence includes 1) the effective strategies of McDonald's restaurants; 2) the proliferation of McDonaldization into society, culture, and

geography; 3) the ramifications of McDonaldization, like imposing the restructuring of daily life; and 4) the bifurcated

response to McDonaldization, from embracing it, to organizing against it.

## Changing We-I Balances in Processes of Transnational Integration: Norbert Elias's Contribution to Globalisation Theory

Klaus Mueller, AGH University of Science & Technology, Cracow | [muelacde@zedat.fu-berlin.de](mailto:muelacde@zedat.fu-berlin.de)

Early approaches to globalisation rejected classical sociological theories for being stuck in a state centred view of society and ignoring transborder flows which opened up a post-territorial space, created post-national identities and transworld solidarities (e.g. J.A. Scholte). Two decades later, it is obvious that formal accounts of globalisation in terms of time-space compression, new channels of communication, integrated markets etc. are not especially helpful to understand the recent backlash against transnational integration, which is threatening even the EU. Norbert Elias' neglected theory of an evolving balance of we- and I-identities offers a more differentiated approach to multi-layered processes of social integration (by which Elias characterises human societies). First, emotional ties and symbolic identifications play

a more prominent role than acknowledged in functional theories of interdependence. Second, a plurality of interlocking integration planes gives rise to conflicts between competing reference groups or units ('we-identities'). Third, different types of relationships (personal, professional, political) to different reference units are not necessarily in sync. Fourth, elites play a central role to balance, reconcile or play off different levels of integration against each other. From this perspective, as will be shown, the present crisis of the most promising unit of transnational integration, the EU, results less from intellectual failure than from competing strategies which elites employ to mobilise public sentiments in favour of their respective power bases.

## 09RN15 - Global, Transnational and Cosmopolitan Sociology (II)

Chair(s): Marco Caselli (Università Cattolica di Milano)

### Transnational Sense of Community in Europe: Its Strength, Scope, and Determinants

Katharina Richter, Jacobs University, Bremen | [k.richter@jacobs-university.de](mailto:k.richter@jacobs-university.de)

Jan Delhey, Jacobs University, Bremen | [j.delhey@jacobs-university.de](mailto:j.delhey@jacobs-university.de)

The current economic crisis in Europe has revived the debate about whether Europeans possess or should possess a "sense of community" with other European Union (EU)

countries. Conventionally, sense of community is investigated as a supranational European identity and/or citizens' identification with the EU (e.g. Bruter 2005). A different, heavily

under-research type is the trans-national sense of community, i.e. the emotional attachment to other countries (Deutsch 1972; Beck & Grande 2004). In this presentation we examine, to our knowledge for the first time, the extent to which Europeans feel emotionally attached to other countries, the geographical scope of this attachment, and the factors influencing it. 2010 Eurobarometer data (EB 73.3) provide the following insights: (1) A slight plurality of EU citizens does feel attached to other countries. (2) EU citizens clearly feel more attached to other European countries than to non-European countries (this taste for Europe is very different from supranational

identification, cf. Roose 2010). (3) At the individual level, transnational practices, migration background, and education boost the emotional attachment with other countries, suggesting that life experiences and cognitive mobilization are key. (4) At the country-level, small and modern-affluent societies have a stronger emotional attachment with other countries than large and less well-off societies. In the discussion we contrast these findings with what is known about supranational identification, to carve out to what extent transnational attachment is an independent component of Europeans' sense of community.

## Relation between National and Supranational Identities – In the Context of the Conceptual Continuum of Thick and Thin Cultural Influences

**Matej Makarovič**, School of Advanced Social Studies | [matej.makarovic@fuds.si](mailto:matej.makarovic@fuds.si)

**Tea Golob**, School of Advanced Social Studies, Nova Gorica | [tea.golob@fuds.si](mailto:tea.golob@fuds.si)

The paper addresses the issue of identifications in European societies embedded in supranational dynamics. The focus is on the national identity, which due to global forces, transnational interdependencies and increasing individualisation takes on different meaning. The study reveals that national identity remains important in people's lives but it co-exists along with supranational identities. National identity is subjected to contemporary global processes, which influence thin cultural sediment in individuals' lives, lacking a strong sentimental meaning. The latter does not mean those sediments are irrelevant. The more intense is the transformation of national

identity and more as its importance in comparison with the traditional semantic fields decreases, the greater is the impact of thin cultural influences. By using Fuzzy-set analysis, we consider which factors operate in favour to thin part of continuum and co-influence on transformation of national identity. We intend to demonstrate the impact of developmental trajectories of societies and deep values, traditional patterns of perception of other nationalities as well as economic and political factors on the conceptual continuum of cultural influences, which enable and condition also the formation of identification with the European space.

## Transnationalism & Translation

**Ipek Demir**, University of Leicester | [id34@le.ac.uk](mailto:id34@le.ac.uk)

My paper will explore the extent to which the insights of translation studies can be called upon when attempting to understand transnationalism and inform cosmopolitanism. Transnational groups not only create new civic

bonds and friendships across the boundaries of states, but also engage in the recovery, salvaging and translation of 'authentic' ethnic and national identity, and in so doing challenge the previously established global hierarchies

and settlements. As such there are 'losses' and 'gains' involved in the salvaging, translation and hence the construction of transnational identities. What is included, and what is excluded in transnational links and activities? How do such links and activities allow diasporic revivals and new interactions with other diasporic groups in the new home, including with the host community? How

should these transnational identities, links and activities inform our understanding of cosmopolitanism and cross border solidarities? By taking the Kurdish diaspora in London and their transnational links within Europe and with Turkey as a case study, the paper will conceptually and empirically investigate such issues.

## 10RN15 - Global, Transnational and Cosmopolitan Sociology (III)

Chair(s): Pertti Alasuutari (University of Tampere)

### The Global Space of International Student Migration

Mikael Börjesson, Uppsala University | [mikael.borjesson@edu.uu.se](mailto:mikael.borjesson@edu.uu.se)

The number of international students has increased steadily and has now reached over three millions. Although the international students only account for around two per cent of the overall student population in the world, they represent far larger shares for certain countries, where they also for some countries such as Australia have come to be an important national source of income. Other countries, with less well developed national educational systems, are dependent upon other countries for providing its population with higher education. Large nations, i.e. China and India, have become very important exporting countries due to the sheer numbers of students they send to other countries for studies. . In Europe, initiatives such as the Erasmus and the Socrates programmes have increased the cross-national migration between European countries significantly. In

this paper I examine the global space of international student migration by analysing the flows of students and more precisely the relation between host countries and countries of origin. Using correspondence analysis a space is constructed on basis of country, where the first dimension separates European host countries and countries of origin from Asian and American host countries and countries of origin, and the second distinguishes France, Spain and Portugal, recruiting large numbers from former colonies, from the rest. The analysis points to three basic logics that structure the global space: a market driven logic that is most characteristic for the Pacific region, an exchange logic that is most expressed in the European countries, and a colonial logic that links some European countries to its former colonies.

### The Double Relativization of Space in the Era of Globalization: Towards a New Social Geography?

Marco Caselli, Università Cattolica del Sacro Cuore, Milan | [marco.caselli@unicatt.it](mailto:marco.caselli@unicatt.it)

A key feature of globalization is the transformation of the role performed by space

in shaping and constraining relations among territories and among people. In this regard, numerous authors have spoken of a “time-space compression”. Thanks to the extraordinary development of means of communication and transport, distances can be covered very rapidly in the case of things and people, and indeed instantaneously in the case of information. Space thus seemingly loses its importance in shaping actions and social relationships: indeed, there are those who speak of the “end of geography”. This view, however, is incorrect. In the age of globalization, the importance of space is different from what it used to be in the past, but it has not diminished. For example, the fact

that certain actors and economic activities are technically free to move from one side of the planet to the other does not debase the specific qualities of spaces; on the contrary, it enhances them: those able to settle wherever they want will choose the best place to do so. To this must be added that not all distances reduce to the same extent, and not in the same way for everybody. So, one witnesses a double relativization of space which qualitatively increases the differences among places and people. More than the compression of space, therefore, one should speak of the distortion of space, with some distances significantly diminishing and others still as long as they have always been.

## Employee Volunteering in Transnational Corporations: Mechanisms of Hybridization and Purification

Itamar Shachar, Ghent University | [itamar.shachar@ugent.be](mailto:itamar.shachar@ugent.be)

Lesley Hustinx, Ghent University | [lesley.hustinx@ugent.be](mailto:lesley.hustinx@ugent.be)

Corporate volunteering, as a particular case of volunteering and corporate social responsibility, emerges at the interface of the non-profit and the for-profit sectors, and blurs the boundary between them. It fuses domains of activity that were traditionally constructed as autonomous, such as work, leisure and civic participation, and conflates private motivations with public concerns. However, corporate volunteering is regularly represented by its advocates as a distinct activity in which private or sectorial interests (e.g. economic and political interests) are put aside in favor of a harmonized commitment for a ‘common good’. Our paper is aimed to explore this dual character of corporate volunteering, and to suggest a theoretical framework for understanding it. In order to do that, we constructed a sample of social responsibility reports issued by several transnational

corporations, and analyzed their sections that were related to corporate volunteering. We analyzed the duality reflected in these texts using theoretical notions developed by Bruno Latour: we claim that corporate volunteering becomes possible through the tensed coexistence between its hybrid character and the discursive attempts to ‘purify’ it. This coexistence enables ‘corporate volunteering’ to proliferate and become successful: it enables to represent the phenomenon differently in various contexts to various audiences, but at the same time constructs it as a unitary phenomenon that can be defined, discussed and promoted. This theoretical and discursive exploration opens future possibilities for studying corporate volunteering, that will follow the networks of hybridization and purification through a multi-sited, transnational ethnography.

## 12\_15JS28 - Glocalisation, Cosmopolitanism, Nationalism and Sport (1)

Chair(s): Renan Petersen-Wagner (University of Durham), Angel Manuel Ahedo Santisteban (University of the Basque Country)

### Is Nationalism the Hegemonic Discourse? The "Empty" Nationalism in Sport and in Other Cultural Fields.

Dieter Reicher, University of Graz | [dieter.reicher@uni-graz.at](mailto:dieter.reicher@uni-graz.at)

Modern professional sport is dominated by sport-events based on international competitions like the Olympic Games or the World Cup. Above all, in the mass-media merely all sorts of sport are interpreted as competitions between nations; even the UEFA Champions League or Formula-1-races. An empirical analyses of the newspaper-coverage of the Olympic Winter-Games from 1932 to 2006 demonstrates that nationalism once was of minor importance. Nowadays, it becomes the hegemonic discourse. This is true not only for the coverage of the sport-events but also for many other newspaper-reports about politics or society during the Olympic Winter Games. The paper also discusses that this kind sport-nationalism has a certain characteristic that distinguishes it from older forms of

„romantic“ nationalism. Sport-nationalism in relation to international sport-competitions does have a strong ethnic-related content. Here, not the pathos of ethnic-uniqueness prevails but that of being „better“ than others in fields of accepted „world culture“. The paper also shows that this kind of ethnic „empty“ nationalism can also be found in other areas of the mass-media like the coverage of film-prizes (the „Oscar“), international beauty-contests, nobel-prizes etc. The study includes also the analyses of internet-fora related to such kind of topics. It can be shown that sport-nationalism coins the „empty“ nationalism in other fields of culture. However, there, nationalism is not in the same degree „hegemonic“ as in the field of sport.

### The Impact of the Local Cross-National Relations on the Olympic Games

Larisa Vdovichenko, Russian State University for the Humanities | [vdlarissa45@yandex.ru](mailto:vdlarissa45@yandex.ru)

This paper presents a sociological analysis of impact of local cross-national relations on the Olympic Games. Preparation and success of Olympic events deeply depends on stability and dynamics of local cross-national relations in the Region of its residence. I'll try to give certain contribution that looks into the role of national factors and characteristics of local cross-national relations in preparation of the 2014 Winter Olympic Games in Sochi. Caucasian Region is characterized by multinational population with very long and complex history. Contemporaneous situation is also not simple. Chechen War, terrorist attacks

and other frictions between different nationalities impacted negatively on the situation in the Region. Nowadays federal and local Powers try to put an end to negative consequences of last events and to change the context of political life and conditions in which conventionally local political decisions are considered and made. From the other side sport contains reserved possibilities of cooperation and solidarity. How the Olympic project ensures positive changes in cross-national relations? Could the preparation and carrying out Olympic Games facilitate the situation in the Region? The paper focuses

attention on this background of the 2014 Winter Olympic Games in Sochi. My analysis builds on media accounts, interviews with officials from the Sochi 2014 Organizing Committee and data's of sociological

monitoring of different materials. The paper gives the description of the situation before the 2014 Winter Olympic Games and provides useful information for an outlook necessary for the global Olympic Movement.

## Interdependence between Sports and World Society

Aleksander Zielinski, UPD Waldau | [milosz13@gmx.ch](mailto:milosz13@gmx.ch)

Ever since its beginnings in the late 19th century modern sports was closely linked to major societal developments in technology, politics, economy etc. Examples include the dominance of the nation-state as administrative unit; the widespread use of technologies of mass communication like television or the fact that many countries boycotted the Olympic Games in 1980 and 1984 for political reasons. It is thus not surprising that recent developments in society (e.g. the process of globalisation) have had a big impact on the domain of sports. At the same time the field of professional sports can be seen as a domain where future developments are being anticipated. Against this background I would like to present some autonomous but interrelated theses and illustrate them with examples from the last twenty years: 1) Politics: The erosion of the nation-state and the emergence and rising importance of

supranational institutions like the EU or the WTO resulted in an increase of power for supranational organisations like UEFA, FIFA or the IOC. This will be discussed on the example of the rights to advertise on major events and the implementation of the Maastricht Treaty via the „Bosman-verdict“ in the 1990s. 2) Economy: The growing dominance of Transnational Corporations in the global economy has led to the emergence of a number of teams which can be seen as „labels“ similar to Coca-Cola or McDonald's, like Bayern München or Real Madrid. People from all over the world (and not just Munich or Madrid) identify with these teams and their players. 3) Technology: The discourse on doping, including arguments for its necessity, can be interpreted as anticipation of the normalisation of the use of neuroenhancements in society

## World Culture, Sport and Nationalism

Dieter Reicher, University of Graz | [dieter.reicher@uni-graz.at](mailto:dieter.reicher@uni-graz.at)

Today, there are more national teams participating Olympic Games (202) or the qualifying round of the World Cup than there are members of the United Nations (193). It seems, every new nation-state has to have its national sport teams as symbols of sovereignty. Thus, nation-sport unifies what seems to be contradictory: world culture and nationalism, universalism and particularism. However, the modern sport system with its dominating mega-events that displays international prestige and nationalism is only

one possible development of sport in the 20th century. There were always alternatives in sport to the system of nation-sport. Some of them like traditional sports and ethnic related sport (like the German Turnen) were not related to cosmopolitanism, at all, but rather to a notion of cultural particularism. Thus, this paper investigates how it was possible that global culture and nationalism coined the modern sport-system. Above all, the paper discusses the characteristics of the sport related nationalism and what distinct this type of

nationalism from other types.

## 13\_15JS28 - Glocalisation, Cosmopolitanism, Nationalism and Sport (2)

Chair(s): Angel Manuel Ahedo Santisteban (University of the Basque Country), Renan Petersen-Wagner (University of Durham)

### Football Fans as Subcultural Actors of Glocalisation: Notes from the Field in Croatia

**Benjamin Perasović**, Institute of Social Sciences Ivo Pilar, Zagreb | [Ben.Perasovic@gmail.com](mailto:Ben.Perasovic@gmail.com)

**Marko Mustapić**, Institute of Social Sciences Ivo Pilar, Zagreb | [Marko.Mustapic@pilar.hr](mailto:Marko.Mustapic@pilar.hr)

One of the key effects of globalisation process is weakening of the nation state (Beck, 2000). There is also parallel process of glocalisation (Robertson, 1994). From the 1950-s, youth subcultural styles dispersed from anglo-saxon 'core' to various peripheries, contributing to our knowledge of global-glocal relation. Gulianotti and Robertson (2007) consider sport as clear example of interferences between globalisation and glocalisation, and Pilkington (2004) emphasized the importance of youth cultural strategies that manage glocal lives. Within the history of European modernisation processes, Croatian society was always at the periphery. Croatian transition was determined by the Homeland war 1991-1995 (Rogić, 2000). Our research is a part of FP7 project MYPLACE. Main method was ethnography (9 months of field work, extensive diaries, 25 in-depth interviews with core members of

Torcida), and the aim of this study is to explore football fans subculture in Croatia and its role in glocalisation process. Subculture of football fans became topic of sociological research in the second half of the 1980-s. One of the main characteristics of Torcida is passionate involvement in construction of Croatian national identity, with the emphasis on the Homeland war. Our research showed that the spectrum of meanings of national identity within Torcida goes beyond dichotomy 'nationalism vs. globalisation'. The play with ascribed and achieved identities within the subculture of the fans indicates multidimensionality of the glocal life. Good example is relation of Torcida to Croatian football federation, UEFA, FIFA and boycott of the national team during qualifications for the World Cup 2014.

### Do Sports Audiences Shift their Attention more and more to the "Transnational" Level?

**Michael Mutz**, Georg-August University, Göttingen | [michael.mutz@sport.uni-goettingen.de](mailto:michael.mutz@sport.uni-goettingen.de)

Processes of globalisation have become one of the most popular topics of various social science disciplines, not least sport sociology. Globalisation becomes particularly visible in

professional sport, e.g. in form of player migration, international sports governance or global sport events. Some scholars thus argue that professional sport has yet become one of

the driving forces of globalisation. However, sports audiences are a less thorough researched subtopic within this field. Do sports audiences gradually shift their attention away from domestic sports leagues and sport events? Are audiences more interested today in leagues, competitions, or athletes from foreign countries? By using European football as an example, the paper analyses inasmuch sports audiences are becoming more and more "transnational" in terms of their awareness and attention towards football leagues and football clubs. This presumed shift of attention from domestic clubs to expatriate clubs is empirically investigated with the help of google search statistics. Queries made by a person in

country A but addressing a football club in country B, C, D etc. can be regarded as expressions of transnational attention. These "transnational" google queries are analysed systematically over a period of six football seasons (2005/06-2011/12). Results indicate that the attention towards expatriate football clubs has indeed increased over time. Furthermore, the rise (and decline) of attention towards expatriate football clubs can be explained systematically, e.g. with the success of a club in a European competition. Findings from the world of football are thus backing the widespread notion that the significance of the nation-state is vanishing nowadays.

## **Sport Mega-Event in Central-European Context: What is the Legacy of UEFA EURO 2012 in Poland?**

**Agata Dembek**, University of Warsaw | [agata.dembek@gmail.com](mailto:agata.dembek@gmail.com)

**Renata Włoch**, University of Warsaw | [renatawloch@gmail.com](mailto:renatawloch@gmail.com)

The paper analyses the multidimensional impact of the third largest sport mega-event in the world UEFA EURO 2012 on Poland. Poland and Ukraine were granted the right to host the European Championships in 2007; for both countries it was the first event ever of this magnitude to organize. The paper will critically address the issue of legacy of the Championships in two chosen dimensions: political and social. From the political point of view the Championships were the situation of quickened learning of the new global rules of interaction for the Polish government; it had to learn how to negotiate the rules of engagement and the borders of its sovereignty with one of the most powerful global governors (UEFA). It evoked the necessity of far-going structural, institutional and legal adaptations. In the area of social life the Championship

were used, mainly all by the third-sector organizations, as an opportunity to introduce and develop the issues of social integration, the condition of civil society, volunteering, the auto-perception of the Polish society and national sentiments, as well as sport-for-all. The main thesis of the paper is that the Championships, and UEFA itself, played the role of an exogenous stimulus, accelerating, on the one hand, the (somewhat painful) adaptation to the *modus operandi* in a globalized world for the Polish state, and on the other hand, creating a foundation and opportunity for quickened pace of social change. The argument will be based on the extended research carried in 2008-2012 by a think-tank Social Action 2012, affiliated at the University of Warsaw.

## RN16 - Sociology of Health and Illness

### a01RN16 - Chronic Illness I: Risk, Survival and Disruption

Chair(s): Zvika Orr (The Hebrew University of Jerusalem)

#### Male Breast Cancer: A Sociological Study of Dealing with Risk and Gender Identity

Anne-Elisabeth Driessen, University of Amsterdam | [lieke.driessen@gmx.net](mailto:lieke.driessen@gmx.net)

Christian Bröer, University of Amsterdam | [c.broer@uva.nl](mailto:c.broer@uva.nl)

Tom Horlick-Jones, University of Cardiff | [Horlick-JonesT@cf.ac.uk](mailto:Horlick-JonesT@cf.ac.uk)

Breast cancer care is unsurprisingly tuned to the needs of women, creating the possibility of leaving men to feel exotic and as outsiders. This paper introduces the term gynaenormativity to describe how the female body is taken as standard in breast cancer care. Gynaenormativity is inherently tied to risk, as it limits risk awareness in both general practitioners and males. The article addresses relations between the illness experience, risk and gender identity of men with a breast cancer diagnosis. It describes in which ways

the focus on femaleness is manifest in mass print media and addresses situations in medical practice that reinforce MBC as an exception. A typology of three kinds of patient behavioural responses to gynaenormativity is presented. Overlapping risks and the possible relationship with an analysis of hazard adjustment drawing on Mary Douglas' work on risk are elaborated upon. The effects of increased attention to breast cancer in males are discussed.

#### Risk of Hereditary Breast Cancer as Biographical Disruption

Maruta Pranka, Latvia University | [pranka@latnet.lv](mailto:pranka@latnet.lv)

Agnese Dzervite, Riga Stradins University | [agnese.dzervite@gmail.com](mailto:agnese.dzervite@gmail.com)

Ritma Rungule, Riga Stradins University | [ritma@lza.lv](mailto:ritma@lza.lv)

Janis Gardovskis, Riga Stradins University | [Janis.gardovskis@rsu.lv](mailto:Janis.gardovskis@rsu.lv)

Edvins Miklasevics, Riga Stradins University | [edvins.miklasevics@rsu.lv](mailto:edvins.miklasevics@rsu.lv)

Diagnosis of inherited breast cancer gene is a crisis and biographical disruption essentially changing individual identity. The attention in the paper is allocated towards the ways women try to come to terms with inherited gene mutations that have or may affect them and their offspring over several generations. Knowledge of genetic risk may have many

interpretations and consequences for individual and family identity building. The report presents analyses of biographical interviews with 14 healthy and ill breast cancer BRCA1 and BRCA2 carriers. All of them had experienced suffering from cancer of their closest relatives. M. Bury's concept of biographical disruption has been a leading

framework for the chronic illness studies in sociology. The main problem in biographical disruption is inability to connect the present identity with the previous self understanding. In the paper concept biographical disruption is expanded and involves not only hard illness but also its potentiality, the feelings of the illness risk. The biographical work done by respondents to understand and navigate their identity being in crisis is discussed. Though necessary psychological support is provided by the closest network there is a lack of

informational, psychological support from qualified medical staff. Continuous crises and shortage of finances of the state health care system, careless attitude of general therapists to the persons in risk of breast cancer deepen problems and the individual crisis of gene careers. The data are obtained in a research project financially supported by the European Social Fund (2009/0230/1DP/1.1.1.2.0/09/APIA/VIAA/070), conducted at Riga Stradins University (2010 – 2012).

## **The Limitations of Biographical Disruption Approaches: The Case of Adult Survivors of Childhood Liver Transplant.**

**Karen Lowton**, King's College, London | [karen.lowton@kcl.ac.uk](mailto:karen.lowton@kcl.ac.uk)

**Chris MH Hiley**, King's College, London | [chris.hiley@kcl.ac.uk](mailto:chris.hiley@kcl.ac.uk)

**Paul F D Higgs**, University College, London | [p.higgs@ucl.ac.uk](mailto:p.higgs@ucl.ac.uk)

Ageing is often understood as being entwined with the development of chronic and disabling conditions. Much has been written about the way in which the presence of these can be viewed either as a form of 'normal ageing' or as disrupted biographical narrative; the latter approach being based upon normative expectations of health at different stages of life. However, this can be problematic in relation to the oldest sections of the population where notions of what is 'normal' are difficult to establish. In this paper we further question the utility of biographical disruption as a concept in relation to the first cohort of children who successfully underwent liver transplant in the mid-1980s. This group is now in early-middle age and is the subject of an ongoing study into the now-adults'

biographical sense of self. One key aspect of our study is that this group challenges the notion that straightforward biographical narratives can be established for individuals who are biomedical pioneers of treatments. These individuals live out their whole lives as a form of biographical contingency as the consequences arising from the early intervention play out in their adult lives. To date there have been no comparison groups which could allow this group to situate their ageing within a 'normal' biographical narrative. Whilst this is a small group, studying their circumstances offers us an insight into what constitutes and challenges normal ageing in contemporary society. This paper reports how these issues feature in the lives of this study group.

## **How to Manage 'Being Genetically at-Risk'**

**Tabea Eißing**, Helmut-Schmidt University, Hamburg | [t.eissing@hsu-hh.de](mailto:t.eissing@hsu-hh.de)

**Maya Uygun**, Helmut-Schmidt-Universität, Hamburg | [m.uygun@hsu-hh.de](mailto:m.uygun@hsu-hh.de)

Risk as one defining cultural characteristic of Western societies takes a (new) shape in the

context of biomedicine as genetic risks. Through predictive genetic tests a mutation

can be identified which is associated with a higher risk of developing a disease in the future. The paper draws on experiences of women affected by a genetic risk for Breast and Ovarian Cancer drawn from the ongoing social science research project “Genetic Discrimination in Germany”. Numerous uncertainties go along with a conspicuous result from a predictive genetic test. The predictive diagnosis doesn’t make a statement if a person will fall ill at all or what shape the course of the disease will take. Life plans may have to be negotiated in a new way. Affected women have to face the question of inheritance, too. They ask themselves: ‘Do I pass on the genetic predisposition to my children?’ Uncertainties extend to concerns for

adverse treatment in different social contexts. Even though women did not experience enacted discriminations, they anticipate discrimination at work, in insurance contexts and in private relationships. I illustrate how women manage ‘being genetically at-risk’. These illustrations will be connected with the concept of ‘chronic risk’. I propose that this concept is a comprehensive perspective to describe and understand the management of ‘being genetically at-risk’. In the end I reflect on social impacts that may go along with accepting genetic risks as chronic risks on organizational level and with grant persons concerned the status of severely disabled persons referring genetic exceptionalism.

## **b01RN16 - Mental Health**

Chair(s): Piet Bracke (Ghent University)

### **Gender Differences in Depression by Type of Household: Effects of Financial and Housework Contributions**

Rozemarijn Dereuddre, Ghent University | [Rozemarijn.Dereuddre@ugent.be](mailto:Rozemarijn.Dereuddre@ugent.be)

Piet F. Bracke, Ghent University | [piet.bracke@ugent.be](mailto:piet.bracke@ugent.be)

Studies that focus on the effects of both the division of household chores and financial contributions on the mental health of couples are scarce. This paper extends previous research by paying attention to the variation in this relationship among three types of households: male breadwinners, one-and-a-half-earners and dual-earners. Our analysis is based on paired data from the tenth wave of the Panel Study of Belgian Households, collected in 2001. We perform separate linear regression models for men (N = 1054) and women (N = 1054). The results show that men in one-and-a-half-earner households are more

depressed compared to men in male breadwinner households. Concerning financial contributions, men in dual-earner households report higher depression scores when their spouse is more financially independent. Both results suggest that in one-and-a-half-earner households women’s employment is negative for their partners’ depression level and that in dual-earner households women’s employment is only negative if men are not the major breadwinner. Finally, crossover effects of depression between spouses and relational commitment seem to mediate part of the aforementioned associations.

## Birth Order and Suicide: Evidence from Swedish Total-Population Data.

Mikael Rostila, Stockholm University/Karolinska Institutet | [mikael.rostila@chess.su.se](mailto:mikael.rostila@chess.su.se)

Jan Saarela, Åbo Akademi University/University of Helsinki | [jan.saarela@abo.fi](mailto:jan.saarela@abo.fi)

Ichiro Kawachi, Harvard School of Public Health | [ikawachi@hsph.harvard.edu](mailto:ikawachi@hsph.harvard.edu)

**Background:** Suicide is among the three leading causes of death in people less than 25 years of age. Birth order has been linked to heightened risk of suicide risk factors and suicide. **Methods:** We conducted a follow-up study for Swedes born 1932-1980 based on register data covering the total population (n=1,617,010) with a possible follow-up between 1981 and 2002. We examined suicide risks by birth order in adult sibling groups by means of fixed effect models. **Results:** We found that birth order was associated with an increased suicide risk within sibling groups. Each increase in birth order was related to an 18 per cent higher suicide risk among individuals born 1932-1980. In younger sibling groups (born 1967-1980) the corresponding

estimate was higher although non-significant (1.24, CI 0.97-1.57) while it was somewhat lower in older sibling groups (1.13, CI 1.06-1.21). Further analyses suggested that the birth order effect was only modestly influenced by socioeconomic position and socioeconomic rank within the sibling group. We also found a difference in the birth order effect between men and women saying that men's suicide risk are more strongly influenced by birth order. **Conclusions:** Our findings suggest a birth order effect on suicide in Sweden and that this effect could not be explained by lower socioeconomic circumstances among later born siblings. Factors explaining gender differences in the association between birth order and suicide should be further investigated.

## Childhood and Mid-Life Social Position and Antidepressant Medication: A Prospective Analysis Using Swedish Registers

Loretta G Platts, Imperial College London | [L.platts10@imperial.ac.uk](mailto:L.platts10@imperial.ac.uk)

Ruzan Udumyan, Örebro University Hospital | [Ruzan.Udumyan@orebroll.se](mailto:Ruzan.Udumyan@orebroll.se)

Scott M Montgomery, Örebro University Hospital | [scott.montgomery@orebroll.se](mailto:scott.montgomery@orebroll.se)

**Background.** Childhood social position and material circumstances are associated with adult major depressive disorder, but whether childhood factors continue to be important after taking account of social position and economic circumstances in adulthood is unclear. **Methods.** Cox modelling for receipt of antidepressant prescription was performed to determine associations with childhood and adulthood social position and material circumstances using a register linked population of 234 128 enlisted Swedish men born 1952-1956. Information on childhood and mid-life circumstances were obtained from the 1960 and 1985 Population and Housing

Censuses. The Swedish Prescribed Drugs Register provided records of antidepressants received July 2005-June 2010. **Results.** The five-year period prevalence of antidepressant use was 28 per 1000 person years. Increased receipt of antidepressants was associated with the childhood household being overcrowded (HR=1.03), the dwelling being rented (HR=1.09) and the household head lacking gainful employment (HR=1.32), but not with material deprivation. Individuals had higher rates of receiving antidepressants if in mid-life they were divorced, separated or unmarried (HR=1.38, 1.28 and 1.05, respectively); not gainfully employed (HR=1.44); held a semi-

unskilled manual occupation (HR=1.16) or a routine clerical/sales occupation (HR= 1.19); or had lower incomes (HR=0.90 per quintile increase). Childhood and mid-life circumstances were associated independently with antidepressant use in late mid-life.

Conclusions. Factors from a range of socioeconomic domains in both childhood and adulthood were associated with receipt of antidepressant medication, suggesting risk accumulates over the life course.

## Excess Mortality after Disability Retirement Due to Mental Disorders: Variations by Socio-Demographic Factors and Causes of Death

Taina Leinonen, University of Helsinki | [taina.leinonen@helsinki.fi](mailto:taina.leinonen@helsinki.fi)

Eero Lahelma, University of Helsinki | [eero.lahelma@helsinki.fi](mailto:eero.lahelma@helsinki.fi)

Mikko Laaksonen, Finnish Centre for Pensions/ University of Helsinki | [mikko.laaksonen@etk.fi](mailto:mikko.laaksonen@etk.fi)

Mental disorders are key causes of disability retirement and are associated with a high risk of mortality. Social variations in excess mortality after disability retirement are nevertheless poorly understood. We examined socio-demographic differences in all-cause and cause-specific mortality after retirement due to depression and other mental disorders. The data comprised a nationally representative sample of the Finnish population aged 25–64 in 1996 with no prior retirement due to mental disorders (N=392,985). We used Cox regression analysis with disability retirement due to mental disorders as a time-varying covariate and mortality between 1997 and 2007 as the outcome variable. We found excess mortality after retirement due to mental disorders as compared to those with no such retirement in all specific causes of death, in particular alcohol-related causes, suicide, and other

unnatural causes. Excess mortality was larger after retirement due to other disorders than depression except in suicide. Younger age groups, non-manual classes, and those living with a partner and children had largest excess mortality especially from unnatural and alcohol-related causes. However, the absolute number of excess deaths was not always largest in these socio-demographic groups. In young adulthood retirement due to mental disorders signifies severe health and other social disadvantages that lead to particularly large excess mortality especially due to unnatural causes. The protective effects of a high socioeconomic position and family ties against unnatural and alcohol-related deaths are limited among those who have already developed severe mental illness that has led to disability retirement.

## **b0219JS16 - Patients, Citizens and Professionals in Europe: Modern Health Care Societies in Crisis**

Chair(s): Gunnar Scott Reinbacher, Ruth McDonald

### **Italian Dentistry and the Crisis: How Profession is Changing**

**Elena Spina**, Marche Polytechnic University | [e.spina@univpm.it](mailto:e.spina@univpm.it)

**Giovanna Vicarelli**, Marche Polytechnic University | [m.g.vicarelli@univpm.it](mailto:m.g.vicarelli@univpm.it)

**Emmanuele Pavolini**, Macerata University | [e.pavolini@unimc.it](mailto:e.pavolini@unimc.it)

The Italian dental sector comprises 54,110 dentists, of which 3,500 work for the public health system or in contracted structures, while the majority works in the 41,000 private dental practices scattered across the national territory. Only 12.5% of patients is treated in public or semi-public facilities, 5% receive completely free dental care and 86% have to pay totally out-of-pocket for their dental treatment. For some time this sector has been experiencing some very difficult challenges to the traditional systems that have existed for years. These challenges come from different interacting factors mainly attributable to the economic crisis. On one hand, since dental treatments are predominantly provided by private practitioners, the average annual number of dental visits has decreased in particular since 2008. On the other hand dentists are seriously exposed to the market as

they are facing an increasing amount of competition that low cost franchising multinationals had brought into the Italian market. It also concerned with the increasing phenomenon of dental tourism through which individuals are seeking dental care outside of the Italian healthcare system. Using available national and European statistical data as well as the main results of empirical qualitative research, the paper focuses on the effects of the economic crisis on the dental profession. Two analytical dimensions will be explored. On one hand, we will try to evaluate the effects of the economic crisis in terms of reduction of oral health-related consumption and the related social inequalities. On the other, we will focus on professional strategies that Italian dentists are developing in this period to respond to change.

### **Long-Term Healthcare in Europe: How to Staff the Future Health Professional Workforce?**

**Ellen Kuhlmann**, University Siegen | [e.kuhlmann@em.uni-frankfurt.de](mailto:e.kuhlmann@em.uni-frankfurt.de)

**Christa Larsen**, Goethe-University, Frankfurt | [C.Larsen@em.uni-frankfurt.de](mailto:C.Larsen@em.uni-frankfurt.de)

Long-term care (LTC) is one of the most challenging policy areas in European countries. Despite growing awareness of the problems and improved data, existing institutional reforms do not respond effectively to demographic change. This paper provides an overview of the challenges of future health human resources in LTC in Europe; we focus

on the nursing workforce and a systematic connection of contemporary and prospective analyses of the use of LTC services/demand and LTC professionals/health human resources. In terms of method, we draw on secondary analysis of the literature and analysis of public statistics, especially OECD data. The European approach brings high

variation in future demand for LTC into view. Especially problematic are countries, like for instance Germany, where a number of problematic trends combine and create a negative scenario: a growing demand for LTC meets with decreasing health human resources on the supply side. The situation is even worse in several central-eastern

European countries, like for instance Poland, where migration of health professionals widens the gap between demand for services and human resources. We conclude by suggesting intervention strategies that may reduce problematic dynamics of demographic change, health policy and geo-political conditions.

## Consequences of Italian Healthcare Reforms on Medical Profession

Federico Sofritti, University of Florence | [federico.sofritti@gmail.com](mailto:federico.sofritti@gmail.com)

Healthcare has changed a lot during the last decades of the Twentieth century within Western societies: reforms have been implemented to face the increasing challenges of health systems in a context of crisis of the welfare state's bedrocks. The most important issue of these reforms is the introduction of market's principles in public work organizations; as a result, the logics of work in healthcare have changed. The focus of my research is on the consequences of health reforms on medical doctors' professional identity, particularly with the introduction of 'organizational professionalism' in a context characterized for decades by 'occupational professionalism': organizational techniques such as New Public Management emphasize the distinction between managerial and professional mentalities and ways of working. The aim is to cope with the hypothesis that

organizational transformations introduced with the 'commodification' of healthcare affect several dimensions of doctors' identity such as the general concept of profession, professional ethos, and Medical Dominance, letting appear a new medical professionalism. My presentation deals with the findings of an empirical study based on semi-structured interviews involving two groups of doctors: the former socialized before the Nineties' reforms and the latter in post-reforms Italian health system. The area of study is a Tuscan 'District', local health organization which has acquired increasing organizational autonomy and significance as Primary healthcare (Phc) institution. I will stress the impact of managerialism and consumerism on professionals' autonomy, the relationship between doctors and managers, and the modification of medical skills.

## Crisis, Marketization and Changes in the Professional Ethics of Medical Doctors

Evelien Tonkens, University of Amsterdam | [e.h.tonkens@uva.nl](mailto:e.h.tonkens@uva.nl)

Margo Trappenburg, University of Amsterdam | [m.j.trappenburg@uva.nl](mailto:m.j.trappenburg@uva.nl)

Under pressure of rising costs and the global and financial economic crisis, many European governments try to reduce spending and increase efficiency by fortifying marketization of health care. Marketization is supposed to increase efficiency and service-mindedness but otherwise be neutral when it comes to professional ethics. In this paper we study this

claim empirically, focusing on medical doctors in the Netherlands. How does marketization of health care influence professional ethics of medical doctors? Based on in-depth interviews with 85 medical specialists from five specialisations with varying degrees of marketization (general practicioning, surgery, internal medicine, child medicine and

anaesthesiology) we found that their professional ethics is seriously influenced in four respects. They are indeed more concerned with efficiency and patient friendly behaviour, as was intended. However, their ethics is also influenced in three less desired and intended ways. First, they spend more time and energy on advertising. Second, they move their attention from distribution according to need towards distribution according to expected profit. Third, for most of them - surgeons

excepted - the harm principle is less prominent in their daily practice; they spend less time talking (to prevent or postpone potentially harmful medical interventions) and more quickly turn to medical interventions. On account of these last three factors, many of them are critical towards marketization. However, they feel they can exercise very little influence on the process, and therefore are not tempted to raise their voice.

## Increasing Mobility – Reaction to the Crisis?

**Eszter Kovacs**, Semmelweis University, Budapest | [kovacs.eszter@emk.sote.hu](mailto:kovacs.eszter@emk.sote.hu)

**Edmond Girasek**, Semmelweis University, Budapest | [girasek@emk.sote.hu](mailto:girasek@emk.sote.hu)

**Gabor Szocska**, Semmelweis University, Budapest | [szocska.gabor@gmail.com](mailto:szocska.gabor@gmail.com)

**Miklos Szocska**, Semmelweis University, Budapest | [szocska@emk.sote.hu](mailto:szocska@emk.sote.hu)

Health professionals and patient mobility gets wider attention in contemporary research, since mobility has showed increasing volume in the last few decades. Due to the EU legislation 2005/36 Directive ensures the mutual recognition of qualifications, thus, mobility of health professionals is facilitated within the EU; further, 2011/24 Directive on patients' rights in cross-border healthcare might trigger patient mobility, that is, patients traveling with the intention of obtaining medical services, treatments abroad. The aim of the present paper is to explore the motivational background and key drivers of health professionals' and patients' mobility based on the findings of ECAB research project. Qualitative in-depth and focus group interviews were conducted with health professionals on the key drivers for mobility. Motivational background of patient mobility

was measured by patient survey and patient experience interviews. Additionally, official statistics and previous survey results were reviewed. Health professionals stated that licensing procedures do not differ in EU Member States that might facilitate mobility. Moreover, of the motivational factors financial opportunities, future perspectives, prestige, organization culture and special technology are underlined. From the patients' aspect, mobility of is often based on affordable prices, better quality, avoiding waiting lists and combination with vacation. As a conclusion we emphasize that financial reasons are significant factors behind both forms of mobility. The crisis itself brought uncertainty and financial difficulties into people's lives, thus, health professionals and patients tend to mobilize themselves to save while entering health systems abroad.

## a02RN16 - Chronic Illness II: Experiences and Recognition

Chair(s): Ana Patricia Hilario (Center for Research and Studies in Sociology - University Institute of Lisbon)

### Recognising Identity among Those with Chronic Illnesses: A Key to Economic Recovery?

Carol L.R. Ellis, University College Dublin | [carol.ellis@ucdconnect.ie](mailto:carol.ellis@ucdconnect.ie)

The forecast for chronic illness has projected that an additional 523,000 people will suffer from a chronic illness by 2020 (Institute of Public Health, Ireland). This paper aims to display that recognising identity among those with chronic illnesses can lead to both improvements in quality of life and reforms in health expenditure. The case study is the chronic autoimmune illness systemic lupus erythematosus (SLE), where relief is reliant on the management (Greco et al. 2004) and coping strategies (Bricou et al. 2006) of the individual. SLE places the individual's performance within daily life in uncertainty, where status, roles and routines fluctuate, effecting the individual's well-being socio-economically. This paper will examine how social frameworks (relationships, employment and healthcare) contribute

towards well-being and life quality, providing insight into the social identity of the individual with SLE and the subjective experiences of this chronic illness. The issue of chronic illness is both personal and social which makes the issues an ideal subject for sociological study, as it provides a concrete route to understanding the interaction between 'private troubles and public affairs' (Mills 1959). The research will provide insight in how the individual with SLE adapts and accultures to their new identity, due to performance and role change, examining their perspectives and experiences as the individual with an illness that is triggered by social stressors (Avitsur et al. 2006; Stonjanovich 2010; Roussou et al. 2011) lives within a stressed economic climate.

### When Having to Eat Differently Complicates Social Relations

Cleto Corposanto, Università degli Studi Magna Graecia, Catanzaro | [cleto.corposanto@unicz.it](mailto:cleto.corposanto@unicz.it)

Beba Molinari, University of Genoa | [beba.molinari@unige.it](mailto:beba.molinari@unige.it)

In the family microcosm, in the context of associations both at national and international level, in clinical environments diagnosis and medical research are often discussed, but despite this lifestyles of people with celiac disease are far less debated. Accordingly, common life issues have been studied in deep trying to understand how celiac disease modifies everyday life, scholastic and/or working routine, family dynamics and specifically the approach to food experienced as a moment of socialization with friendship

groups. Inquiry main goals are first to investigate the lack of compliance to the diet as a deliberate decision and then to rebuild, through a survey of 3,000 celiacs representative of the national situation (Ministry of Health, 2011), a theoretical as well as analytical scenario concerning needs and problems of a gluten free diet, in order to define strengths and weaknesses of daily living with celiac disease. Given the subject of the conference and the importance of social cohesion in its micro-macro facets, this paper

is going to discuss some of the issues directly related to these aspects, focusing attention on the significant contribution that the Associazione Nazionale Celiachia makes to improve celiacs' quality of life. The association, representing the needs of its members (micro level), and acting as an intermediary with

public institutions both at national and regional level (macro level), will make us understand how a primary social network can, over the years, become a network so wide to spread through the entire national and European territory and be recognized as a social actor, carving out an active role in policy-making.

## **Social Networks and Chronic Illness Management: A Critical Interpretative Synthesis**

**Ivaylo Vassilev**, University of Manchester | [ivaylo.vassilev@manchester.ac.uk](mailto:ivaylo.vassilev@manchester.ac.uk)

**Anne E. Rogers**, University of Southampton | [a.e.rogers@soton.ac.uk](mailto:a.e.rogers@soton.ac.uk)

**Anne Kennedy**, University of Southampton | [a.kennedy@soton.ac.uk](mailto:a.kennedy@soton.ac.uk)

There is a large body of literature exploring the link between social networks, social capital, and social support for health relevant outcomes such as health status, health behaviours, illness management, and well-being. However, while there is a general agreement that social connectedness and social support tend to be positively associated with health relevant outcomes, the direction and nature of this association becomes less clear once it is examined more closely and within different empirical contexts. For example, some authors have argued that large, dispersed networks are good for health as they give access to a wider range of resources and health relevant information, while others have claimed that small, tightly-knit networks with higher frequency of interaction are more beneficial for health. In this paper we focus on

people with chronic illness and argue that a better understanding of the mechanisms that link social networks and chronic illness management, could lead to developing a clearer conceptualisation and theorisation of the underlying structures involved, and could also illuminate some of the apparently contradictory findings in empirical research. We draw on qualitative meta-synthesis and critical interpretative synthesis in reviewing the literature. Such an approach is appropriate here because its main focus is on developing a critique of underlying assumptions, and asking questions such as 'how' and 'why', rather than on identifying recurrent patterns. Our findings indicate that the mechanisms through which chronic illness management networks operate could be understood around three broad themes: work, influence and collective efficacy.

## **People Living with HIV in the USA and Germany: A Comparative Study of Biographical Experiences with Health-Services and Illness**

**Lauren M Kaplan**, Goethe University, Frankfurt | [laurenkaplan5@gmail.com](mailto:laurenkaplan5@gmail.com)

**Lena Inowlocki**, University of Applied Sciences | [inowlocki@soz.uni-frankfurt.de](mailto:inowlocki@soz.uni-frankfurt.de)

**Heidemarie Kremer**, University of Applied Sciences | [HeidemarieKremer@yahoo.de](mailto:HeidemarieKremer@yahoo.de)

**Gail Ironson**, University of Miami | [gironson@aol.com](mailto:gironson@aol.com)

Research Question: Long-term care of people living with HIV (PLWH) is a major health

concern in the USA and Germany. To detect issues HIV-services may target to improve

PLWHs' quality of life; this study examines how PLWH experience their illness and how the different social and medical care contexts are related to well-being. Methods: We compared autobiographical-narrative interviews with English-speaking migrant and native PLWH recruited at a German urban HIV-clinic (n=8) and in a metropolitan area of the USA (n=8). Results: PLWH in both locations emphasized the social context of access to effective antiretroviral therapy as a time where HIV is no longer conceived as a death sentence. Openness about HIV-status was related to AIDS-activism. Yet, fears of HIV-disclosure remain, particularly among migrants. The former US immigration ban for PLWH was a barrier to HIV-disclosure and health care access. The German mandatory dispersal of

asylum seekers in remote reception centers was related to social isolation. The role of the German health care system in providing coverage of HIV-medication and internationally-focused specialist care was emphasized as integral to patients' health. In the USA, participants had to remain in poverty in order to qualify for drug assistance programs. Conclusions: Stigmatizing immigration policies should be reviewed to enhance treatment uptake and HIV disclosure. Initiatives geared towards improving the health of HIV-patients should: integrate strategies to enhance HIV-medication coverage for both native and migrant patients, allow PLWH to pursue their economic aspirations, and can be informed by biographical policy analysis.

## **b02RN16 - Health Care Systems: Crises and/or Reforms?**

Chair(s): Jonathan Gabe (University of London)

### **The Healthcare System in Spain: From Decentralization to Economic Current Crisis.**

**Marta Aguilar**, Universidad De Sivilla | [maguilar6@us.es](mailto:maguilar6@us.es)

**José María Bleda**, Universidad De Castilla-La Mancha | [jose.bleda@uclm.es](mailto:jose.bleda@uclm.es)

Spain's Transition to Democracy set the stage for the organization of a national healthcare system. The adoption of the Spanish Constitution of 1978 was a political milestone that led to the recognition of every citizen's right to healthcare and the right of autonomy of the various regions that make up the Spanish State. The most distinctive characteristic of the healthcare model set up in those early years of political transition was the decentralization of

the healthcare system which transferred political and administrative power on matters of public health to the 17 autonomous communities. It took more than 20 years to complete this decentralization process. This evaluative analysis will examine the pros and cons of decentralization and also changes to the current economic crisis are having on the Spanish healthcare system.

## The Impact of the Crisis and of the Policies of Austerity on Euro-Mediterranean National Health Services and the Role of Civil Society

Guido Giarelli, Università degli Studi Magna Graecia, Catanzaro | [guido\\_giarelli@tin.it](mailto:guido_giarelli@tin.it)

The economic and financial crisis taking place globally since 2007 has produced in Europe the "sovereign debt" crisis, which has particularly affected the Euro-Mediterranean countries, the so-called "PIGS" (Portugal, Italy, Greece and Spain). The responses implemented by the European governments to this situation have been dominated, in most cases, by the austerity policies required by the EU, the CEB and the IMF, primarily aimed at controlling inflation and reducing public expenditure, with strong recessionary effects. These policies are having consequences for Euro-Mediterranean health systems geared to the "Beveridge" model of the National Health Service that go far beyond even the necessary containment of inefficiencies and the rightful contribution to the consolidation of public finances. This is already particularly evident in Greece, where

very hard cuts were imposed on an health care system already in crisis and the consequences in terms of worsening of the health conditions of the population are quite evident; and in Spain, where in spite of the enviable achievements of the health care system in recent years in both the development of an innovative territorial primary care and in the health of the population, the reform introduced on April 2012 privatized the public system by reintroducing the insurance system in force during the Franco regime. The paper aims to investigate, by the presentation of some significant indicators, the impact of the crisis and austerity policies on the National Health Services of the Euro-Mediterranean countries with a comparative perspective, discussing the role that civil society can play with respect to the dominant neo-liberal policies

## The Role of Organized Business Interests in Public Health Care Reform

Johannes Kananen, University of Helsinki | [johannes.kananen@helsinki.fi](mailto:johannes.kananen@helsinki.fi)

Previous research has showed that a strengthened position of organized business has been associated with the increased prominence of economic and market-centered ideas in politics. Focusing on a country with a National Health Service in transition, i.e. Finland, the paper will assess the role of organized business in the process of reforming primary and secondary health care provision. The paper will draw on the advocacy coalition framework that views actors of various governmental and private organizations as potential members of coalitions that co-ordinate their actions over time in order to achieve their goals in politics. The paper consists of three parts. First, the increased role of private actors in Finnish health care provision is reviewed. Second, the rationales of the most relevant recent legislative reforms in

the area of health care provision will be compared with views expressed in interviews with potential members of advocacy coalitions. Relevant reforms concern both the administrative structure of care provision and competition law regulating the outsourcing of public services. Interviewees include members of relevant government departments, research centres, think tanks and interest group organizations. The third, concluding part summarizes the findings, according to which policy reform has progressed in the direction of opening up health care provision for private providers in a way that is in accordance with business interests. Although the policy making process has been complex and involving consensus and compromise between different actors, an influence of business interests seems likely, raising questions of transparency

in the policy making process.

## Social Private Healthcare Services: A New Model against Crisis?

Annabella Corcione, National Research Council - CNR | [a.corcione@irpps.cnr.it](mailto:a.corcione@irpps.cnr.it)

In Italy the access to public healthcare services has become difficult for many factors. There are lots of economic and/or efficiency problems such as very long waiting lists for specialist visits, reduction in public funding, the closing of hospital wards, low quality services. On the other hand, also many private health services are in crisis, for the decreasing role of private 'not profit' system as public service supplier. In Italy the private health sector has reached a significant size. So, we can notice the creation of a new model of private health services, in which specialists associate to provide low cost visits, lower than those provided by private for profit system, and

in some cases similar to the ticket patients would pay in the public sector. We think this phenomenon is very interesting to analyze, as it involves all four actors: state, private for profit, private no profit, citizens. The paper describes whether and how crisis has affected healthcare access and presents data on the phenomenon we could call "social private healthcare services". The data are both quantitative (diffusion in Italian towns, number of doctors/ nurses/patients involved, etc.) and qualitative, with a survey on healthcare managers and patients who turn to these private healthcare centers.

## A Critical Evaluation about "Transformation in Health Program"s Effects in Turkey

Ayca Gelgec Bakacak, Hacettepe University | [abakacak@hacettepe.edu.tr](mailto:abakacak@hacettepe.edu.tr)

Cem Koray Olgun, Hacettepe University | [simulacr@gmail.com](mailto:simulacr@gmail.com)

This study aims to describe new inequality and crisis fields which have been revealed by "Transformation in Health Program" that has been applied in Turkey. Turkey has been a part of economical transformation which has been taking place all over the world since 1980's and it has been in a transition process based on market dynamics in both economical and social spheres. Reconstruction of neo-liberal politics has also been seen in health. Turkey restrained public expenditures because of the crisis that was resulted from the public social security system. Therefore the government has provided opportunities for private health institutions to become widespread. But this policy couldn't generate a solution. Increase of demands towards health services due to longer life expectancy and increase of health

service expenses complicated meeting demand. "Transformation in Health Program" has reconstructed health practices in framework of these problems with new government's accession to power since 2003. Although this program was encountered positively by large masses, it has generated new crisis fields due to new inequalities and negative circumstances especially for women, children and people from rural regions. Also it has an approach that positions patient as a "consumer". This approach and other approaches as general health insurance, performance based physician practises have negative effects especially on masses. This study examines the negative effects of these policies on people who has to "purchase" health service.

## **a03RN16 - Sociological Approaches on Organ Transplants**

Chair(s): Karen Lowton (King's College, London)

### **Considering Transbiology Narratives in Turkey via Nikolas Rose's Molecular Biopolitics**

**Nihan Bozok**, Middle East Technical University, Ankara | [nihanmortas@hotmail.com](mailto:nihanmortas@hotmail.com)

Since current medical configuration imagines the body as a collection of replaceable parts, the biological, natural and cultural borders of human body are needed to be reconsidered. Current medicine has a notable endeavour not only in curing disease and protecting health but also in enhancing the biological capacity of human being. For instance the body parts can be moved from individual to individual and bionic organs can also be produced in the laboratories. These are not merely technological triumphs of medicine. Rather, there occur new arts of governments and new technologies of self equipped with the understanding of molecular body. For investigating the collapse of monoblock body, one of the leading post-Foucauldian theoreticians Nikolas Rose offers the concept of molecular biopolitics. He underlines that since 1960's biotechnologies have developed

and the molecular knowledge of life has accumulated. Thus, there is a new kind of vitality rising upon the body whose components are storable, freezable, movable, replaceable and demountable. In this presentation I will consider the transbiology narratives in Turkey especially focusing on 2012 when the first face transplantation, first double leg and arm transplantation and many other organ transplantations experienced and made tremendous impact. I will discuss these narratives in the light of Rose's theory by considering the changes on individuals' relations with their bodies, individuals' economies of hope concerning health, conventional biological assumptions, and bioethics, caused by new biomedical model depending on the perception of fragmented and mobile vitality.

### **Mobilization of Transplant Patients' Associations in Switzerland: Tensions and Limits**

**Raphaël P Hammer**, University of Health Sciences | [raphael.hammer@hesav.ch](mailto:raphael.hammer@hesav.ch)

**François Kaech**, University of Health Sciences | [francois.kaech@hesav.ch](mailto:francois.kaech@hesav.ch)

As other European countries, Switzerland faces a crisis of transplantation, which results in an acute organ shortage. Over the last years, in the light of legal changes and intensification of public campaigns, organ donation has become an important social issue in Switzerland. Nevertheless, current public health policies are subject to criticism and debates. While activism of patients' associations has been widely examined in the case of various conditions, such as aids or

genetic diseases, little work has been conducted on the role played by patients' associations regarding organ donation. This communication deals with the issue of transplant patients' mobilization in Switzerland. It is part of an on-going research focussing on organ donation as a public problem, based on about forty semi-structured interviews carried out with members of several transplant associations. This communication will analyze how these associations are

involved in the public space, as well as their perceptions as to how the situation of organ donation could be improved. In particular, we will focus on the limits of their concrete mobilization and the obstacles they face to. Indeed, while most associations' discourses challenge public policies regarding organ donation, especially the neutrality of the State, it appears that their concrete actions address

the political level only to a very limited extent. This communication will also examine the lack of cooperation, if not conflicts, between these associations, despite their seemingly common goals. In conclusion, we will discuss the distinctive features of organ donation as a public good that might account for the ambivalent engagement of transplant patients' associations.

## **The Global-Local Nexus in Health-Related Crises: The Case of Organ Trafficking in the Israeli Context**

**Zvika Orr**, The Hebrew University of Jerusalem | [zvi.orr@mail.huji.ac.il](mailto:zvi.orr@mail.huji.ac.il)

Organ trafficking has typically been considered a global phenomenon, a prominent manifestation of the growing economic and health disparities between the global North and South, of the commercialization of health and the commodification of the human body. It has often been associated with neoliberalization, as well as with contemporary economic and social crises. At the same time, transnational organizations have played a pivotal role in attempts to prevent organ trafficking, relying on international and regional human rights norms banning this practice. However, this phenomenon is also affected by local, particular moralities, bodily perceptions, religious conceptions, and socio-cultural worldviews, which have frequently been overlooked. By exploring the case of purchase, sale and trafficking of organs in the Israeli context, this paper seeks to shed light

on the complex intersection of global and domestic forces shaping the public policies, practices, and discourses concerning this and other health-related issues. Based on multi-sited ethnographic fieldwork, this paper examines to what extent and how commerce in organs and the diverse responses to it are connected to broader global and local societal changes and crises, and how transnational ideas and perceptions regarding health and the human body are vernacularized in domestic settings. By analyzing the construction of the 'local moral worlds', the experiences and life stories of various stakeholders in Israel, this study illuminates the tensions and relations between global processes and international norms on the one hand, and the local Israeli practices and discourses concerning organ trafficking, on the other.

## **b03RN16 - Sociological Perspectives on Obesity I.: Interventions on the "Fat Bodies"**

Chair(s): Janina Kehr (University of Zurich)

### **Talking about Eating Disorders on YouTube: Five Italian Stories**

Arianna Radin, University of Torino | [arianna.radin@unito.it](mailto:arianna.radin@unito.it)

The web is a virtual place where you can find a lot of information and stories about eating well to stay healthy, produced by professionals, but also stories of ordinary people, especially women and often anonymously, in a blog or in a forum. On YouTube, the situation changes because the body becomes protagonist and the stories of people who suffer from eating disorders - anorexia, bulimia and obesity - have a value more important than the stories that are hidden behind the screen: protected from

the eyes of "others", people with eating disorders talk about their experiences, successes and failures, in the traditional way or more built, not always aware of being exposed to the user comments. This work is about a series of videos of five Italian women users who talked on the subject in a spontaneous manner, even in interaction with users of written comments, from April 2011. The focus is on their re-construction of the obesity dimension.

### **'Ladies' and 'Fat Bastards' Responding to the 'Big' Crisis: A Comparative, Ethnography of Single-Sex Weight-Loss Groups**

Oli Williams, University of Leicester | [osw1@le.ac.uk](mailto:osw1@le.ac.uk)

It is popularly accepted that Britain is in the midst of an obesity crisis that could push a strained National Health Service to breaking point. This 'big' crisis significantly informs ideas about what constitute 'healthy' and 'unhealthy' bodies. In this context of crisis, dominant neo-liberal ideas of individual moral responsibility frame obesity as a failure of civic duty and as such every 'body' can be considered to be under moral scrutiny. However, the response to this crisis is not uniform and much is to be gained from researching how different social groups engage with it. Traditionally, concern about physical appearance and weight has been considered a characteristically feminine preoccupation. Weight-loss groups are therefore commonly understood as sites for women to learn to modify and regulate their bodies. However, expanding concern about, and acceptance of, the necessity to 'maintain'

one's body has paved the way for men to enter this traditionally female domain, thus offering novel comparative research opportunities. Drawing on ten months of participant observation at a location where one male and two female single-sex weight-loss groups meet, this paper presents a comparative analysis of how gender shapes the approaches and practices of these groups. Gender identities are often constructed in opposition and as such comparing these groups enables revealing what is uniquely female or male in these settings. Therefore, particular attention is given to the 'private' nature of the women's weigh-ins compared to the more 'public' nature of the men's which reveals the groups' differing approaches to support where the men's jeering can be interpreted as in some way analogous to the women consoling each other.

## The Paradoxical Process of Standardization of the Bodies Underlying Global Health: A Praxiography of Obesity Surgery Y

Kàtia Lurbe i Puerto, ENS Lyon & AHP | [katia.lurbe.puerto@gmail.com](mailto:katia.lurbe.puerto@gmail.com)

This paper will present some preliminary results of a broader research on obesities, nutrition practices and bariatric surgery that is taking place at the Teaching Public Hospital Ambroise Paré (Boulogne, Parisian region, France). By taking the clinics of obesity-disease as case study and in particular, its surgical treatment, this paper seeks to bring to light the double logic of “social dys-structuring” and standardization of the bodies that operates at the core of what is known as ‘global health’. Indeed, the etiology of obesity-disease currently rests on a set of physical, psychic and social factors, the interaction of which seems very variable from a human being to another. Its diagnosis, being based on a simple and universalistic measure of body mass (BMI), is highly controversial not only from a sociological perspective, but also in the

view of most practitioners specialized in this field. First, a critical analysis will be presented on the mainstream public health discourse that describes obesity surgery as the last solution in situations of very severe and morbid obesity. I will pursue with a deconstruction of the admission pragmatics to obesity surgery. Finally, I will discuss the idea of obesity surgery being an intervention that standardizes the eating habits of the operated individuals, which can be easily drawn from most epidemiological studies on the efficiency of this surgery. This idea is a central one for sociologists as it leads to a core question for both the sociology of sciences and the politics of scientific production in health issues: are we really giving ourselves the means to study “global health” in its complexity?

## a04JS19JS16 - Professionals, Citizens and the Production of Health

Chair(s): Ruth McDonald (University of Nottingham)

### An Exploratory Study of Healthcare Professionals’ Views of Diabetes Self-Management and Structured Education

Josephine K W Go Jefferies, Nottingham University Business School | [lixjg21@nottingham.ac.uk](mailto:lixjg21@nottingham.ac.uk)

Chronic disease care in the UK accounts for 70 per cent of NHS budgets with demand forecast to increase (Coulter 2012). Health policy strategies aim to increase patients’ ability to self-manage (DH 2001) putting the onus of responsibility squarely on the shoulders of the unwell. Empowering patients will change their relationship with healthcare professionals (Anderson & Funnell 2005). By providing structured self-management education (SE) professionals are involved in managing that

change. NICE (2003) requires that SE is offered to all newly diagnosed diabetics. SE is: taught by qualified healthcare professionals; evidence and theory based; written down; quality assured/audited; and delivered in a group setting (NICE 2003). Views of diabetes self-management were explored in a study of diabetes specialist Educators delivering the X-PERT Programme. The view of professionals as self-interested, engaged in professional projects to increase status and resources for

their members is confirmed by the study, although this self-regarding view is nuanced by a concern about quality of care provided to patients. Auditable benefits to patients from SE depend on whether patients' personal self-management goals align with parameters of disease-control goals prioritised by certain clinicians. Delivering X-PERT empowers Educators to a) improve their own diabetes

knowledge, support and communication skills reinforcing expertise and effectiveness claims, and b) address poor quality diabetes care provided by more senior or distant colleagues, suggesting that SE can address poor professional practice by engaging patients as intermediaries, cutting across institutionalised specialisms which constrain their own professional effectiveness.

## Configuring the Patient through Complex Medication Schemes

**Attila Bruni**, University of Trento | [attila.bruni@unitn.it](mailto:attila.bruni@unitn.it)

**Claudio Coletta**, University of Trento | [claudio.coletta@unitn.it](mailto:claudio.coletta@unitn.it)

**Francesco Miele**, FBK - Fondazione Bruno Kessler, Trento | [francesco.miele1@gmail.com](mailto:francesco.miele1@gmail.com)

**Enrico M. Piras**, FBK - Fondazione Bruno Kessler, Trento | [piras@fbk.eu](mailto:piras@fbk.eu)

**Alberto Zanutto**, University of Trento | [alberto.zanutto@unitn.it](mailto:alberto.zanutto@unitn.it)

The increasing ageing rate of population and the development of ICT and Assistive technologies appear as relevant aspects in the re-organization of health care. This work provides an account of the visions and discourses around the theme of complex medication schemes for elderly people, emphasizing the ways in which they enact peculiar homecare infrastructures and networks and re-distribute medical knowledge and responsibility among experts and lay

actors. In fact, management of complex therapies represent an articulated social process where both patients, relatives, health care professionals and caregivers, as well as technological and medical device, are engaged. The paper is based on 8 focus groups with general practitioners of a north-italian province, conducted within the research project "AETAS - Active aging, Empowerment, TecnologiA, Salute".

## Patient, Citizen and Participant Involvement in Health Care: Trusting the Medical Profession?

**Mike Dent**, Staffordshire University | [mike.dent@staffs.ac.uk](mailto:mike.dent@staffs.ac.uk)

Whereas, much of the earlier discussions around patients' and citizens' involvement in health care and health care policy has been mainly around choice this is a very limited approach. Following the work of others (e.g. Fotaki et al 2006) I extend the discussion to include 'voice' and co-production (see Dent et al, 2011) as the three key components of user involvement in health care. The interrelations between these different aspects of 'user involvement' will be discussed in relation to the

issue of trust, especially in connection with doctor-patient relations. My rationale for this approach is threefold. First, the policy of 'patient choice', is not – or not solely – another name for consumerism within publicly financed health care, rather it is designed as a deliberative process intended to give 'voice' to patients/citizens (Hirschman 1970). This is a relatively new development and the paper will explore some of the implications for the medical profession, nor the health service.

Second, 'user involvement' has implications for trust relations within health care. On the one hand, 'responsibilisation' of users may lead to increasing questioning of trust. Conversely the same trend may lead to proto-professionalism (de Swaan 1988), characterised by an uncritical

trust of the health professionals. . Third, the categories 'choice', 'voice' and 'co-production' may also provide a construct for comparative research. This paper will draw on the work of the EU COST ACTION IS0903 User Voice Working Group

## **Implementing, Embedding and Integrating Practices: Can Normalisation Process Theory Explain Why Self-Management Support is Hard Work to Implement?**

Anne Kennedy, University of Southampton | [a.kennedy@soton.ac.uk](mailto:a.kennedy@soton.ac.uk)

Anne E. Rogers, University of Southampton | [a.e.rogers@soton.ac.uk](mailto:a.e.rogers@soton.ac.uk)

Ivaylo Vassilev, University of Manchester | [lvaylo.vassilev@manchester.ac.uk](mailto:lvaylo.vassilev@manchester.ac.uk)

Improving people's ability to self-manage is a cost-saving political aspiration. The interest of sociology in comprehending how practices become embedded in everyday life has relevance in understanding implementation of patient and clinical practices in health-care settings. This paper explores why an ostensibly "evidence-based" self-management intervention delivered in primary care failed to become normal practice. Normalisation Process Theory has utility for understanding the construction of agents' life worlds and how technological and material practices are made doable in clinical and other settings. NPT has four constructs: Coherence – sense-making work; Cognitive Participation – relational work; Collective Action – operational work; Reflexive monitoring – appraisal work (Sociology, 43:535-554(2009)). NPT provided a framework for the work of participants and how this contributed to material health practices

becoming normalised or not. We focussed on implementation of technology and tools – guidebooks for patients and using shared decision-making tools. Semi-structured interviews were conducted with 37 staff in 12 general practices. The analysis framework was based on the NPT constructs. Only guidebooks were embedded in daily practice; they enhanced patient-centredness and were minimally disruptive to existing work. Nurses were reluctant to engage with behaviour change discussions. Financially incentivised targets were practice priorities, self-management support was not: it was not auditable; not different enough to value; considered too disruptive; and there was minimal support within the practice. We evaluate NPT's merits as a sociological theory of implementation in comparison to other theories of diffusion.

## a04RN16 - End of Life

Chair(s): Anne E. Rogers (University of Southampton)

### The Crisis of Life-Prolonging Treatment after Severe Brain Injury: Family Experiences

Celia Kitzinger, University of York | [celia.kitzinger@york.ac.uk](mailto:celia.kitzinger@york.ac.uk)

Jenny Kitzinger, Cardiff University | [kitzingerj@cardiff.ac.uk](mailto:kitzingerj@cardiff.ac.uk)

Modern medical technologies and procedures - from resuscitation techniques to contemporary artificial ventilation and methods of delivering nutrition and hydration - can keep the human body alive almost indefinitely. This paper focuses on the use of life-sustaining technologies after people have suffered severe brain injury resulting in a disorder of consciousness. A European-wide survey of nearly two and a half thousand medical and paramedical professionals found that 82% would prefer not to be kept alive in a permanent vegetative state, and 70% would prefer not to be kept alive in a minimally conscious state (Demertzi et al, 2011) and yet the default option in the UK is continued

application of life-sustaining technologies. Withdrawal of treatment must be approved by a judge in the Court of Protection. Drawing on in-depth interviews with around 50 family members of severely brain injured people we show how the current medico-legal system results in many patients being maintained in (what their families view as) 'a fate worse than death'. The resulting 'health care crisis' has an enormous human as well as financial cost and is increasingly recognised as a major social problem for which there are currently no adequate solutions. We make practical suggestions for addressing this through medical, legal and social policy changes.

### Managing Complexity. Doctors' Perspectives on End-of-Life Decision Making and Care

Carlo Nardella, University of Padova | [carlo.nardella@gmail.com](mailto:carlo.nardella@gmail.com)

Physicians' decision-making and care for patients who are reaching the end of their lives have become increasingly complex and challenging. Multiple issues can be identified that increase the complexity of end-of-life situations: economic and organizational dynamics, changes in the doctor-patient relationship, patient and family expectations and pressures, medical-legal concerns, ethical implications. Managing these issues can be

difficult for physicians, who have a role to play with patients and their relatives, other physicians and medical staff as well as the legal system. The purpose of the present paper is to explore doctors' perceptions, feelings, ideas, and experiences regarding providing care and making critical decisions near the end of life through the use of narrative interviews with a sample of Italian hospital and family physicians.

## Dying Patient's Experiences: An Exploration of their Decaying and Deteriorating Bodies

Ana Patricia Hilario, University Institute of Lisbon | [patriciahilario@gmail.com](mailto:patriciahilario@gmail.com)

To date, research about the perceptions and experiences of those who are very ill and at the end of life has been limited. Few studies have explored the way in which the experience of a decaying and deteriorating body may influence how terminally ill patients see themselves and are seen by others. Thus, this study aims to provide a better understanding of the extent to which the sense of self and identity of terminally ill patients is affected by the process of bodily deterioration and decay prior impending death. The data was gathered by means of ethnographic research strategies. Participant observation was carried out during ten months in two Portuguese palliative care units for cancer and non-cancer patients. A

total of ten terminally ill patients were interviewed, along with twenty family members and twenty palliative care professionals. Findings reveal that just because someone is dying and as a result had suffered severe bodily losses it does not mean that they are no longer treated as a person. What clearly became evident in this study was that in the face of the bodily realities of dying the family dynamics and the palliative care environment were central to the maintenance of a patient's personhood. In sum, this study provides an alternative lens for making sense of the bodily realities of dying and in doing so it demonstrates how these realities may challenge a patient's personhood.

## b04RN16 - Sociological Perspectives on Obesity II.: Stigmatisation and Media Discourses on the "Fat Bodies"

Chair(s): Kàtia Lurbe i Puerto (Institut Français de l'Education + ENS Lyon & APHP, Oli Williams - University of Leicester)

## Saturated and Unsaturated Fats in the Finnish Media: Fat Wars in Helsingin Sanomat Newspaper, 1978–2011

Piia Jallinoja, National Consumer Research Centre, Helsinki | [piia.jallinoja@ncrc.fi](mailto:piia.jallinoja@ncrc.fi)

Mikko Jauho, National Consumer Research Centre, Helsinki | [mikko.jauho@ncrc.fi](mailto:mikko.jauho@ncrc.fi)

Johanna Mäkelä, University of Helsinki | [johanna.m.makela@helsinki.fi](mailto:johanna.m.makela@helsinki.fi)

The view that saturated fats are a major cause of cardiovascular diseases (CVDs) and that their consumption should be decreased has been dominant in Finnish media since the 1970s. Despite this dominance, the debate on health effects of fats has not settled. The presentation analyses the peaks in debates related to fats in foods in Finland. The data consists of articles related to the association of

fat consumption and CVDs, published in the largest subscription newspaper in Finland, Helsingin Sanomat, between 1978–2011. The study questions were: what triggers the rises of debate, who takes part in the debate and what are the arguments of the participants. There were a total of 689 articles that had the association of fats and CVDs as the main subject. In 1978, the association of saturated

fats and health risks was for the most parts established. We identified several peaks in the fat debates. In June 1988, a major dairy company, Valio, published an advertisement that seriously criticized the argument that saturated fats cause CVDs. A debate followed, lasting for several months. Thereafter, there were regular peaks in publishing articles and letters to the editor that gave rise debates over fats. E.g., in 1995 the debate meandered around the fat content of milk served at

schools. The most recent debates were related to low-carb diets. This debate peaked in autumn 2010 after a television documentary program (MOT) challenged the established message that consumption of unsaturated fats is a main determinant of CVDs. Throughout the period, the established canon of nutrition guidelines has been challenged, and different justifications for fat choices are presented by both professionals and other debaters.

## Neoliberal Gendered Bodies and Fatness

Hannele Harjunen, University of Jyväskylä | [hannele.harjunen@gmail.com](mailto:hannele.harjunen@gmail.com)

The body has been at the centre of intensive sociological and feminist inquiry at least since the 1980s. Social, political, and moral aspects of the body have been investigated. Especially, the Foucauldian disciplining side of the body has been in focus: how discourses and discursive practices produce normative bodies, how bodies are governed and how technologies of power produce gendered bodies and subjects. So far the economic dimension of the body has been rarely examined in social scientific and/or feminist research on the body. Yet, bodies are inevitably produced by the economic conditions and the approach that prevail. Neoliberal, capitalist model relies on a disembodied analysis of the social world; the

analysis relies on numbers, indexes, measures, figures, budgets, and profits. The materiality of the body and the experiences and the needs of the body are often ignored or deemed less important in analysis than “objective” measures. “Obesity” and “obese” bodies particularly have been in the focus of policies and sanctions that follow neoliberalistic reason. My objective here is to look into the production of the “neoliberal body” and how the neoliberal economic discourse and discursive practice work on the fat body. My aim is to generate knowledge on both the bodily experience of fatness and the social, political, cultural orders that shape, define, and govern said experiences.

## Stigmatization of Obese Individuals: Turkey-Iran Comparison

Ece Erbug, Hacettepe University | [ecee@hacettepe.edu.tr](mailto:ecee@hacettepe.edu.tr)

Hajaar Kebiri, Hacettepe University | [hacer.kebiri@gmail.com](mailto:hacer.kebiri@gmail.com)

Obesity is not only a health problem for a great percentage of the World population but also has become a social problem. Obese people themselves face with different kind of problems in daily life because of their bodies. From a sociological perspective, their fundamental problem appears to be ‘being stigmatized’. Based on Link and Phelan’s (2006) typology, there is; direct (e.g. being

verbally abused), indirect (e.g. being stared at public) and environmental (e.g. having difficulties in clothing) stigma. We also want to find out whether there are differences or similarities on stigmas based on culture. Our research, which is a comparative study between Turkey and Iran, aims to find out how the obese adults describe the stigmatization they are faced with. This is an ongoing

research and we are planning to complete our study at the end of June 2013.

## **Bodies that Are Controlled around “Health Discourses”: Experts’ Discourses Which Assure the Medicalization of Fatness and Biopolitics of Body**

Meral Timurturkan, Akdeniz University, Antalya | [meralgulkaya@gmail.com](mailto:meralgulkaya@gmail.com)

Body in our day changes into a project which carries the claim on perfectness and necessitates an intervention through commercial, political and social concerns. Constructing human-life with flawless procedures, controlling death, illness and health have become important issues, which occurs with the medical knowledge and the health discourse constituted by. There is a significant relationship between health discourses and usage of power as Foucault states; and medicine holds an essential place on politics and discipline strategies which are to be performed on bodies and population. The aim of the study is to discuss the relationship between potency and the power that comes in company with, within the context of the

medicalization of everyday life and furthermore it aims to analyze how our bodies are constructed into a system of controlling and commercial relations around health discourses in the context of medicalization of fatness. The study is based upon the analyses of columns by a specialist with power and popularity who writes regularly in a mainstream newspaper. All of his articles published in 2012 in the newspaper are analyzed with a discourse analysis method. In recent years, media’s emphasis on health and description of fundamental health-risk factors as an illness occur as a consequence of rising medicalization. In this process formed by media and health industry, doctors possess an important role.

## **05\_16JS28 - Gender, Health and Physical Activity (1)**

Chair(s): Ellen Annandale (University of York), Oliver Williams (University of Leicester)

## **Physical Activities in Medical Thermal Programs for Women: Between Health, Social Links and Rebuilding of Self-Image**

Amélie Coulbaut-Lazzarini, Université Versailles Saint Quentin en Yvelines | [a.coulbautlazzarini@gmail.com](mailto:a.coulbautlazzarini@gmail.com)

This communication aims to present a research project that must lead to the implementation in a thermal center of a program including physical activities for women having suffered of a breast cancer. Physical activities are seen in this program as a motor to restart social life and to improve quality of life of these women. It integrates the notion of social well-being in the definition of health. This communication will focus on the

first phase of the project which is about the state of the art and the recommendations to implement the program. This phase is important because it exists, on one side, theoretical elements on physical activities and health, and gender’s construction, and on the other side several thermal programs including empirically these elements without having studied it. So we propose here to study what is already existing through the light of theoretical

element about gender's construction, or more precisely here gender's reconstruction, socio-motor physical activities and health in a wide sense. Our study takes place in the French context. It includes programs led these last years in different French thermal centers that

implemented physical activities. It wants to show how these activities have an health and a social impact on women, when the French Health High Authority begins to recognize physical activities as a treatment.

## **A Gender Analysis of Weight Troubles: Ethical Implications of Eating Disorder and Obesity Prevention Practices.**

**Manuela Ferrari**, Centre for Addiction and Mental Health (CAMH), Toronto | [manuela.ferrari@utoronto.ca](mailto:manuela.ferrari@utoronto.ca)

Almost daily the media describe childhood obesity (OB) has one of the most serious public health challenges of the 21st century. At the same time, research reveals that that girls as young as 6 already express body dissatisfaction and that more adolescents suffer from disordered eating (ED). Although there is an overlap between the risk factors for ED and OB, prevention interventions continue to be conducted under two separate spheres of knowledge and practice. This generates inconsistency in the health messages delivered to the general public (e.g., OB interventions promote dieting to lose weight while ED prevention discourages dieting because it is identified to be a risk factor for ED). Through an analysis of the competitive discourses that emerge within the current ED and OB fields, this paper unpacks the gendered nature of ED and OB and practices that construct a healthy

and active body. Furthermore, ethical consequences of current gender-neutral prevention practice (e.g., healthy eating and active leaving). Data have been collected across Canada through interviews with 35 practitioners who work in either ED or OB (two in-depth interviews per practitioner), as well as through 6 focus groups and 12 in-depth interviews with 26 youths (aged 16–26) conducted as part of the Obesity and Disordered Eating in Youth (BODY) study. As the data analysis shows how there is disconnection between how healthy lifestyles are promoted by professionals (from both fields) and the contexts in which youth live their lives. For example, the impact that body-based harassment has on self-care, especially among girls and women, is a neglected area of prevention study. Implications for prevention, practice, and policy will be discussed.

## **Health, Body Shapes and Identities: A Study on the Moral Careers of Men and Women with Weight Problems**

**Cristina Calvi**, University of Eastern Piedmont | [cristina.calvi@sp.unipmn.it](mailto:cristina.calvi@sp.unipmn.it)

The presentation of the body became progressively a true presentation of the self (Goffman 2001). Through the development of technologies and techniques such as plastic surgery and diets, bodies not only becomes objects for the human "management" taking shape themselves as "real projects to be implemented" (Giddens 1991) with different

characteristics depending on the gender and age of the subjects, but assume a role increasingly central to the identity of everyone. This paper intends to present the results of an empirical study that involved people suffering from first degree obesity and that they had begun a medical course of treatment. In particular, the research aimed to reconstruct:

on the one hand, the practices and the meanings that influence the representations of states of health and disease for men and women; on the other hand, the moral career (Goffman 2001) of a ill person and a patient, that is the (re)construction of identity of subjects as ill person and as patient, with particular attention to aspects referring to changes in the self perception stemming from changes in the “form” of the body and in his “capacities”, and to gender differences. The research, referring to the theoretical paradigm

of the life course, adopted a qualitative research perspective. In particular, I realized 22 biographical interviews with patients identified analyzing their medical history and their personal data carried out directly on hospital records, focusing attention to variables such as gender and age. The analysis of data enabled me to identify representations of states of health and disease closely linked to the gender dimension and to the age of subjects and three models of paths of moral career for all respondents.

## **a05RN16 - Therapeutic Cultures: On the (De-)Pharmaceuticalisation Logics**

Chair(s): Ellen Annandale (University of York)

### **Medical Memory Work**

Katarina Jacobsson, Lund University | [katarina.jacobsson@soch.lu.se](mailto:katarina.jacobsson@soch.lu.se)

Medical staff spends a significant amount of time on reporting information not only to the next shift, but also to other occupational groups (nurses to doctors, nurses to assisting nurses etc.). Instead of treating these reporting instances as transfers of information, this paper tries out the concept of medical memory work: how medical staff interactively remembers who the patient is, what his or her problems are, previous decisions, and future

plans for the patient. Drawing on ethnographic field-notes from a cardiology clinic, the aim of this paper is to examine specific activities (e.g. oral reporting, taking notes) and artifacts (e.g. the patient board, medical record) as procedures and devices for shaping this memory. Considering “information report” in terms of memory work, brings its constructive, and normative features to the foreground.

## **The Depharmaceuticalisation of Sleep? Prescription Hypnotics in the News**

Jonathan Gabe, Royal Holloway, University of London | [j.gabe@rhul.ac.uk](mailto:j.gabe@rhul.ac.uk)

Simon Williams, University of Warwick | [S.J.Williams@warwick.ac.uk](mailto:S.J.Williams@warwick.ac.uk)

Catherine Coveney, University of Warwick | [C.M.Coveney@warwick.ac.uk](mailto:C.M.Coveney@warwick.ac.uk)

In this paper we revisit sociological questions concerning the pharmaceuticalisation and depharmaceuticalisation of life through an analysis of recent media coverage of hypnotics in the UK, stimulated by findings from a study

of mortality risks associated with these drugs. Particular attention will be paid to the accompanying published commentaries by sleep experts and reader responses and the associated frames of reference which were

invoked. These developments, we suggest, are part and parcel of long term efforts in the UK to exert downward pressure on the use of prescription hypnotics (vis-a-vis other non-pharmaceutical methods of sleep

management), which are perhaps best interpreted in terms of degrees of pharmaceuticalisation and depharmaceuticalisation over time, rather than either/or end-states.

## Informational Paths towards Performance-Enhancement Consumptions in Youth Therapeutic Cultures

**Telmo Clamote**, ISCTE-IUL, Lisbon | [telmoclamote@net.sapo.pt](mailto:telmoclamote@net.sapo.pt)

**Noémia M. Lopes**, ISTCTE-IUL, Lisbon | [noemia.lopes@iscte.pt](mailto:noemia.lopes@iscte.pt)

**Elsa Pegado**, ISCTE-IUL / Lusophone University of Humanities and Technologies, Lisbon | [elsa.pegado@iscte.pt](mailto:elsa.pegado@iscte.pt)

**Hélder Raposo**, ISCTE-IUL / Lisbon School of Health Technology (ESTeSL-IPL), Lisbon | [helder.raposo@gmail.com](mailto:helder.raposo@gmail.com)

**Carla Rodrigues**, University of Amsterdam / ISCTE - University Institute of Lisbon | [carla.af.rodrigues@gmail.com](mailto:carla.af.rodrigues@gmail.com)

While the role information sources play in therapeutic consumptions, particularly linked with new therapeutic categories or goals (such as that of performance, which problematizes the very notion of “therapeutic”), has received considerable attention in social sciences, its sociological understanding is in some ways still wanting, largely due to the atomistic approach of most studies, centering on isolated information sources deemed pivotal to the induction of new consumptions. While health infoscapes are changing, and with them certain consumption patterns, the very informational saturation to which new sources add implies that its effects are mediated by the articulations lay rationales must weave between different sources, old and new, in more complex and socially diverse ways. Focusing on performance-enhancement consumptions among youths – a poster-object

for hypodermic assumptions, in a population still coming of age to the management of its own health –therefore constitutes a good case study to discern if the centrality attributed to sources as the internet or sociability networks is warranted and, particularly, analytically sufficient. Assessing their roles in the interplay with broader infoscapes allows for a more thorough understanding of the transformations and continuities of the informational paths through which new generations are organizing their therapeutic trajectories, but also to assess the cultural pervasiveness of performance-enhancement in health infoscapes at large. This will be discussed through quantitative and qualitative data - resulting from the conduction of focus groups (n=58) and a national survey (n=1500) - from an ongoing research project on performance-enhancing consumptions in Portugal.

## Performance-Enhancement Consumptions: Avenues of Pharmaceuticalization in Youth Therapeutic Cultures

Noémia M. Lopes, ISTCTE-IUL, Lisbon | [noemia.lopes@iscte.pt](mailto:noemia.lopes@iscte.pt)

Telmo C. Clamote, ISCTE - IUL | [telmoclamote@net.sapo.pt](mailto:telmoclamote@net.sapo.pt)

Elsa Pegado, ISCTE-IUL / Lusophone University of Humanities and Technologies, Lisbon | [elsa.pegado@iscte.pt](mailto:elsa.pegado@iscte.pt)

Carla Rodrigues, Amsterdam Institute for Social Sciences Research | [carla.rodrigues@iscte.pt](mailto:carla.rodrigues@iscte.pt)

Hélder Raposo, ISCTE-IUL / Lisbon School of Health Technology (ESTeSL-IPL), Lisbon | [helder.raposo@gmail.com](mailto:helder.raposo@gmail.com)

Pharmaceuticalisation is a seminal topic in sociology of health. It conveys the current expansion of use of medicines, its dissociation from the strict field of disease, and the effect this process has in the production of new needs and new rationales of therapeutic consumption. The use of drugs to improve performance (cognitive, physical or social) - encompassing the so-called smart drugs and lifestyle drugs - is one of the dynamics that most reveal the extent of the social dissemination of the phenomenon of pharmaceuticalisation. The theoretical challenges raised by this phenomenon justify greater investment in research and the production of empirical evidence that, for now, is still scarce. This paper aims to explore some empirical results about the place of performance-enhancement consumptions within youth therapeutic practices and

cultures. The data stems from a national survey conducted in Portugal, with a sample ( $n = 1500$ ) of youths [18-29 years] both studying at university and without higher education. To explore the social heterogeneity within this process of pharmaceuticalisation, the analysis will focus on the following points: (i) differences and similarities between university students and other youths, regarding conceptions and practices related to performance - enhancement investments (ii) patterns of alternating consumption of pharmaceuticals and natural products, through which to explore pharmaceuticalisation trajectories. The notions of youth therapeutic cultures and performance-enhancement are the core categories deployed here to discuss some configurations of pharmaceuticalisation in today's societies.

## Mental Health Care Use and Psychotropic Drug Consumption among the Divorced: Does Informal Support Matter?

Veerle Buffel, Ghent University | [Veerle.Buffel@UGent.be](mailto:Veerle.Buffel@UGent.be)

Elieen Colman, Ghent University | [Elieen.Colman@UGent.be](mailto:Elieen.Colman@UGent.be)

Piet F. Bracke, Ghent University | [piet.bracke@ugent.be](mailto:piet.bracke@ugent.be)

The expenditures for mental health care and psychotropic drug consumption have risen in most West-European countries. In a post-divorce era, mental health problems and health care use have gained even more

importance. Divorce has detrimental implications for informal support networks. Informal support in turn influences professional care seeking. This study compares the health care use of the divorced

with that of the married. Within the theoretical framework of crowding in/out thesis, we question whether the availability of informal support, facilitates or substitutes formal care seeking. While the crowding-out thesis postulates that informal support substitutes formal support, the crowding-in thesis states that informal support encourages professional care use. We also wonder whether the relation between type of informal support and professional care seeking varies between women and men. The data of the Divorce in Flanders survey of 2009-2010 is used. Logistic regression analyses were performed separately for women (N=3450) and men (N=3020). We make a distinction between

contacting a GP, a psychiatrist, a psychologist and the use of psychotropic drugs. Informal support refers to the presence of emotional support of family and non-family members. Results show that divorced women (especially singles) contact more often each type of health care provider, regardless of their mental health, informal support and socio-economic background. Women who can rely on the support of family and non-family members are more inclined to contact a GP. With regard to men, informal support of non-family members positively influences each type of care seeking. These findings are in line with the crowding-in thesis.

## Lay Beliefs about Properties of over-the Counter Medicines

Ieva Salmane-Kulikovska, Riga Stradins University | [ieva.salmanekulikovska@gmail.com](mailto:ieva.salmanekulikovska@gmail.com)

Andrejs Ivanovs, Riga Stradins University | [andrejs@webresearch.lv](mailto:andrejs@webresearch.lv)

**Introduction.** It has been established by studies that lay beliefs and knowledge about properties, efficiency and necessity of medicines have impact on medicines' use patterns. The current paper studies statistically significant differences between lay beliefs and perceptions and medicines' use patterns in Latvia. The types of medicines within the context of this study are over-the-counter (OTC) medicines, including vitamins and food supplements. **Design.** Data from the nationally representative survey (n=785) in Latvia (2012), using a face-to-face interview technique, were analyzed using descriptive analysis and bivariate tests (Chi-square and Z-tests). To uncover the underlying deeper structure of a set of responses, Exploratory factor analysis method was used. **Results.** Four groups of views about efficiency, properties and necessity of OTC medicines were disclosed

–“erroneous perceptions”, “socially responsible”, “experience-based” and “the newer and the most expensive, the better” group. There were statistically significant differences disclosed in sociodemographic characteristics of these groups, such as place of residence and occupation. These opinion groups also marked statistically significant differences in respect to OTC use – the “erroneous perceptions” and “socially responsible” groups use OTC medicines more extensively than the “experience-based” group of opinions. **Conclusions.** The study has pointed out different motivational factors and ideas about properties of OTC that may be considered by information sources, such as pharmacists and GPs to ensure these perceptions are not in conflict with evidence-based practice.

## **b05RN16 - Agency/Empowerment in Healthcare**

Chair(s): Guido Giarelli (Magna Graecia" - Catanzaro)

### **Doing the Right Thing. Physicians' Communicative Strategies in Interacting with Internet-Informed Patients**

**Maria Caiata Zufferey**, University of Geneva | [M.CaiataZufferey@unige.ch](mailto:M.CaiataZufferey@unige.ch)

**Peter J Schulz**, Università della Svizzera Italiana | [peter.schulz@usi.ch](mailto:peter.schulz@usi.ch)

A growing number of patients use the Internet to search health-related information. However, the impact of this behaviour on doctor-patient relationship is still insufficiently understood. This paper aims at contributing to this topic by describing the strategies used by physicians to interact with Internet-informed patients, and by illustrating the motives underlying such strategies. We conducted semi-structured interviews with a sample of 16 physicians from primary care and medical specialist practices in the Italian-speaking part of Switzerland. Data collection and analysis were driven by grounded theory and were supported by a computer-assisted qualitative analysis program. The paper outlines a typology of four communication strategies used by physicians when facing Internet-informed patients: resistance to online information, repairing online information, co-construction around

online information, and enhancement of online information. The adoption of these strategies is shaped by physicians' general attitude towards Internet-informed patients, based on their conception of medical information for lay people through the Internet. However, this general attitude is mediated by doctors' interpretation of the specific communicative context, that is, their appraisal of three aspects: the patient's health literacy, the relevance of the online information to be discussed, and their own communicative efficacy. These results show that, when facing Internet-informed patients, physicians are involved in a complex process of interpretation of the communicative situation in order to decide how to behave. Knowledge gained from the analysis is discussed to identify implications for practice and research.

### **Compassion amidst Decivilising Processes? Emotions, their Sociogenesis and Some Implications for Health Policy**

**Ruben Flores**, National Research University - Higher School of Economics | [rdfloress@gmail.com](mailto:rdfloress@gmail.com)

**Patrick Brown**, University of Amsterdam | [p.r.brown@uva.nl](mailto:p.r.brown@uva.nl)

Recent conceptualisations of poor care and related suffering in the English National Health Service have led to government ministers calling for the incentivising of more compassionate care and the removal of apparent obstacles to compassionate practice within healthcare governance. This article examines the multi-layered and mutual

influence between the emotional practice of compassion on the one hand and healthcare and welfare institutions on the other. In particular we argue for an understanding of compassionate practice which is rooted in long-term and multi-dimensional configurations of social relations, therefore calling into question the possibility of neat

solutions such as using data-monitoring to identify care lapses or the incentivising of compassion through performance related remuneration. Healthcare governance frameworks and the relations and power dynamics they shape within care settings are just one element within a much more deeply rooted shaping of 'concerns' which shape

possibilities for emotional practices such as compassion. Drawing on Elias, Hochschild and related frameworks for considering the social construction of feeling, its internalisation and subsequent institutionalised practice, we discuss the implications of this historically rooted practice of compassion for the current NHS and the welfare state in general.

## **Patient's Self-Directed Agency: The Agency of Hospitalized Patient Contradicts an Agency Determined by Health Policy or Hospital Organization**

Riikka Lämsä, National Institute for Health and Welfare, Finland | [riikka.lamsa@thl.fi](mailto:riikka.lamsa@thl.fi)

In the Finnish agenda of national health policy, like in many western societies, a new type of patient is defined as active, participative and responsible for his/her own health, treatment and decision making. In this paper, I explore what kind of agency hospital ward practices afford for the hospitalized patient. I am interested in how patient's agency at grass roots level converges or contradicts the agency defined by policy level. The study is based on ethnographic fieldwork on three internal wards in southern Finland in 2006 and 2008. The study results show that in many hospital ward practices, like in a ward round or in the practice how sickrooms are distributed for patients, the patient is a passive object of the medical or caring intervention, and hence the agency of the hospitalized patient is far from

agency defined by the policy level agenda. However, in many practices and situations the patient is an active agent. The patients' modes of action can be called "active passivity" or "minimal agency", which in this context means that the patient's self-directed action in the ward is directed to familiar everyday life practices like "kicking around" or looking at "the box". On the whole, it seems that the patient's self-directed agency differs qualitatively from the agency, which policy level agendas or hospital practices afford for him. Thus, patient's active and participative agency could be effectively improved by enabling and supporting that kind of agency, such as the patient already has in the hospital ward.

## **"Dropping Back into the Pool": What Happens When Medics Stop Managing?**

Ellen Annandale, University of York | [ellen.annandale@york.ac.uk](mailto:ellen.annandale@york.ac.uk)

Olga Suhomlinova, University of Leicester | [os22@le.ac.uk](mailto:os22@le.ac.uk)

Nina Teasdale, University of Leicester | [nt91@le.ac.uk](mailto:nt91@le.ac.uk)

It far more common to research the power of physicians than it is their potential weakness. However in this paper we explore the vulnerability expressed by physicians recruited into managing their peers. We draw on in-depth interviews with six medical consultants in a range of specialisms drawn from a larger study of clinical and non-clinical managers in

two large English NHS hospitals (between 2010 and 2012). We found that they identify first and foremost as clinicians and view the managerial role as a time-consuming and difficult 'add on' to their clinical work. Nonetheless, they are motivated by the opportunity that management offers for developing clinical services. Significant challenges arise, however, from the

need to manage their peers in what is only a temporary role. Their identity as consultant-managers is 'suspended', hovering precariously over the 'pool' of their high status peers, into which they will eventually 'drop-back' in a purely clinical role. This makes managing difficult. They fear loss of credibility amongst their peers, some of whom feel that they have 'gone over to the dark side' (of management). The authority to sanction is hard

to come by when powerful peers asked to do things differently can say, 'well, make me'. In the paper we explore this expressed vulnerability and the strategies that managers employ to deal with it, such as espousing an organisation-wide vision and drawing on their wider management team (of general managers and senior nurses) to counterbalance the force of peer consultants in order to get their managerial work done.

## Dealing with Disease Where There Might Be No Disease: New Challenges for Contemporary Medicine and Health Care?

Giedre Baltrusaityte, Vytautas Magnus University | [g.baltrusaityte@smf.vdu.lt](mailto:g.baltrusaityte@smf.vdu.lt)

Modern medicine is based on the identification of biological parameters of disease, a clearly defined diagnosis and correspondent treatment. However, today medicine is facing a number of health disorders that fall out from this biomedical perspective. These disorders (e.g., fatigue, various pains, allergies of no clear origin) lack biological basis and therefore cannot be easily medically explained and treated. Therefore both doctors and patients have to deal with a situation where a disorder cannot be objectively identified and thus confirmed by a clear diagnosis. In medical and sociological literature such health conditions

are referred to as medically unexplained disorders (MUD). This phenomenon could be of interest to sociologists for at least three reasons: first, it pertains to the topic of social determinants of health; second, it is indicative of wider social changes, crises and conflicts taking place in contemporary society; third, it may challenge the biomedical model itself. The paper presentation will look at all these aspects of MUD phenomenon. It will be based on data from qualitative interviews with general practitioners and a survey of patients experiencing MUD in Lithuania.

## Between Empowerment and Reliability: Health Behaviours and the Use of the Internet

Micol Pizzolati, University of Molise | [micol.pizzolati@unimol.it](mailto:micol.pizzolati@unimol.it)

The article approaches the theme of changes and adaptations in health behaviours related to the use of the internet. The analysis of a selected literature confirms that topics as the seeking of information and the sharing of experiences through the internet represent fields of study that are emerging in the sociology of health and illness and allows identifying different hypotheses about the role of these practices on the transformations in health behaviours. The main aim of this paper

is to newly discuss some of these questions. The first perspective analyzed is inherent to the heterogeneous processes by which individuals construct the reliability of the online information and integrate it with the one received from traditional professional sources. The second issue refers to the actual opportunities that this practice offers in term of empowerment strengthening and of mutual help promotion. The analysis intends therefore to propose some reasoned responses to the

following questions: to what extent demographic and social differences determine the specificities by which the use of the

internet is embedded into individual's everyday experiences? Can these practices be effective in contrasting conditions of marginality?

## 06\_16JS28 - Gender, Health and Physical Activity (2)

Chair(s): Oliver Williams (University of Leicester), Ellen Annandale (University of York)

### Gendered Practices and Perceptions of the Sick Body. The Case of People Living with HIV in France

Laura Schuft, University of Nice Sophia Antipolis | [schuft@unice.fr](mailto:schuft@unice.fr)

Julie Thomas, University of Orléans | [juliethomas.professionnel@gmail.com](mailto:juliethomas.professionnel@gmail.com)

Estelle Duval, University of Montpellier | [duvalestelle@gmail.com](mailto:duvalestelle@gmail.com)

Based on field research (semi-structured interviews and participating observation) conducted in HIV-related associations and hospital groups in Nîmes, Montpellier and Nice, this paper deals with the discourse on fatigue and the practice and perceptions of physical activities of people living with HIV, according to gender and socioeconomic status. This work therefore broaches gendered practices and perceptions of the sick body in a context of twofold "crises": one of public health outreach promoting physical activity to fight sedentary lifestyles, and one of an HIV epidemic that requires long-term treatment to attenuate symptoms. Although the health communities in France now promote active lifestyles and physical activity for people living with HIV, such promotion is unevenly effective. As views and experiences of the body are

known to differ greatly by gender and socioeconomic status, the question addressed here concerns how the discourse on fatigue and the practice and perception of physical activity differ according to these social characteristics. Women lacking in socioeconomic autonomy and status have been found, for example, to be more fatigued and less physically active than other social categories living with HIV (Thomas et al., 2012). Yet it remains to be explored how these differing social categories and positions, as well as the various stereotypes with which they are linked, play a role in the social interactions and discourse – of people living with HIV in France – that shape perceptions of fatigue, physical activity and the "sick" body. Such perceptions, in turn, influence the practices that determine more or less active lifestyles.

### Lifestyles and Sports of Teenagers. A Case Study in Italy

Barbara Mazza, University of Sapienza, Rome | [barbara.mazza@uniroma1.it](mailto:barbara.mazza@uniroma1.it)

The World Health Organization (WHO) has issued over the past decade, an alarm on a number of risk factors that can influence negatively the life of a man: a sedentary lifestyle, improper eating habits, as well as the

use of smoking, drugs and alcohol not only affect adults, but in an even more significant and worrying about young people. Hence, it is necessary to intervene in order to improve people's health by changing their lifestyles. In

this regard, the ORSA (Regional Observatory sports Abruzzo) on behalf of CONI Abruzzo has conducted research in 2012 involving nearly 10,000 high school students (equivalent to 20% of the student population of the region) distribution by type of school attended, gender, age, province of residence, to ensure the representativeness of the sample. The survey examined by administering a semi-structured questionnaire and the construction of four focus groups (one in each province of the region), with the aim to investigate lifestyles,

eating habits and exercise habits, with particular attention to the profiles of obese and severely underweight teenagers, which together account for almost one third of the youth population. This is a first step in the knowledge base on which to take action to raise awareness and prevention with the help of all the Federations of the cones. The results have been demonstrated fully in line with the national data (Istat 2010) and made it possible to provide a detailed and multifaceted condition and habits of young Abruzzo.

## **The Body in Relation to Gender and “Healthy Citizenship”. A Comparative Analysis of Health Promotion Programs Implemented in Switzerland, France, Italy and Germany.**

**Monica Aceti**, University of Strasbourg; IUHMSP-CHUV Lausanne | [monica.aceti@unifr.ch](mailto:monica.aceti@unifr.ch)

**Sandrine Knobé**, Université de Strasbourg | [knobe@unistra.fr](mailto:knobe@unistra.fr)

**Simone Digennaro**, Università degli Studi di Cassino, Université de Strasbourg | [s.digennaro@unicas.it](mailto:s.digennaro@unicas.it)

**Gilles Vieille Marchiset**, Université de Strasbourg | [vieillemarchiset@unistra.fr](mailto:vieillemarchiset@unistra.fr)

Good health is an issue endorsed by a certain number of public policies along with actors of civil society and the corporate world. The analysis of the narratives (discourses, speeches, etc.) and images of national programs promoting health in Italy (Guadagnare salute), Switzerland (Poids corporel sain) and Germany (in Form), highlights specific national variations, as well as convergences, among which an ethos on «healthy citizenship» (Gilloz, 1984; Guenter, 2012; Radel, 2012). The citizen is required to be more and more responsible for his/her health, while paying attention to his/her social environment. This process of “healthicization” of society oscillates between individual private sphere and collective public sphere. It also goes with the will of interiorization of a personal

responsibility expressed by the actor on the basis of self-government. Within a sociological perspective, comparing countries, we want to identify: 1) how the process of taking charge of one’s health is described and prescribed; 2) who are actors mobilized- along the public/private axis- to support these lifestyle changes. Furthermore, within a gender perspective, we aim to comprehend whether the programs refer to elements of sexual differentiation based on traditional labour division and family roles. Or in other words, if they promote a gender-specific involvement regarding health which embraces a devolution of gender specific skills or within the realm of gender stereotypes (Vuille, Rey, Füssinger, Cresson, 2006).

## a06RN16 - Diseases Prevention Programs: The Case of Vaccination

Chair(s): Adam Burgess (University of Kent)

### The Crisis of Trust in Biomedical Knowledge - Forms of Parental Resistance to Childhood Immunizations

Jaroslava Hasmanova Marhankova, Charles University | [jmarhan@kss.zcu.cz](mailto:jmarhan@kss.zcu.cz)

Immunisation programs currently represent a firm and widely accepted part of biomedical health system. Czech Republic belongs among countries with mandatory immunization schedule strongly regulated by the state. To let children vaccinate is considered as an unquestionable norm supported by formal sanction for those who would not take part in such practice. This paper focuses on parents who challenge such norm with their decision to refuse their child's immunization. Twenty-two parents whose children were not vaccinated were interviewed and several participant observations were conducted at public lectures concerning immunization and on meetings of

parent who actively take part in the debates against compulsory vaccination. The paper analyzes the vaccine critical groups in the Czech Republic in the context of the crisis of trust in biomedical knowledge. It highlights the previous experience with health authorities and the feeling of lost of faith in trustworthiness of biomedicine as the key motives influencing the parents' decision to refuse the vaccination. It shows how the subjective attitudes to body and biomedicine affect the ways parents reflect upon vaccination as well as their conceptions of health and what it means to be a responsible parent.

### Socio-Cultural Aspects of Vaccination

Mateja Cernic, FUDS/SASS, Nova Gorica | [cernic.mateja@gmail.com](mailto:cernic.mateja@gmail.com)

Tea Golob, School of Advanced Social Studies, Nova Gorica | [tea.golob@fuds.si](mailto:tea.golob@fuds.si)

The paper tackles with the issues of vaccination in an early childhood that can reveal certain socio-political contexts, dominant discourses and attitudes in contemporary society. Medical, scientific and state institutions regard it not only as a beneficial and harmless measure, but often as a necessary, needed and justified measure, as "the greatest achievement of medicine", which should be implemented at population level. On the other hand, opinions of individuals greatly differ. While majority of people accept the official stance on vaccination, there are growing numbers of those who refuse it on the grounds of its injuriousness and ineffectiveness or because of their personal beliefs. The dominance of medical

professionals is thus contested, while parents have become more active in imposing their will by using media communication and social networks. In order to represent the contested relation between both pro- and anti-vaccine groups in the most comprehensive way, we explore the issue on two levels. The first level refers to discourse analysis of official documents and media communication (web sites, interviews, publications). The second level embraces the personal communication between paediatricians and parents, refusing vaccination, while drawing an insight from the in-depth interviews. The study demands the novel and innovative theories, as despite the controversy of the issue, its political, economic, cultural, and ideological aspects have been

seriously neglected by scientific community. The paper also touches on various ethical

issues of vaccination and broader medical practices.

## **Is the Crisis of Society also a Public Health Crisis? Lessons Learned from Vaccination Programs**

**Andrea Stockl**, University of East Anglia | [a.stockl@uea.ac.uk](mailto:a.stockl@uea.ac.uk)

**Claire Somerville**, Graduate Institute of International and Development Studies | [claire.somerville@graduateinstitute.ch](mailto:claire.somerville@graduateinstitute.ch)

Against the backdrop of the post-2015 global health agenda setting that has taken hold across the development industry, and the lobbying for a risk framework by world leaders in industry, governments and civil society at this year's Davos World Economic Forum, the stakeholders from the world of immunisation face some localized challenges. E.g. the 2012 "Shot at Life" campaign sought to engage Americans in advocating for vaccines in developing countries to give children "here" the same access to vaccines as the children "there". Simultaneously, health care professionals face resistance from parents to immunise their own children in industrialised countries. In the UK, questions over the safety of the MMR vaccine slowed vaccine uptake for years. More recently in Pakistan, tales of

conspiratorial contamination by the Western suppliers and state-backed power brokers in the immunisation field have led to the murder of immunisation workers. As the global actors frame the next 15 years post-millennium targets at macro level risk, some very different risk discourses are unfolding at the sub-global level. This paper explores the interplay between global health agenda setting and risk in contrast to some more local responses to perceived risk that are leading not only to the preventable deaths of under-5s but now also their health care givers. The current crisis in government seems to be played out on people's bodies and impacts on their lives. How did vaccines and their implementation become so political?

## **b06RN16 - Citizenship**

Chair(s): Ellen Kulhman (University Campus Suffolk, UK - University Siegen, Germany)

### **The Meeting between Citizen and the Health Care System - A Sociological Comparative Study of Participant's, Non Participant's and General Practitioner's Perceptions of Preventive Health Check-ups in the Municipality of Randers, Denmark**

**Sofie Ilsvard**, Aarhus University | [sofie.ilsvard@alm.au.dk](mailto:sofie.ilsvard@alm.au.dk)

For quite a long time health promotion has been high on the political agenda, and the incumbent government in Denmark wants to intensify the effort against health inequality by

initiating new health promotion programs. Meanwhile, a range of epidemiological studies point out the fact that health promotion programs are not dealing with a homogeneous

target group. These studies indicate the fact that participation in a health promotion program is less likely if a citizen has got few resources in condition to economy, level of education and employment. This holds the implication that a group of people are unintended systematically being excluded from health promotion programs. Therefore objectives of improving public health and reducing health inequality, seems difficult to accomplish from health promotion programs. Attempting to answer what actually do determine whether a citizen decides to participate in a health promotion program or not, I carry out a qualitative study in a Danish

municipality, in which all citizens aged between 30 and 49 years (approximately 26.000 persons) are invited to a preventive health check-up by their general practitioner. This paper is based on a pilot-study with citizens (participants and non-participants) and general practitioners (the ones inviting citizens to the health check-up), where I apply semi-structured interviews and qualitative vignette method to clarify the underlying reasons for the citizens' participation or not. In other words the objective of the study is to understand and explain the mechanisms involved in the meeting between the citizen and the health care system (the GP).

## **Fostering Inclusive Citizen Participation in Health: The Engagement of Minority Groups in Healthcare Governance**

Cláudia De Freitas, ISCTE-IUL, Lisbon | [claudia\\_defreitas@yahoo.com](mailto:claudia_defreitas@yahoo.com)

Migrants and ethnic minorities are amongst the least involved groups in European health participatory spaces. Reduced participation in healthcare governance puts minority groups in disadvantage compared to other vocal groups. Moreover, it risks deepening health disparities as diversity-blind reforms blamed on the economic crisis get implemented without their voices being heard. Despite this, little is known about how ethnic minorities can be successfully involved in healthcare. This poster examines the factors enabling the participation of Cape Verdean migrants in an advocacy project in Rotterdam, the Netherlands. It draws on a qualitative study entailing participant observation of a mental health advocacy project and semi-structured interviews with stakeholders in the field of user participation (n=30) and involved Cape Verdean users (n=14). The results reveal that Cape Verdeans'

participation in mental healthcare governance is determined by both demand- and supply-side factors. Demand-side factors comprise a broad range of motivations: users' desire to increase social interaction, acquire meaningful social roles, find work, overcome the stigma attached to mental illness, increase the responsiveness of mental healthcare and achieve greater social justice. Supply-side factors include direct mobilisation, capacity-building and empowering participatory initiatives. We conclude that fostering inclusive citizen participation in health requires a commitment by public health authorities and civil society organisations to work together in devising health participatory spaces capable of promoting the enablers of participation described above and of reaching out to disengaged minority groups.

## The Ambivalent Position of Stories in Service Users' Representational Work

**Tone Alm Andreassen**, Oslo and Akershus University College of Applied Science | [tone.almandreassen@hioa.no](mailto:tone.almandreassen@hioa.no)

Today's health and welfare policy not only encourage individuals with long term illnesses and disabilities to be more active on their own health, but also involve them in planning and evaluation of health and welfare services. Through legislation such involvement is integrated in the organizational structures and processes of service providing organizations. In consultative bodies and councils patients and clients are deemed knowledgeable to make sense of service users' experiences and produce authoritative forms of knowledge that can guide subsequent action from service providers, managers and boards. The citizens to be involved are those who have direct experiences of the issues under consideration, be it the illness, the mental health care, or the rehabilitation services. They bring to the councils their personal stories of encounters with health and welfare services, but as

participants in consultative processes they are supposed to represent in several meanings of the term – being typical, representative, a spokesperson – the group of service users. To be established as valid knowledge stories have to be embedded in appropriate discursive conventions, and these conventions are permeated by power privileging the views of some actors over others. This paper explores the ambivalent position of stories in the discursive conventions of service user involvement: how their personal stories construct the services users as legitimate representatives, but also undermine the authority of the spokesperson if being the perceived as a private story, and how, in times of austerity with emphasis on responsibilization, a mode of modesty is expected from storytellers.

## Lay Reinvention of Health as a Human Right: Towards the Reinforcement of Health as a Right by Social Participation and Legal Mobilization

**Élida L dos Santos**, University of Coimbra | [elidalauris@gmail.com](mailto:elidalauris@gmail.com)

**Alice Cruz Pereira**, University of Coimbra | [alicecruz5@gmail.com](mailto:alicecruz5@gmail.com)

The galloping conversion of the human body as a commodity, which is made manifest by the global pharmaceuticalization, combined with the increasing weakness of the welfare State in safeguarding social and economic rights within a conjuncture of recession, results in the mercantilization of health as a good and service of the State. By the one hand, this accentuates the cleavage between juridical and legal frames that presuppose the right to health, and an equitable access to medical care. By the other hand, the growing appropriation of biopower by individual and collective actors is producing new

intersections between the former, the State and biomedicine that produce a biosociality. This means that health as a right remains an important arena. Our work hypothesis is that the supremacy of the principle of the market in the field of health not only reinforces the swerve of the right to health as a human right (turned into a consensus during Alma Ata), but also that it depends on the politicization of health from below. In order to test our hypothesis, we will examine the social mobilization aimed at the reinforcement of the right to health through two main devices: participation and litigation. Our analytical focus

turns into the participation in the creation and accountability of public health policies, as well as in litigation of public interest in the reinforcement of consecrated constitutional rights but also in the creation of new juridical

frames, from the case study of Brazil in which democratization occurred alongside the emergence of a vernacular public health's paradigm that includes lay knowledge in the institutional production of health.

## **Changing Healthcare Practitioners' and Teachers' Views about Lesbian, Gay, Bisexual and Transgender (LGBT) Medical, Health and Social Care**

**Zowie Davy**, University of Lincoln | [zdavy@lincoln.ac.uk](mailto:zdavy@lincoln.ac.uk)

In the UK there is a crisis in the provision of healthcare for LGBT people. This is due, in part, by the lack of focused medical, health and social care curricula content about LGBT healthcare generally. Teaching has tended to position heterosexuality and gender normativity– people conforming to social standards of what is 'appropriate' feminine and masculine behavior– as the primary context in which health and illness is viewed. Models of health care that promote these views of sexuality and gender identity over others can create an environment in which gender stereotypes and heteronormativity– the cultural bias in favor of opposite-sex over same-sex sexual relationships – result in lesbian, gay, bisexual and transgender (LGBT) people becoming 'add ins', if and when they are considered. Even the term LGBT on the rare occasions it figures assumes that Ts have co-extensive healthcare issues as with the Ls, Gs,

and Bs, and can be taught together as an extension of the same theme. It is important to respond to the requirements of L, G, B, and T populations accessing health care with different models, not in the form of mainstream tolerance, but, I argue, by changing pedagogical institutions in lasting ways. However, education must not inadvertently pathologize LGBT communities by situating associated medical, health and social care curricula as purely LGBT issues, but must situate pedagogy within a health (in)equity framework that shows how health issues affect LGBT communities in complex ways (Davy & Siriwardena, 2012). As such, this research illustrates how we might overcome the barriers of providing LGBT curricula for medical, health, and social care students in a bid to help 'mainstream' LGBT people as health citizens.

## **a07RN16 - Reproductive Health in Crisis**

Chair(s): Jaroslava Hasmanova Marhankova (University of West Bohemia)

### **Assisted Reproduction in the Czech Republic: Setting the Limits of Reproduction**

**Lenka Slepickova**, Masaryk University | [lenka.slepickova@gmail.com](mailto:lenka.slepickova@gmail.com)

Barriers of what is and what is not normal in reproduction (and therefore desired, in the foucauldian sense), are not bound solely by the possibilities of reproductive medicine; they are

rather bound by legislation, public demand, ethical and religious norms and everyday praxis of infertility clinics. The "allowance" to be an infertility clinic patient and undergo

infertility treatment with the use of sophisticated medical technologies cannot be taken for granted as the reproduction, including medically assisted reproduction, is always stratified. Despite the liberal regulation of assisted reproduction in the Czech republic we can identify three factors that limit the access of patients to treatment of infertility: access to treatment only for hetero-sexual couples, the age limits for women and the financial cost of the treatment. However, doctors admit that their practices do not always correspond to the official limits, that their judgment of specific cases is individual,

and that they provide care even at the cost of violating official regulations. Drawing on data on the political debates concerning limits of assisted reproduction as well as on data from interviews with key actors (medical professionals and their patients), I will focus particularly on the following issues: how is nature and normality and desirability, in the context of assisted reproduction, discussed; what kinds of patients are defined as less appropriate candidates for infertility treatment and which norms and values anchor the decisions connected with the process of setting the rules for access to assisted reproduction.

## **Czech Birth Care System in Crisis? Views and Strategies of Clients Who Desire “Natural Childbirth”**

Ema Hresanova, University of West Bohemia | [ehresano@kss.zcu.cz](mailto:ehresano@kss.zcu.cz)

This paper focuses on crisis in the Czech birth care system perceived from the perspective of clients. In particular I focus on the perspective and practices of women who desire to give birth as “naturally” as possible. These women often see the roots of current crisis in the monopoly of obstetricians over providing birth care during labor and delivery, including spontaneous physiological cases, and seek services of private midwives. However, there have recently been passed strict legal restrictions regarding midwife competencies in cases of normal physiological birth in home settings, which some of these women choose in order to avoid too medicalized birth care. In this paper I explore various definitions of

„natural childbirth“, which these women hold. A number of studies suggest that “natural childbirth” may mean different things to different persons and can be defined in numerous ways. I ask what these women exactly want, what their ideas, expectations and knowledge of childbirth are, and where they gained them from. I am especially interested how these women perceive the current state of birth care in the Czech Republic, whether and how they actually deal with the “crises” in birth care services that they may perceive, and what strategies they have in order to fulfill their desires regarding birth care.

## **Assessing the Social Determinants of Teenage Pregnancy: A Time-Space Analysis Using an Obstetric Database from 1950-2010.**

Stephen J.T McCall, University of Aberdeen | [s.mccall.09@aberdeen.ac.uk](mailto:s.mccall.09@aberdeen.ac.uk)

Sohinee Bhattacharya, University of Aberdeen | [sohinee.bhattacharya@abdn.ac.uk](mailto:sohinee.bhattacharya@abdn.ac.uk)

Gary J Macfarlane, University of Aberdeen | [g.j.macfarlane@abdn.ac.uk](mailto:g.j.macfarlane@abdn.ac.uk)

Emmanuel Okpo, National Health Service (NHS) Grampian | [emmanuel.okpo@nhs.net](mailto:emmanuel.okpo@nhs.net)

Background: Teenage-pregnancy is highly associated with deprivation; the UK has

attempted quantified deprivation through socioeconomic measures. However, little research has compared the discriminating ability of these measures. Aim: To investigate the temporal-spatial patterns in teenage-conceptions in Aberdeen, United Kingdom and assess its association with different measures of socioeconomic status (SES). Methods: This was a population based study from 1950-2010, using registry based data from the Aberdeen Maternity Neonatal Databank, which collects data on pregnancies occurring in the Aberdeen Maternity Hospital. The main outcome variable was a conception age of less than twenty years. The measures that were used were the Scottish Index of Multiple Deprivation (SIMD), Carstairs Index, and Registrar General's Occupational based social class. Logistic regression models and receiver operating

characteristic (ROC) curves were used to measure the association between teenage-conceptions and the socioeconomic measures. Results: There was a decline in teenage-conceptions over the sixty year period. All the measures of SES were highly associated with teenage-pregnancy, given as Odd Ratios. The ROC curves showed that SES measures performed better than chance at determining teenage conceptions ( $\chi^2 = 158.7$ ,  $P < 0.0001$ ), they further showed that the SIMD performed best at predicting teenage-pregnancies, having the largest area under the curve with a value of 0.73. Conclusions: The SIMD is the most multifaceted measure of SES and this study has shown that the SIMD measure is the most suitable measure at determining teenage-conceptions, therefore, supporting its future use.

## The Use of Social Networks among Women with Fertility Problems

Eva García Piñera, Talent-us | [evagarcia@ua.es](mailto:evagarcia@ua.es)

Rodolfo Martínez Gras, University of Alicante | [rodolfo.martinez@ua.es](mailto:rodolfo.martinez@ua.es)

The medical process of fertilization in women means a period of major changes in their daily lives. Their role is vital in this process and they are bearing the heaviest burdens both physical and psychological, as well as economic. The fact that the medical process of assisted reproduction is a relatively new phenomenon, in most cases, generates important information needs to address concerns and questions that occur during the development process. At the same time, it is necessary for women to search people for mutual support, understanding and listening, in different stages of the medical process. In this sense, Social Network Sites –SNSs– in general and online social forums specializing in particular, have become complementary to traditional agents of support (family, friends, institutions). For this

reason, this research analyzes the uses of these virtual spaces and the main types of information and communication demands. It has been analyzed two main online social forums in Spain. The research technique is content analysis with a sample of more than four hundred messages concerning fertility issues posted on these forums from 1 February to 30 September 2012. Results show that patients undergoing fertility treatments and who choose to share their experience in forums specializing show an important need for emotional support, to share experiences with others who can empathize with them and who are in the same situation, as well as clarity and transparency of information received from professionals assisted reproduction.

## b08RN16 - Health, Diseases and Social Inequalities

Chair(s): Gunnar Reinbacher (Aalborg University)

### Tuberculosis - Socioeconomic Characteristics

Andrejs Ivanovs, Riga Stradins University | [andrejs@webresearch.lv](mailto:andrejs@webresearch.lv)

Ieva Salmane-Kulikovska, Riga Stradins University | [ieva.salmanekulikovska@gmail.com](mailto:ieva.salmanekulikovska@gmail.com)

Ludmila Viksna, Riga Stradins University | [ludmila.viksna@rsu.lv](mailto:ludmila.viksna@rsu.lv)

**Introduction.** Tuberculosis (TB) in Latvia has traditionally been associated with poverty, homelessness and malnutrition. Determinants, like HIV infection, smoking and drug or alcohol abuse have also been remarked. The aim of the present study is to compare socioeconomic characteristics of TB patients with general population. **Design.** The research was carried out from August, 2011 to December, 2012 in the Tuberculosis and Lung Disease Center of Latvia. The research questionnaire contained 196 questions about patients' income, health, unhealthy habits, daily nutrition, living conditions and employment. 304 completed questionnaires were included in the analysis. Obtained results were compared with the nationally representative FinBalt 2010 study. Chi-square test was used to evaluate

differences in the nominal research data. **Results.** The study detected several statistically significant differences: TB in Latvia is more widespread among men, the unemployed and inhabitants with lower income per one household member. TB patients are marked out by lower education level, poor living conditions, being single and often being HIV diagnosed. Excessive alcohol use (beer and strong alcohol), long-term smoking, drug use and being in prison are also typical for TB patients. Underweight is more prevalent for TB patients than overweight due to malnutrition. **Conclusions.** Comparing to the general population, socioeconomic status of TB patients is lower, and that needs to be addressed by TB control strategies.

### Gender Differences in Various Types of Mental Health Care Use Framed in Europe

Veerle Buffel, Ghent University | [Veerle.Buffel@Ugent.be](mailto:Veerle.Buffel@Ugent.be)

Piet F. Bracke, Ghent University | [piet.bracke@ugent.be](mailto:piet.bracke@ugent.be)

Sarah Van de Velde, Ghent University | [Sarah.VandeVelde@Ugent.be](mailto:Sarah.VandeVelde@Ugent.be)

The consumption of mental health care and psychotropic drugs is higher in women. Differences in need only explain a part of this gender gap. Additional explanations are often sought in gender role theories. Traditionally, women are expected to be more emotional and dependent and to have a higher willingness to adopt the sick-role. Contrastingly, characteristics of the stereotypical male

identity, like autonomy and emotional independence are associated with lowered help seeking behavior. Women are also more likely to be in lower socio-economic positions and primary health care use is more prevalent among the socio-economic deprived, while specialized care use is higher among the high educated and the wealthy. These gender roles and socio-economic inequalities might vary

across countries and can be differently related to mental health care use depending on the national health care system. Using a multilevel framework based on data of the Eurobarometer 248 (2005-2006), we examine the gender disparity in mental health care use (GP, psychiatrist, psychologist, psychotropic drugs, psychotherapy) in 29 European countries. We additionally analyze how need factors and socio-economic/demographic individual-level characteristics influence mental health care use and how they vary

cross-nationally and by gender. Preliminary results indicate substantial cross-national variation in the gender gap in mental health care utilization. Largest gender differences were found in Austria, Portugal and Greece, while no gender gap was found in Italy and Luxembourg. The gender difference was most pronounced in the use of psychotropic drugs and a GP, and much smaller in more specialized mental healthcare use, such as a psychiatrist.

## The Second Modernity of Plagues: The European Crisis and the Timeliness of Diseases of the Past

Janina Kehr, University of Zurich | [j.kehr@mhiz.uzh.ch](mailto:j.kehr@mhiz.uzh.ch)

In their 2011 annual report, Médecins du Monde (MdM) announced an imminent “sanitary crash” in France, which would render the living conditions of poor people unbearable. Their director stated: „In a context of crisis, whose effects are utterly felt by the precarious, health indicators are gravely deteriorating“. At the same time “long forgotten plagues”, as the German weekly journal *Die Zeit* once called tuberculosis (TB), are said to return to European cities, not least because of the cutback of social welfare systems, be it in poor suburban neighbourhoods of Berlin, Paris, or Athens. In my paper, I will examine the “second modernity” of diseases of the past like TB through the prism of the current crisis and their link to the renewed visibility of poverty in late liberal welfare states. I propose a shift in terminology from re-emergence to second

modernity of infectious diseases to grasp the historical continuities of unequal disease occurrence. Taking the concept of crisis in its double function as heuristical lens and historical fact, I will analyse on the one hand which diseases and aspects of inequalities become events again through the current crisis. On the other hand, I will critically interrogate what Craig Calhoun termed “the emergency imaginary” using the example of TB; a disease that has continuously existed in exactly the places where it is said to “return” with the crisis. Combining ethnographic material from fieldwork in TB control centres and charitable health centres in the French region Seine-Saint-Denis with theoretical works on modernity and crisis, I will thus show how “diseases without a future” gain a second modernity today.

## Homelessness, Social Vulnerabilities and the Risk of Somatic Illness

Lars Benjaminsen, SFI - The Danish National Centre for Social Research | [Lab@sfi.dk](mailto:Lab@sfi.dk)

The paper analyses patterns of somatic illness among homeless shelter users in Denmark and compares with the general population and other socially vulnerable groups. The analysis is based on individual administrative data for the entire Danish population including

approximately 26,000 users of homeless shelters over an 11-year period from 1999 to 2009 and includes data on mental illness, addiction and somatic illness. The analysis shows substantially higher prevalences of somatic illness among the homeless compared

to the general population on a wide range of diseases such as infectious diseases, skin diseases, lung diseases, blood diseases etc. To a wide extent the excess prevalence of somatic illness amongst the homeless is statistically explained by other vulnerability factors, especially drug and alcohol abuse. However, even controlling for substance addiction and a wide range of other individual characteristics

the prevalence of tuberculosis, hepatitis, HIV, lung diseases and skin diseases are significantly higher amongst the homeless. Especially the excess prevalence of tuberculosis, hepatitis, HIV, is substantially higher amongst homeless women even when controlling for other vulnerability factors and other individual characteristics.

## **a09RN16 - Health Promotion**

Chair(s): Lenka Slepickova (Masaryk University)

### **Learning Skills for Healthy Bodies and Healthy Lives: The School Health Policy through Political Discourse**

Brígida Riso, ISCTE - Lisbon University Institute | [brigida.riso@gmail.com](mailto:brigida.riso@gmail.com)

Although there is a small investment in health promotion and primary health care in Portugal we can observe a continuous development of school health policies addressing the requirements and orientations of the World Health Organization and European organisations. The political documents outline the school as an important place for learning health concepts and healthy practices, since childhood. This research seeks to know the dominant trends in management and political strategy regarding school health, considering the school as a social context where particular health policies take place. The aim was to provide some empirical evidence for understanding the ground and the scope of school health policies in Portugal. The governmental and political discourse

widespread by policy documents that shape the school health was the starting point for this analysis, thus the choice of a qualitative method and the selection of documental analysis as the technique for data collection. The importance of science, namely the medical expertise, in policies elaboration and the medical discourse about health risks were recognized as central pillars of the discourse on health promotion in school. In addition, the emphasis on individual responsibility for health as an act of true citizenship seems to be recognized through the individual ability to manage life skills in order to conquer a healthy body and a healthy lifestyle. These were the main elements that emerged from this sociological reflection around the school health policy in Portugal.

## Nudging: What are the Theoretical, Empirical, Political and Ethical Questions to Be Addressed to Answer to What Extent Nudging Is the Modern Way in Public Health?

Gunnar Scott Reinbacher, Aalborg University | [Scott@cgs.aau.dk](mailto:Scott@cgs.aau.dk)

Margrethe Nielsen, Metropolitan University College, Denmark | [marn@phmetropol.dk](mailto:marn@phmetropol.dk)

In the Danish debate about health improvement and policy during the last thirty years, the individualistic approach to citizens has been the overall attempt, but this has not shown effective. Therefore government, institutions as well as researchers are looking for another approach. Structuralistic approaches on society level could be seen as new and more effective ways to go. But it is complex and might only work in the very long run. Nudging as population and individualistic change in behaviour is a modern attempt to improve health for the population. By “nudging” people, step by step to increase smaller change in health behaviour, we could expect in the long run change on the societal level, but will it happen? This paper will look at some nudging projects, trying to find out on an

evaluation basis, whether and which improvement we can expect to find to answer the questions in this paper. We will address the cases on an empirical level and look at documentation and expected outcomes. The paper will also address nudging on a theoretical level, to look at the power and possibility for such a new concept in between individualistic and structuralistic approaches, based on sociological theory. Politicians might be very interested in nudging because of its expected effectiveness. When forcing to change people’s behaviour you also address the question of inequality. Using nudging, will it increase or decrease social inequality in society and what moral end ethical questions do we have to consider?

## The Imperative to “LIVE RIGHT NOW”: A Foucauldian and Neo-Marxian Analysis of the Canadian Broadcasting Corporation’s Healthy Living Initiative

Rebecca A Penn, University of Toronto | [rebecca.penn@utoronto.ca](mailto:rebecca.penn@utoronto.ca)

: In 2011, CBC launched “LIVE RIGHT NOW”, a national initiative with the goal of inspiring Canadians to “get healthy”. To what extent does this innocuous-sounding initiative conceal a hortatory injunction freighted with moral overtones? How does it reflect the current Canadian social, political, and economic context in which it is framed? Using the Foucauldian concepts of biopower and governmentality, I consider how each of the terms in the title embodies a neoliberal framing of health as an individual responsibility. Concerning the term “LIVE”, I look at the equation of ‘health’ with ‘life’, the role of the individual in neoliberal society, and

the types of subjectivities constituted through prevalent discourses on health. I examine the technologies of morality, the role of expert knowledges, and the constitution of citizens embedded in the call to “LIVE RIGHT”. Finally, the phrase “LIVE RIGHT NOW” demonstrates how this initiative is unique to this time in that it draws upon multiplatform technologies that allow for 24-hour access to a plethora of resources and experts. Woven into this Foucauldian analysis is a neo-Marxian perspective that suggests that this initiative works in the interests of capital coincidental to – or before – those of society.

## b09RN16 - Health Inequalities

Michael Marmot, University College, London | [m.marmot@ucl.ac.uk](mailto:m.marmot@ucl.ac.uk)

Martin Shipley, University College, London | [m.shipley@ucl.ac.uk](mailto:m.shipley@ucl.ac.uk)

Takashi Tatsuse, University of Toyama | [tatsuse@med.u-toyama.ac.jp](mailto:tatsuse@med.u-toyama.ac.jp)

Michikazu Sekine, University of Toyama | [sekine@med.u-toyama.ac.jp](mailto:sekine@med.u-toyama.ac.jp)

Health inequalities between social classes are universal, but the magnitude of these inequalities varies between countries. Little is known about changes over time in health inequalities in different countries. We followed up social class inequalities in health among employees from Finland, Britain and Japan. Cohorts from Finland (n=7332), Britain (n=5002) and Japan (n=3399) included employees 35-40 years at baseline (1997-2002) with a follow-up of 4-6 years. Social classes were managers, professionals and clerical employees. Poor physical health functioning was measured by the lowest quartile of the Short Form 36 (SF-36) physical component summary. The magnitude of health inequalities was measured by the Relative Index of Inequality (RII) and 95% confidence intervals (CI). Covariates were age, marital status, social relations, job strain and working overtime.

Class inequalities in health widened over the follow-up among men from Finland (adjusted RII at baseline 2.43, 95% CI 1.23-4.79, and at follow-up 3.56, 1.60-7.91) and Britain (RII at baseline 1.65, 1.14-2.40, and at follow-up 2.29, 1.40-3.73). Inequalities among women from Finland and Britain were smaller and they narrowed over the follow-up. The covariates had small effects on the inequalities. In Japan health inequalities could not be confirmed. In Britain and Finland health inequalities changed towards divergent directions: among men inequalities widened but among women they narrowed. Japan differed from the western countries as there were no health inequalities. Reasons for the gender and country divide warrant further scrutiny. Among Finnish and British men approaching their late work career efforts are needed to curb the unequal health development.

## Gender Dimension in Health Perception of Urban Poor: The Case of Ankara, Turkey

Yelda Ozen, Yildirim Beyazit University, Ankara | [yeldaozen73@yahoo.com](mailto:yeldaozen73@yahoo.com)

Medical sociologists have researched the sick role, illness behavior, health beliefs and the perspective on causation of illness more than five decades. Despite sociological interests on many facets of health and illness, the experiences of the poor seem to be neglected and the issue about their health experiences has been taken up in terms of health inequalities by displaying health status indicators. There are many researches, which investigated how people define health and illness especially by occupational classes and found different types of health constructs. How the poor conceptualize health and illness, which factors and experiences are influential in their perception, and different patterns of health perceptions among them have not much considered. In addition, how the poor women perceive, experience and seek health and cope

with limited access to health care they faced has not much been paid attention by sociologists, especially in Turkey. This study investigates gender dimension in health perception of urban poor living in gecekondu by considering poverty and illness experiences of poor families. In this framework, this study was conducted in poor gecekondu neighbourhoods in Ankara, Turkey via face to face interviews with 40 individuals, rural to urban migrants. It was founded that urban poors' perception of health is much influenced by the economic difficulties experienced, illness experiences, gender, and access to health care. The peculiar poverty experienced by women and cultural status in society differentiates both their daily life including coping with ill-health and the way to define health and illness.

## Economic Difficulties as Predictors of Disability Retirement

Ossi Rahkonen, University of Helsinki | [ossi.rahkonen@helsinki.fi](mailto:ossi.rahkonen@helsinki.fi)

Elina Mauramo, University of Helsinki | [elina.mauramo@helsinki.fi](mailto:elina.mauramo@helsinki.fi)

Eero Lahelma, University of Helsinki | [eero.lahelma@helsinki.fi](mailto:eero.lahelma@helsinki.fi)

Tea Lallukka, Finnish Institute of Occupational Health | [tea.lallukka@ttl.fi](mailto:tea.lallukka@ttl.fi)

**Background** Disability retirement is socioeconomically patterned. We widened the socioeconomic approach by examining whether current economic difficulties were associated with subsequent disability retirement due to all cause, mental disorders and musculoskeletal diseases. The contribution of other socioeconomic circumstances, physical and psychosocial working conditions as well as work-to-family interface on the associations was also examined. **Methods** Helsinki Health Study (2000-2002) mail survey data among 40-60 year old City of Helsinki employees were linked with register data on disability retirement and diagnoses (ICD-10) until the

end of 2010 from the Finnish Centre for Pensions. Cox regression analysis was used to calculate hazard ratios (HR) and their 95% confidence intervals (CI) for disability retirement. **Results** One fifth of women and men reported frequent economic difficulties. Frequent economic difficulties were associated with subsequent all-cause disability retirement among women (HR 1.85, 95% CI 1.50-2.28) and men (HR 2.45, 1.60-3.47). In addition, frequent economic difficulties were associated with disability retirement due to mental disorders (HR 2.54, 1.75-3.68) and musculoskeletal diseases (HR 1.80, 1.35-2.41). After adjusting for other socioeconomic circumstances and

work- and family-related factors the associations attenuated but remained. Conclusion Economic difficulties are associated with subsequent disability

retirement. Preventing disability retirement and reducing socioeconomic differences in disability retirement also economic difficulties among employees should be considered.

## Socioeconomic Inequities of Access to Health Care in Italy: A Longitudinal Analysis

Valeria P Glorioso, University of Milano-Bicocca | [valeria.glorioso@unimib.it](mailto:valeria.glorioso@unimib.it)

S V Subramanian, Harvard University | [svsubram@hsph.harvard.edu](mailto:svsubram@hsph.harvard.edu)

In this paper we analyze the relationship between socioeconomic status (SES) and access to health care services in Italy during the decade 1994-2005. When it was established in 1978, the Italian National Health Service was supported by a consensus that health care should be financed according to ability to pay but distributed according to need, thereby setting out equity objectives in terms of both financial contributions and access to care. However, as it has emerged from several exploratory analyses, in practice this goal is far from being completely achieved. Our analyses are based on data drawn from all the available editions - 1994, 1999/2000, and 2004/05 - of the Health Conditions and Health Care Utilization Survey, a large-scale repeated cross-sectional survey of a probability sample of the Italian population. Using multilevel logistic regression analysis, we estimate if and to what extent (a)

the opportunities of Italian citizens to access a given set of health services (general practitioners visits, specialist visits, outpatient diagnostic tests, and inpatient hospital care) are associated with their SES; and (b) the association between SES and access to health care varied between 1994 and 2005. Our analyses show that (a) a significant positive association between SES and the probability to access the selected health services exists - shaped differently for the indicators examined - among the study population; (b) both the pattern and the intensity of this association do not vary significantly over the period of interest. We conclude that some degree of socioeconomic inequity does characterize the realized access to health care in Italy. Moreover, this inequity has not changed significantly since 1994.

## How Is Early Childhood Adversity Related to Later Life Preventive Health Care Use? Mammography and Dental Check ups of Socially Mobile Individuals

Sarah Missinne, Ghent University | [sarah.missinne@ugent.be](mailto:sarah.missinne@ugent.be)

Stijn Daenekindt, Ghent University | [stijn.daenekindt@ugent.be](mailto:stijn.daenekindt@ugent.be)

Piet F. Bracke, Ghent University | [piet.bracke@ugent.be](mailto:piet.bracke@ugent.be)

Socio-economic inequalities in preventive health care use are well-established. However, little is known about the origins of the stratified character of these health-related practices. We try to gain insights into the underlying mechanisms by focusing on how inequalities accumulate over the life course. Recently, the

role of cultural capital and cultural health capital have been theoretically discussed, but more empirical testing is highly needed. A central question is the extent to which individuals have a capacity to act independently from the constraints and opportunities imposed by the social position of origin. This

dialectic of structure and agency will be empirically addressed by focusing on intergenerational social mobile individuals since they have been confronted with different contexts of socialization, each with its own economic capital, cultural capital and health-related practices. We study the use of mammography screening and regular dental check-ups. We use the Belgium sample of the Survey of Health Aging and Retirement (SHARE). For dental care both men and women (N = 3707) are studied, while for mammography screening only women are scrutinized (N = 1949). We operationalize social

mobility as occupation mobility using the ISCO-88 classification. By means of Diagonal Reference Models, we discern effects of the social position of origin, the social position of destination and social mobility itself. The results will be framed within the life-course perspective and cumulative inequality theory. In doing so, we try to shed light on the malleability of early-life structural disadvantages. Based on earlier empirical work, we expect long-lasting effect of childhood adversity on preventive health care use.

## a10RN16 - Health Behaviours

Chair(s): Ieva Salmane-Kulikovska (Riga Stradins University)

### Changes in Drinking Habits and Subsequent Sickness Absence

Aino Salonsalmi, University of Helsinki | [aino.salonsalmi@helsinki.fi](mailto:aino.salonsalmi@helsinki.fi)

Eero Lahelma, University of Helsinki | [eero.lahelma@helsinki.fi](mailto:eero.lahelma@helsinki.fi)

Ossi Rahkonen, University of Helsinki | [ossi.rahkonen@helsinki.fi](mailto:ossi.rahkonen@helsinki.fi)

Mikko Laaksonen, Finnish Centre for Pensions/ University of Helsinki | [mikko.laaksonen@etk.fi](mailto:mikko.laaksonen@etk.fi)

Introduction: Alcohol drinking has increased in Finland almost continuously during the past few decades. Adverse drinking is common also among employees. Drinking is associated with sickness absence but less is known about changes in drinking habits and their contribution to sickness absence. Methods: Weekly average, binge and problem drinking were measured by postal surveys in 2000-02 and in 2007 among the City of Helsinki employees aged 40-60 at baseline. Short, self-certified (1-3 days) and long, medically confirmed (3+ days) sickness absence spells were followed by means of the employer's register from 2007 to the end of 2010. The study includes 3356 women and 695 men. Poisson regression was used in the analyses. Results: Both new and stable (Heavy drinking:

Rate ratio= RR 1.53, 95% confidence interval=CI 1.20-1.94 for women/ Binge drinking: RR 1.39, CI 1.26-1.53 for women; RR 1.41, CI 1.09-1.83 for men/ Problem drinking: RR 1.41, CI 1.27-1.56 for women; RR 1.38, CI 1.02-1.87 for men) adverse drinking habits increased the rate of short sickness absence. Among women stable binge (RR 1.38, CI 1.21-1.58) and stable problem drinking (RR 1.21, CI 1.05-1.39) as well as increased average drinking were associated with long sickness absence. Previous adverse drinking habits were not otherwise associated with sickness absence but former problem drinking increased both short (RR 1.50, CI 1.20-2.22) and long (RR 1.77, CI 1.19-2.62) sickness absence among men. Conclusions: Stable adverse drinking habits increase both short

and long sickness absence. Adopting adverse drinking habits also increases short sickness absence. By decreasing adverse drinking

habits it might be possible to prevent sickness absence.

## The Structure of Factors Determining Health-Oriented Life-Style Formation

**Olga Paholok**, Institute of Sociology of National Academy of Sciences of Ukraine (ISNAS) | [paholokoo@gmail.com](mailto:paholokoo@gmail.com)

The article addresses the problem of health-oriented life-style formation in contemporary sociocultural space. The author notes that there is an apparent dissonance between the value of health as such and its practical implementation in the form of health-oriented life-style which, in turn, implies life-time adherence to caring for person's own health as well as daily production of health by its individual beholders. In so far as lifestyles are generated at the intersection of rational and irrational, consistent and spontaneous, conscious and unconscious, the attempt of revealing the general structure of factors determining health-oriented life-style formation is being undertaken. The proposed point of view suggests that the stable health

orientation taken as a core for individual's lifestyle is the result of complex interplay between factors of multiple levels. Namely, these factors can be brought together to the general scheme consisting of three components which are: habitus, embodiment and strong-willed personality. Thus, health-oriented life-style formation is recognized as a willed endeavor, which is a personal choice, though made within a set of socio-cultural framework (habitus determination) and under consideration of specific psychological and corporeal features (embodiment determination). The author claims that the suggested scheme can be used for further empirical research of health-orientation within individual life-style structure.

## Behavioral Strategies of Patients with Medically Unexplained Symptoms in the Lithuanian Health-Care System

**Vylius Leonavicius**, Vytautas Magnus university | [v.leonavicius@smf.vdu.lt](mailto:v.leonavicius@smf.vdu.lt)

The presentation discusses research on medically unexplained symptoms (MUS) – an increasingly proliferating phenomenon in contemporary health care systems. It is argued in sociological and medical literature, that, according to different criteria, MUS comprise from 20% to 60% of all illnesses (Nettleton 2003; Wileman 2002; Ring et al. 2005; Ring et al. 2004; Asmundson 2001). Sociologically an illness is experienced and expressed through a person's interaction with her/his environment. In case of MUS, a person has not only to cope with long-term symptoms that cause distress but also to explain and prove to other people that her/his illness is real. The research conducted in Lithuania allows us to assume

that the withdrawal of a person experiencing MUS from her/his social obligations are not always justified by surrounding people and that this person may encounter other people's negative reaction; Even if medics confirm that an illness experienced by a person is not serious and it does not need medical treatment, this person may attempt to seek for diagnosis (i. e. to become a rightfully ill person) in order to preserve her/his social position, to repair her/his social connections and secure support. In other words, in case of MUS, a search for medical diagnosis (and at the same time the patient's behavior with regard to health care system) may be related to her/his desire not only to resolve a troubling health

problem but also to justify her/his aberrant social behavior and give a meaning to her/his illness. The research on the behavior and well-being of patients with MUS in the Lithuanian

health care system is based on semi-structured interviews. In order to cope with MUS, patients choose different strategies.

## Minimum Prices of Alcohol and Alcohol-Related Mortality by Education: A Time-Series Analysis

Kimmo Herttua, University of Helsinki | [kimmo.herttua@helsinki.fi](mailto:kimmo.herttua@helsinki.fi)

Pricing of alcohol has been regarded as an effective tool in reducing alcohol-related harm, and minimum price of alcohol is one of the proposed set of alcohol policies in the UK and elsewhere. However research on the association between minimum prices and alcohol-related harm is scarce or non-existent. Furthermore, no research exists how this association varies across different socioeconomic groups. We estimated effects of minimum price of alcohol on alcohol-related mortality according to education. Time series analysis modeling was applied to the quarter-annually aggregations of deaths and minimum prices of alcohol in Finland for the period 1988-2007 to assess the association between minimum prices of alcohol and alcohol-related mortality. Alcohol-related mortality was defined using information on both underlying

and contributory causes of death. We used data on minimum prices for different alcoholic beverages including spirits, intermediate products and wine. Analyses were carried out for men and women aged 25-79 years in four educational categories based on the highest level of education achieved. Expected results and their significance. Finland and also some other Nordic countries are particularly favourable targets for this kind of studies because of their monopoly systems in retail sale of alcohol. To our knowledge, this the first large-scale population-based study on the association between minimum prices of alcohol and alcohol-related mortality, and socioeconomic disparities in this association. Results will have both scientific and practical significance for improving public health.

## Japan's Individualized 'Safety Blanket' of Surgical Flu Mask Wearing

Adam Burgess, University of Kent | [a.burgess@kent.ac.uk](mailto:a.burgess@kent.ac.uk)

This presentation begins to develop understanding of surgical mask wearing in Japan, now a routine practice against a range of health threats. Their usage and associated meanings are explored through surveys conducted in Tokyo, with both mask wearers and non mask wearers. It contests commonly held cultural views of the practice as a fixed and distinctively Japanese collective courtesy to others. Historical analysis suggests an originally collective, targeted and science-based response to public health threat has dispersed into a generalised practice lacking

clear end or purpose. Developed as part of the biomedical response to the Spanish flu of 1919, the practice resonated with folk assumption as a barrier between 'purity' and 'pollution'. But mask wearing only became socially embedded as a general protective practice from the 1990s through a combination of commercial, corporate and political pressures that responsibilized individual health protection. Mask wearing is only one form of a wider culture of risk; a self protective 'risk ritual' rather than collective, selfless practice.

## 16JS31JS35 - On Disadvantaged Populations within Health Care Systems in Contemporary Europe: The Case of Migrants and Ethnic Minorities

Chair(s): Kàtia Lurbe i Puerto (ENS Lyon), Anders Petersen (Aalborg University Denmark)

### Health Inequalities in Accessing Health Care for Ethnic Minority Women: Regulative Contexts and Services in Comparative Perspective

Genova Angela, University of Urbino | [angela.genova@uniurb.it](mailto:angela.genova@uniurb.it)

Ethnic minority women present higher risk of health inequalities. The aim of this study is to investigate the impact of the crises on the regulative contexts and the related services to tackle health inequalities for ethnic minority women in accessing health services in four EU countries. The study presents the results of EC co-funded project: Better Health for Better Integration, focusing on the regions of South West England in UK, Marche region in Italy, the county of Orebro in Sweden and the state of Romania. Analyses show that in Marche region there is a fragmented and incomplete regional regulation and few targeted services implemented, despite the high level of guarantee in accessing health services for migrant population claimed by the national law. In Orebro county, equal access and

treatment of all residents are emphasized and some prevention targeted services were recently introduced. In South West England, the universalistic health system guarantees high level of access to health services however the recent reform process has introduced copayment for some basic health services. In Romania, the occupational health care system limits access to health care for not insured and no reform has introduced to improve the contexts. The current economic recession has different impact on the regulative contexts and related services in the four geographical areas analyzed: in Orebro has increased the attention for efficacy and efficiency, while in Marche and Romania the institutional inertia risks to amplify the inequalities as well as the payment system in South West England.

### Beyond the Usual Suspects: Increasing the Representation of Disadvantaged Minorities in Health Participatory Spaces in Times of Crisis

Cláudia De Freitas, ISCTE-IUL, Lisbon | [claudia\\_defreitas@yahoo.com](mailto:claudia_defreitas@yahoo.com)

Cuts on healthcare budgets and the increasing disinvestment in diversity sensitive care observed since the start of the economic crisis in Europe are likely to generate civil disobedience and impel service users to seek a voice in healthcare governance. Many EU countries have created health participatory spaces where citizens can join government representatives to discuss healthcare policy and delivery. This development is grounded on the idea that listening to users can help develop more responsive health policies and services. However, the citizens involved in

these spaces are usually white middle-class people who are not necessarily sensitive to the needs of less vocal, disadvantaged groups. This may cause health participatory governance to become a mechanism by which health inequities are produced or exacerbated (instead of reduced) as services become progressively adapted to the needs of better-off majorities. Increasing the representativeness of health participatory spaces beyond the “usual suspects” is crucial at a time when reforms associated with the economic crisis are threatening the loss of

many healthcare rights. This paper looks at strategies that can promote the participation of disadvantaged groups. It draws on a qualitative study of user involvement in mental healthcare in the Netherlands employing participant observation and semi-structured interviews with Cape Verdean migrants affected by

psychosocial problems (n=20) and stakeholders in the field of user involvement (n=30). We conclude that both governments and civil society organisations need to adopt a proactive approach to user participation in order to make health participatory spaces more inclusive and promote equitable change.

## **Labor Migrants to Russia from CIS: Medical Social Control versus Health Care.**

Violetta M Khabibulina, St. Petersburg State Medical University | [vioksu@gmail.com](mailto:vioksu@gmail.com)

Medicalization of labor migration leads to intervention of hegemonic discourse of power into medical issues. This paper attempts to analyze President Putin's Migration Policy's concept (13'June 2012), recent relevant legislation (2002-Jan'2013), and practical implications in Kazan and St.Petersburg with main focus on medical exams for foreigners to receive work permit and on consequent deportation if dangerous diseases are revealed. Although there is a declarative sentence about non-discriminatory ideology of new Migration Policy, the adequate access to the health care settings is not clarified. We consider that the main feature of Russian political decisions towards labor migrants is to establish strict medical social control over process of a work permit issue and/or to create additional source for state budget or latent corruption. And this tendency is not

related to public health control and preventive preparedness. Arguments based on discourse analysis, observations, and on health&migration statistics data allow to reveal the discriminative nature of legislation and to present new model of 'doctor-patient interaction' where the doctor is a medical policeman rather than a healer. If medical exams are set up in order to prevent the infected or narcotized body from crossing the Russian border, so there are several discrepancies: i) not all labor migrants from CIS are subject to medical testing, it's not true for family members and illegal workers; ii) the screening itself can be postponed for a several months; iii) biomedical justification is not enough in a case of friendly regulations towards bodies from certain countries and social strata. So the main public sociology conclusion is to cancel the medical testing.

## **Living with Chronic Disease – Minority Experience**

Kadi Lubi, University of Tartu | [kadi.lubi@ut.ee](mailto:kadi.lubi@ut.ee)

Triin Vihalemm, University of Tartu | [triin.vihalemm@ut.ee](mailto:triin.vihalemm@ut.ee)

This paper contributes to the research of the area that is especially vulnerable to the cuts in welfare provision and tense situation in the labor market due to the economic crisis in Europe – the possibilities of social rehabilitation of chronically ill people who are (partially) capable and willing to continue working and participating in the society life. We ask what are the prospects of ethnic minority

members in realizing this vital desire under the double pressure: the need to cope with disease and with the tensions arising from overall economic and social depression from the other side? The analysis bases on the survey and in-depth interviews with younger Parkinson disease patients in Estonia. Informants were ethnic Russians with various levels of knowledge of Estonian language, educational

and occupational backgrounds. We approach our data from the practice theory perspective (Schatzki 1996, Reckwitz 2002, Shove et al 2012) that is novel in the health sociological research. We outline the practices of becoming re-tooled and re-skilled to maintain their social position despite of diminishing physical capabilities. In broad terms our analysis showed that on the everyday practical level people have re-tooled and re-skilled and position themselves as competent

practitioners, less so when managing with the public discourse of the sick (minority) people that discourages their social rehabilitation. Finally we discuss the possibilities to mitigate the drawbacks rising from the strained relations between social groups in time of socio-economic depression as well as the methodological challenges of using practice theoretical approach in the research of health and ethnicity.

## **16JS31JS35 - On Disadvantaged Populations within Health Care Systems in Contemporary Europe: The Case of Migrants and Ethnic Minorities**

## RN16 - Poster Session

### Direct-to-Consumer Advertising: Obstacles for the Aging Population in Association with Health Literacy and Cognitive Age

Janelle Applequist, The Pennsylvania State University | [jra5032@gmail.com](mailto:jra5032@gmail.com)

The average television viewer can expect to spend 16 hours of their life this year alone viewing prescription drug advertisements on television [Sagar & Socolar, 2003]. This statistic merits research attention for every population, but the aging population is a body that requires immediate recognition. Many stereotypes exist surrounding the aging

population, and often times, this group is labeled as having a significant and rapid decline in cognitive ability with increases in age. While certain medical conditions, such as dementia, may intensify the process of cognitive decline, research actually suggests that the overall stereotypes surrounding the aging population's cognitive functioning are

misguided and incorrect. One may assume that pharmaceutical advertisers also believe the stereotype that the cognitive processing of aging individuals is declining, but this is simply not the case. Often times, pharmaceutical ads take the fact that aging individuals have cognitive abilities that are strong overall and use this while constructing their broadcast commercials for drugs. This paper will show how cognitive age is commonly used for the development of DTC advertisements. Cognitive age is a form of self-concept and includes the

ways individuals perceive themselves. Studies have consistently shown that aging adults view themselves as being much younger spiritually, socially, and emotionally in comparison with their actual age. In adults aged 60 and older, 60-75% report feeling younger than their chronological ages, and over 50% feel at least 17 years younger than they actually are (Stephens, 1991). This information becomes extremely relevant when looking at the construction of DTC advertisements themselves.

## RN17 - Work, Employment and Industrial Relations

### a01RN17 - Trends and Effects of Collective Bargaining

Chair(s): Jim Arrowsmith (Massey University)

#### Collective Bargaining and Sector-Specific Concertation in Italy

Alessia Vatta, University of Trieste | [VattaA@sp.units.it](mailto:VattaA@sp.units.it)

After the 2011 national agreement between the Italian social partners' main confederations, decentralised collective bargaining has been further encouraged. However, while the importance of collective bargaining is increasingly called into question, the related bilateral and trilateral forms of sector-specific concertation remain part of the agreements. They are devoted to various purposes (e. g. vocational training, equal opportunities and

labour market issues) and are often managed jointly by social partners' organisations through sectoral bodies or consultations. In comparison with peak-level social pacts, it is a less visible kind of concertation; nevertheless, it is still relevant especially in times of crisis. The paper intends to deal with this elusive topic and, if possible, draw some comparative considerations.

#### European Industrial Relations and Social Dialogue: From Factors to Actors

Bernd Brandl, University of York | [bernd.brandl@york.ac.uk](mailto:bernd.brandl@york.ac.uk)

Previous research has highlighted and described the complexity of transnationalisation of industrial relations in Europe. The reason for the complexity is the existence of multiple actors on different levels with different institutional characteristics, and with horizontal and vertical relationships and interdependencies. This complexity makes it hard to identify general patterns for the functioning of a transnational social dialogue and for the efficacy of transnational institutions. On the basis of an 'agent-based' approach, this paper develops an approach that models industrial relations in Europe as interactions among adaptive actors, who

influence one another in response to how they are influenced. With this approach, transnational patterns on a macro level are explained not simply by an aggregation of activities of multiple actors, but with a bottom up dynamic model on the micro-level. The paper shows how transnational phenomena on the macro-level in the field of industrial relations, such as transnational agreements between social partners and the (non-)efficacy of transnational institutions, can be described, modelled and explained by a general set of behavioural assumptions on the micro, i.e. the actor, level.

## Silent Marginalization? Concession Bargaining and Trade Unions in the Irish Recession

**Bill Roche**, University College, Dublin | [Bill.Roche@ucd.ie](mailto:Bill.Roche@ucd.ie)

**Paul Teague**, Queen's University, Belfast | [p.teague@qub.ac.uk](mailto:p.teague@qub.ac.uk)

During periods of deep and persisting recession, concession bargaining between unions and employers has been a common feature of employment relations. Three types of concession bargaining are identified in the international literature: integrative concession bargaining, ultra concession bargaining and restricted concession bargaining. Each has different sets of antecedents and different effects on union power and influence. Drawing

on a survey and on focus groups of HR managers and union officials, the paper examines the conduct of concession bargaining in Ireland during the Great Recession. It finds that unions have been able to exert little influence on the substantive concessions, agendas and procedural changes sought by employers. The consequences of the prevalent form of restrictive concession bargaining for unions are discussed.

## Collective Bargaining in Portugal: Dynamic Research and Empirical Results

**Paulo Jorge Martins Fernandes**, Polytechnic Institute of Setubal | [paulo.fernandes@esce.ips.pt](mailto:paulo.fernandes@esce.ips.pt)

From the conduct of this research work was intended to examine and reconstruct the processes of collective bargaining in Portugal, as well as changes that have occurred over the past few years - due to the changes that have happened in terms of professional relationships - which seem to reflect the changes occurring in terms of weight that some sectors have gained. Search also verify if the business models adopted have influenced the results or strategies that mobilize actors end up being more decisive than these models for content resulting from the negotiation. Collective bargaining as empirical object has a set of dimensions associated with him and that were analyzed throughout this investigation. Firstly we consider the regulatory role that has since established a set of rules and principles for certain professional groups or sectors. The

interview was one of the instruments used to collect information to support and realize the deeper aspects, and the target in this case were the key actors who play the central role in these processes and that sometimes may not be present or actors who have been present in particular situations during these processes, where the need for negotiation or process characteristics of the negotiators themselves have justified. The sectors that have served the purpose of this investigation were determined using three criteria: the contribution of each sector in total employment, the sector's exposure to international competition (competitive sectors, sectors sensitive) and organizational and technological modernization that these sectors have conducted or are conducting

## b01RN17 - Employment Relations at the Workplace

Chair(s): Jim Arrowsmith (Massey University)

### Multinational Enterprises and Industrial Relations: Multinationals and Domestic Firms Compared

Maarten Van Klaveren, University of Amsterdam | [m.vanklaveren@uva.nl](mailto:m.vanklaveren@uva.nl)

Maarten Van Klaveren, University of Amsterdam | [k.g.tijdens@uva.nl](mailto:k.g.tijdens@uva.nl)

Denis Gregory, Ruskin College, Oxford | [dgregory@ruskin.ac.uk](mailto:dgregory@ruskin.ac.uk)

This paper aims to present outcomes of continuing research on wages, working conditions and industrial relations, comparing multinational enterprises (MNEs) and domestic firms. It brings together data on employment in 10 EU member states (Belgium, Czech Republic, Finland, Germany, Hungary, Netherlands, Poland, Spain, Sweden, UK), derived from Eurostat and an own MNE Database, with outcomes of the worldwide WageIndicator web survey. It details developments in five industries: metal and electronics manufacturing; retail; finance and call centres; ICT, and transport and telecommunications. The first part of the paper depicts developments in Foreign Direct Investment (FDI) and related employment in the 10 EU countries, with special attention for developments in the first years of the current

crisis (2008-2010). The second part concentrates on comparing outcomes of the WageIndicator web survey, covering the period 2006-2011, on three indicators of workplace industrial relations: union membership (density); collective bargaining coverage, and workplace employee representation. MNEs showed higher scores than domestic firms. The results were not unequivocal, but in 18 out of 42 industry / country cases the MNE scores were higher than those of domestic firms on all three yardsticks. The third part contains our search for explaining these surprising outcomes. Particularly relevant seem the larger scale of MNE establishments over those of domestic firms, and the influence of the EU directives dealing with information, consultation and participation of workers.

### The Economic Crisis and Precarity in Europe - How Do the Different Social Groups React?

Thomas P. Boje, Roskilde University | [boje@ruc.dk](mailto:boje@ruc.dk)

Anders Ejrnæs, Roskilde University | [ejernaes@ruc.dk](mailto:ejernaes@ruc.dk)

The global financial crisis has generated worsening economic conditions, falling employment and declining wages for many households around the European states. The economic and social crisis with its devastating economic and social consequences for large groups of the population might have huge political consequences. It has led to marginalization of social groups and it has

threatened the social cohesion in several European countries. Serious financial crisis has historical been linked to authoritarian attitudes and anti democratic behavior. It is claimed that the consequences of the socio-economic crisis could threaten social cohesion by increasing distrust and disengagement in political life (e. g. Standing 2011). It is thus claimed that growing economic insecurity

among the precariat could lead to very different responses among citizens in Europe. One possible response could be growing intolerance, which depicts groups like Muslim, immigrants etc. Another response might be a more idealistic progressive political attitude arguing for solidarity and redistribution. In this paper we examine how perceived economic deprivation during the crisis affects intolerance towards immigrants and unconventional political activities. Furthermore we investigate

how the response to the economic deprivation depends on education, social network and political ideology in the different social groups. Theoretical we combine relative deprivation theory with resource mobilization theory in order to explain the behavioral and attitudinal responses to the experience of economic vulnerability. The empirical data are based on data from European Social Survey (ESS) round five 2010. I

## European Works Councils and their Relevance for Switzerland

Heinz Gabathuler, University of Zurich | [gabathuler@soziologie.uzh.ch](mailto:gabathuler@soziologie.uzh.ch)

Patrick Ziltener, University of Zurich | [ziltener@soziologie.uzh.ch](mailto:ziltener@soziologie.uzh.ch)

The EU Council Directive on European Works Councils (EWC), being one of the legal pillars of EU Social Policy, is not binding for Switzerland, but affecting Swiss companies and employees in a twofold way: Behind the United States and Japan, Switzerland is the third most important "home country" for multinational corporations covered by the Directive but located outside of its geographical scope. (More than 100 Switzerland-based companies are covered by the Directive, and a bit less than half of them do have an EWC.) Due to negotiation successes of European Industry Federations in the 1990s, a large number of EWC agreements - around 160 - foresee the representation of employees in Switzerland on a voluntary basis. The paper will present the results of our quantitative survey of such involvement, showing that

employees in non-EU-member Switzerland in fact do participate in this European labour relations institution to a large extent, however not as they would if the Directive was binding for Switzerland. The paper will also give preliminary findings of our qualitative research on the participatory processes, based on a number of case studies within companies, the EWCs and their articulation with local works councils and trade unions. The case studies are also meant as a contribution towards a better understanding of the interactions between (partly) transnational labour relations on company level and (mostly) national labour relations on industry level, as well as they will give some insight into the peculiarities of labour relations and of workers participation in Switzerland.

## The New World of Work and Employees' New Life-Scripts. A Study of Employees in German Manufacturing and Information and Communication Sectors

Falk Eckert, Universität Hamburg | [falk.eckert@uni-hamburg.de](mailto:falk.eckert@uni-hamburg.de)

The new world of work and employees' new life-scripts. A study of employees in German manufacturing and information and communication sectors. The present world of work and organizations is undergoing a transformation called post-fordistic transition-

regime. There is a kind of social norm which states that one's own 'labor force' must be constantly and attentively marketed in order to maintain one's own 'employability'. A common debate on research in changing work-life relations states that deregulation,

rationalization, reorganization, and flexibility change the circumstances of work organization and blur work boundaries. The increased self-responsibility captures the labor-process as well as the configuration and control of the individual life course. It seems to be clear that reliabilities become frail both in private and work life. But is that causal-chain so strong as it intuitively seems? Are the “market imperatives” really so deep internalized in life-scripts? Do they find expression in workaday-life conduct? The research questions will be answered by using a qualitative method approach. The subjects under study are

German contractual employees in IT and manufacturing or rather processing industries: 5 group discussions and 40 narrative interviews will be compared and analyzed. The preliminary results suggest that similarities exceeds differences as far as the individual life-scripts and labor claims are concerned. Nevertheless differences in the work-life patterns can be stated. Finally, it is discussed how a new institutionalization of life-scripts within post-fordistic work environments and society is raising while the work-life patterns still differ.

## **a02RN17 - New and Old Forms of Representation, Organisation and Conflict**

Chair(s): Bernd Brandl (University of York)

### **Spillover and Conflict in Collective Bargaining: Experimental Evidence of the Role of Learning, Social Comparisons and Reputations**

Alex Lehr, Radboud University, Nijmegen | [a.lehr@fm.ru.nl](mailto:a.lehr@fm.ru.nl)

Jana Vyrastekova, Radboud University, Nijmegen | [j.vyrastekova@fm.ru.nl](mailto:j.vyrastekova@fm.ru.nl)

Agnes Akkerman, Radboud University, Nijmegen | [a.akkerman@fm.ru.nl](mailto:a.akkerman@fm.ru.nl)

René Torenvlied, Leiden University | [r.torenvlied@fsw.leidenuniv.nl](mailto:r.torenvlied@fsw.leidenuniv.nl)

Contemporary studies of industrial conflict increasingly acknowledge that the escalation of one collective bargaining event may be affected by outcomes and conflicts in previous bargaining rounds and by bargaining events in other firms or sectors. Studies using natural data suffer from identification problems and difficulties in defining reference groups. The experimental method allows us to test fundamental assumptions of bargaining models of spillover with full control over the information and reference groups of the negotiators. With experimental evidence we investigate three different, possibly counteracting mechanisms that may account for ‘vertical’ and ‘horizontal’ spillovers: learning, social comparison and reputations.

We use an unstructured two-person bargaining game with asymmetric information. The firm-player knows the surplus, while the union-player only knows the range of values that the surplus may take. After an initial demand by the union-player, both are able to make or accept offers for a limited period of time. 148 students each participated in 15 rounds of interaction, with a random re-matching procedure after each round. Preliminary findings indicate that higher outcomes in reference groups increase the opening demands only when surpluses are correlated, but have a positive effect on both the absolute and relative outcomes of union players, even when the surpluses are not correlated. This indicates that both learning and social

comparisons play a role. However, these spillovers effects are mitigated when firm-players are able to build reputations. Past

failure to agree under some conditions increases the probability of reaching an agreement later on.

## Interorganizational Cooperation - Changes and Conflicts

Irving Palm, Uppsala University | [irving.palm@soc.uu.se](mailto:irving.palm@soc.uu.se)

Interorganizational cooperation – changes and conflicts The welfare society and its actors have been facing great challenges. The development of society with ingredients of globalization and individualization has come to changes and new ways of organizing activities both within private and official sector. Such an organizational change is the wave of increased cooperation between organizations with purpose to do the activities more efficiency. Although the changes are seemed as necessary, they can nevertheless lead to disagreement, crisis and conflicts. Is it possible to reach a position of consensus? Is it possible that the parts in a relation of cooperation work as equal or will a situation of dominance and power emerge? The question of power has been updated as an effect of greater influence and a situation of dominance at a

study of the results of interorganizational cooperation between personal from municipalities and county councils in Sweden. Three different case studies have been performed. Personal have been interviewed at different point in times in order to see how cooperation between groups of personal from different organizations and professions is changed over time. The starting point is that there should be a balanced partnership with the same condition for participation. The study shows that one of the organizations adopts a dominated position depend on bigger resources and asset to professions with higher status. Conflicts happen and some moderating arrangements are taking. The fact remains that a situation of complete freedom from dominance is not possible to reach during existing circumstances.

## Unionizing Young Workers in Europe. A Multilevel Study on Institutions, Working Conditions and Individual Characteristics

Sebastian Koos, Universität Mannheim | [skoos@sowi.uni-mannheim.de](mailto:skoos@sowi.uni-mannheim.de)

Union membership in Europe is declining, while the average age of members is rising. However, trade unions are dependent on the number of workers they organise to secure power. This paper tries to take a specific look at young workers aged 16 to 30 and the constraints and incentives they face in deciding to become a union member. Taking up a multilevel perspective individual workers are analysed in their embeddedness in national institutions, considering personal value

orientations and individual working conditions across Europe. Theoretically institutional theories are extended by actor centred approaches focusing on constraints and motivations. The empirical approach is based on a pooled sample of the European Social Survey (ESS) from 2002 to 2010. By pooling the data a sufficient number of young workers can be identified. Explanations of union membership among young workers are tested using logistic multilevel regression models.

## Resisting “Precarity” in Times of Crisis: Reflections from the Experience of the Italian Activists of “San Precario”

Alessandro Arrigoni, King's College, London | [alessandro.arrigoni@kcl.ac.uk](mailto:alessandro.arrigoni@kcl.ac.uk)

The deep transformations in the processes of production and reproduction of the advanced capitalist countries have been characterized by the flexibilization of the labour market (Amin 1994; Harvey 1989; Piore and Sabel 1984) and by growing difficulties experienced by traditional forms of workers organization, i.e. trade unions. These tendencies seem to be reinforced by the current crisis and by the politics of austerity that characterize its governance. In this context, the concept of “precarity” is becoming increasingly popular for describing the conditions of work and life of growing sector of the workforces. The aim of the paper is to reflect on the challenges that these changes imply for the development of forms of workers' organization and

mobilization. In this sense the paper investigates the potential for the development of alternative forms of struggle able to challenge the condition of “precarity” in a period of generalised crisis. The investigation is based on the fieldwork that I have conducted with the Italian activists of “San Precario”, that since the late 1990's are active in the metropolitan area of Milan. In fact their ‘repertoires of contention’, based on the promotion of forms of self-organization of precarious workers, provide some interesting examples of construction of identities in struggle and of the development of flexible and creative practice of resistance that contribute to the debate on the development of forms of mobilization in this period of crisis.

## b02RN17 - Human Resource Management: Payment and Career

Chair(s): Mirella Baglioni (University of Parma)

### Promotes Study abroad the Labor Market Success in Globalization? Some Hypotheses and Quasi-Experimental Results

Knut Petzold, University of Siegen | [knut.petzold@uni-siegen.de](mailto:knut.petzold@uni-siegen.de)

Tamara Peter, University of Siegen | [tamara.peter@uni-siegen.de](mailto:tamara.peter@uni-siegen.de)

Petra Moog, University of Siegen | [petra.moog@uni-siegen.de](mailto:petra.moog@uni-siegen.de)

Regarding the increasing internationalization of markets and companies a highly skilled and flexible workforce is becoming more and more important. Thus, governments and the education systems invest in the international education of future professionals. Nevertheless, experience and expertise to spatial mobility as a specific resource for labor market success has hardly been explored. In the presentation we will specifically focus on the assessment of international student

mobility by potential employers. The question suggests a reference to the Signaling Theory of Spence (1973). Due to an increase of young academics in the last years, the acquired qualifications do not work as signals of individual productivity anymore. For students, it is obvious, therefore, to acquire additional signals. Studying abroad serves to signal both, general productivity and relevant international skills, so that a separating equilibrium can occur. Nevertheless it can be assumed that the

study abroad mobility not generally acts as a signal but that this effect is caused by the size and internationalization of a company, for example. The assumptions are tested with data from a factorial survey among human resource managers of different companies. Therefore, companies of various sizes and industries were surveyed with an online questionnaire and characteristics relevant for labor markets of

fictitious applicants were experimentally varied. With the obtained data the influences of classical features were tested simultaneously with the influence of study abroad experience. The analysis results provide the first evidence that study abroad mobility is not generally perceived as separating signal by human resource managers in different companies.

## Boundaries in the “Boundaryless Career”

Sven Svensson, Mid Sweden University | [sven.svensson@miun.se](mailto:sven.svensson@miun.se)

The idea of the “boundaryless careers” has been proposed as both a suitable and preferable description and of the relation between people and their work in what is often referred to as the “new economy”. People involved in “boundaryless careers” are supposedly, highly efficacious, pursuing their career as true embodiment’s of individual agency, involved in a continuous skill-development across organizational boundaries. Skill-development, or employability development, is of crucial importance for the idea of “boundaryless careers” since a constant switching between different assignments in different organizations demands a broad set of up-to-date skills. This study takes a critical stance to the idea of “boundaryless careers”. Previous research has shown how employability predicts self-efficacy. In departing from sociological theory of identity

and the sense of self this study proposes that people’s sense of self-efficacy and employability-development are, even if positively related, dependent on perceptions of how the surrounding society values one’s work. The theoretical propositions are tested in a quantitative analysis of non-standard workers involved in what could be described as “boundaryless careers” (approx. 250 temporary agency workers and contractors) and 500 standard employees of a Swedish organization. The results show that the relationship between employability-development and self-efficacy is mediated by perceptions of what status one’s work has (perceived occupational prestige), implying that the individual agency of people involved in “boundaryless careers” indeed do have boundaries.

## When Quality Management Meets Worker Agency: Case Study Evidence from Finnish Metalworking Shops

Markku Sippola, University of Eastern Finland | [markku.sippola@uef.fi](mailto:markku.sippola@uef.fi)

Timo Anttila, University of Jyväskylä | [timo.e.e.anttila@jyu.fi](mailto:timo.e.e.anttila@jyu.fi)

Organisational change associated with the introduction of total quality management has continued over last decade in Finnish workplaces. Traditionally, a high organisational strength, participation in decision-making and job autonomy have been characteristics of the

Finnish workplace. It seems, however, that the workers are rather passive objects of workplace change with respect to lean production. This notion led us to analyse the labour process at four Finnish metalworking shops, where we made interviews with

employees, trade union shop stewards and workers. It was observed that the employees approved quality measures in order to secure smooth running of work process, which seemed to prove the relevance of the 'disciplined worker' thesis on one hand, and workers' consent, on the other. As workers silently internalise the necessity of quality principles, the management gains better control over them. Further analysis, however, gave evidence on 'subjectivity' argument of the labour process, which allows us to bridge the

'missing subject' gap in labour process theory. In contrast to the disciplined worker thesis, we found that the workers are actively negotiating and re-negotiating their job effort within the boundaries set by quality control and beyond. Sometimes leeway is allowed for workers in form of individual 'free-rider' behaviour. In compliance with the Finnish industrial relations model, it is the trade union which takes part in the effort bargaining especially at larger plants.

## a03RN17 - Europeanization of Industrial Relations

Chair(s): John F. Geary (University College, Dublin)

### The Impact of the Economic Crisis on the Differentiated Europeanization of Labour / Capital Joint Management Commissions in France and Italy

Josua Gräbener, Grenoble Institute of Political Studies | [josua.grabener@iepg.fr](mailto:josua.grabener@iepg.fr)

The institutionalization of labour / capital joint management commissions for the continuous training of workers (Italian FPI; French OPCA) has taken divergent paths. Using public subsidies but running private actions, these hybrid institutions are also under potential European influence, as they use European Social Funds to develop the actions for the enterprises. Since the European Employment Strategy mostly seeks to promote the low qualified workers and more generally those workers that are the more at risk of exclusion in case of enterprise bankrupt, these FPI and OPCA often face some contradictory challenges. On one hand they are expected by the member enterprises to update workers skills, for rather economic purposes, thus rarely echoing more social objectives linked to the public subsidies. On the other hand, the

relation to the public authorities (both State and regions) becomes itself ambiguous as they depend on them to develop actions, but are willing to keep their autonomy against "public intrusion". To what extent has the economic crisis shaking both the relation to skills and qualifications for workers and enterprises, and the amount of resources available, changed the reactions to European incentives by labour / capital joint management commissions? Which are the differences not only across these 2 countries but also across the sectors of activity? This paper will bring some evidence based on 60 interviews and the preliminary results of a questionnaire for quantitative purposes, held during our PhD investigation, in order to reply to these questions.

## Europeanization, Corporate Governance and Firm Competitiveness: Assessing Impacts of the European Company on Worker Participation

**Antje Fiedler**, University of Auckland | [a.fiedler@auckland.ac.nz](mailto:a.fiedler@auckland.ac.nz)

**Catherine Casey**, University of Leicester | [c.casey@leicester.ac.uk](mailto:c.casey@leicester.ac.uk)

**Benjamin Philippe Fath**, University of Auckland | [b.fath@auckland.ac.nz](mailto:b.fath@auckland.ac.nz)

The European Company (Societas Europaea or SE) statute aims to increase competitiveness for European companies by enabling greater flexibility in a company's choice of corporate governance system. Firms can transfer their head office to another member state, in which they hold a subsidiary, and follow the national regulation applicable to the head office across the entire organisation. As a result of this statutory provision, questions of worker participation in corporate governance systems feature prominently in the debates. Researchers have proposed that worker participation may be both a positive and negative driver of company decisions to re-incorporate as an SE. However, it remains inconclusive how firms have enacted the SE statute and how their enactment affects

competitiveness, industrial relations and worker participation in the EU. This paper principally addresses questions of worker participation. Does re-incorporation as an SE increase or diminish scope for workers' participation? Are SE's escaping, or exporting, co-determination? In particular, this paper highlights variations in different industries with different rules of competition and which add further complexity to the debates. Drawing on research literature, qualitative empirical data and the ETUI (European Trade Union Institute) SE data base, this study investigates how firms enact the SE statute to increase their competitiveness. It discusses consequences of these choices for workers' participation and industrial relations in the EU.

## European Sector Level Bargaining: Prospects and Drawbacks

**Barbara Bechter**, University of York | [barbara.bechter@york.ac.uk](mailto:barbara.bechter@york.ac.uk)

**Bernd Brandl**, University of York | [bernd.brandl@york.ac.uk](mailto:bernd.brandl@york.ac.uk)

**Guglielmo Meardi**, Warwick Business School | [guglielmo.meardi@wbs.ac.uk](mailto:guglielmo.meardi@wbs.ac.uk)

This study examines industrial relations (IR) practices and structures in nine sectors across all European Union Member States and the potential for agreements on joint labour standards. High levels of diversification of IR pose major challenges to the regulation of labour standards within and across countries. The European Commission supports the development of the European sectoral social dialogue, recognising sectors as an important level of social dialogue. European Sectoral

Social Dialogue Committees (ESSDC) established by the European Commission build the institutional framework of organisational articulation of both employer and labour at European sectoral level. The aim of this study is to analyse specific sectoral industrial relations factors in nine sectors across the European member states that are partially accountable for European level coordination of labour standards.

## Europeanization Due to Institutions or Attitudes? The Role of Formal Worker-Representation in Labour Relations

Vera Trappmann, Otto-von-Guericke University | [vera.trappmann@ovgu.de](mailto:vera.trappmann@ovgu.de)

This paper analyzes the Europeanization of industrial relations in Central Europe. Based on a quantitative survey in Poland, Hungary and Germany, it looks into the effect of labour representation at company level. It examines whether the existence of works councils or trade-union committees have an effect on business leaders' attitudes towards the role of business in society, leadership style and company policies. Three results are particularly revealing: 1. Works councils and

trade-union committees in Poland and Hungary have different respective impacts on employment relations; 2. The existence or absence of a labour representation influence differences in business-leaders' attitudes, rather than the personal backgrounds of leaders; 3. In contrast to expectations about dependent market economies, foreign ownership does not explain much of the found variation, as opposed to organisational aspects such as size.

## b03RN17 - Worker Participation: Macro and Micro Perspectives

Chair(s): Mirella Baglioni (University of Parma)

### The ICE Directive in LMEs: A Prisoner's Dilemma?

Eugene Hickland, National University of Ireland, Galway | [e.hickland1@nuigalway.ie](mailto:e.hickland1@nuigalway.ie)

Tony Dundon, National University of Ireland, Galway | [tony.dundon@nuigalway.ie](mailto:tony.dundon@nuigalway.ie)

Tony Dobbins, University of Bangor | [a.dobbins@bangor.ac.uk](mailto:a.dobbins@bangor.ac.uk)

Niall Cullinane, Queens University, Belfast | [n.cullinane@qub.ac.uk](mailto:n.cullinane@qub.ac.uk)

Jimmy Donaghey, University of Warwick | [jimmy.donaghey@wbs.ac.uk](mailto:jimmy.donaghey@wbs.ac.uk)

The debate on the balance of efficiency, equity and voice concerns in contemporary work and employment contexts (Budd, 2004). Specifically, the paper considers the impact of the transposition of the EU Information and Consultation of Employees (ICE) Directive in the voluntarist Liberal Market Economies (LMEs) of the United Kingdom (UK) and Republic of Ireland (ROI). The research assesses the extent to which the Directive and subsequent transposed legislation has promoted social dialogue at work. It concludes, using the theoretical lens of the prisons dilemma, that such a regulatory approach has resulted in mutual 'losses' rather than mutual

gains for employers, employees, unions, and the state. The multi-case data in both jurisdictions will show the Directive has had little impact at micro organizational level in line with the original intent of the Directive (Hall et al., 2011). The paper then advances the idea of Leibenstein's (1982) 'prisoner's dilemma' concept to help explain the limited impact or diffusion of regulated voice in the UK and ROI (Freeman and Lazear, 1995; Marsden and Canibano, 2011). This is due to what Leibenstein (1982) calls 'x-inefficiency', which is conceptualised as a prisoner's dilemma. Sharing information and productivity gains may appear to be an issue of mutual interest. In

reality, voice often involves power resource mobilisation. In LME contexts, there is a fear that either party may unilaterally exploit the other sides' weaker power position and pursue their own short-term self interest rather than

choose mutually beneficial options. Liebenstein (1982) observes that a prisoner's dilemma is a zero-sum game (one parties' gain is equal to the others loss).

## Going beyond the Capital-Labour Divide: Some Insights from an Organizational Analysis of Worker Participation at the Workplace

**Ylenia Curzi**, University of Modena and Reggio Emilia | [ylenia.curzi@gmail.com](mailto:ylenia.curzi@gmail.com)

**Tommaso M. Fabbri**, University of Modena and Reggio Emilia | [tommaso.fabbri@unimore.it](mailto:tommaso.fabbri@unimore.it)

The current debate is devoting increasing attention to organizational innovation as a key choice to escape from the present crisis, and on worker participation in decision-making processes at the workplace as a key factor for organizational innovation. The present paper addresses this issue with a twofold objective. It firstly aims at critically reflecting on the managerial practices most often used to foster worker participation. These practices are centred on tools for evaluating workers skills. Notwithstanding, they are drawn from theories that make them unsuitable to promote the kind of worker participation needed for organizational innovation. The problem lies in the theoretical assumption that top management should pre-determine the skills that workers need to participate in decision-making processes. It doesn't matter that it concerns skills rather than behaviours,

predetermination still hinders organizational innovation, and in complex working conditions it jeopardizes both economic performance and organizational equity. In light of that, the paper shall outline an approach to competence evaluation based on different assumptions, and namely on the idea that behaviours and knowledge can be partly pre-ruled, but workers can always change any pre-regulations before and during the accomplishment of work for both reaching the economic performance and satisfying their personal needs. The competence evaluation approach discussed in the paper thus makes new room for considering worker participation as a means to simultaneously satisfy different criteria of rationality. This consistently with a view of labour relations as relations where power is a non-zero-sum game.

## Successful Cooperativist Actions – Grassroots Democracy

**Tinka T Schubert**, University of Barcelona | [tschubert@ub.edu](mailto:tschubert@ub.edu)

**Ramon Flecha**, University of Barcelona | [ramon.flecha@ub.edu](mailto:ramon.flecha@ub.edu)

**Manuel Roblizo**, University of Castilla-La Mancha | [Manuel.Roblizo@uclm.es](mailto:Manuel.Roblizo@uclm.es)

In this paper, we present the most recent results of a programme of research developed by INCLUD-ED (Integrated Project of the FP6 of the European Commission) and the project on "Competitive Cooperativism: Contributions to sustainability and quality of employment in the current economic situation" (RTD project of the

Spanish National Plan). Both projects are part of an international network of research on "Successful non-capitalist companies" coordinated by Erik-Olin Wright and Ramon Flecha. The INCLUD-ED identified Successful Actions (SAs) in diverse social areas. In employment, the Mondragon Corporation has

been analyzed, outstanding for its economic success not only in Spain (10th largest entrepreneurial group) but in the global market and, simultaneously, it maintains its democratic values and social impact. Five Successful Cooperativist Actions (SCAs) were identified in the cooperatives of Mondragon. In this paper we focus on the worker participation in the government and management through the grassroots democracy and its impact on the workers and community. The organizational structure of the Mondragon

Corporation has established the necessary management bodies and mechanisms to maintain the democratic principles. Most of the decisions are taken in assemblies according to this principle and for this reason the decisions taken by the workers not only favour the company but also the workers and the social environment. This is especially relevant in decisions addressed to facing the economic crisis. The workers of the Mondragon Corporation have taken specific decisions to maintain employment and the cooperatives.

## **Employee Participation in the Context of the Global Financial Crisis – Evidence from two German Case Studies**

Olaf Kranz, University of Regensburg | [olaf.kranz@wiwi.uni-regensburg.de](mailto:olaf.kranz@wiwi.uni-regensburg.de)

My presentation aims to explore the link between corporate crises and decisions about employee participation in the context of the Global Financial Crisis (GFC). In order to do so I complement Weick's sensemaking perspective (1995) with some distinctions taken from social systems theory (Luhmann 2000). Within this theoretical framework I examine the influence of a communicated corporate crisis on decisions regarding employee participation in two German companies over a two-year period immediately following the outbreak of the GFC. Either of the two companies had intended to initiate a reform of their participative structures to face the challenges of economic globalization before the GFC occurred. So, I am able to examine the impact of a communicated crisis on (1) the fate of the reform projects of employee participation, on (2) other

organizational reforms, and (3) on decisions made within the net of existing structures of employee participation. My findings show that the meaning of a communicated and enacted corporate crisis sets a company in a state of alert and provokes some distinctive reactions. These include an accentuation of a traditional hierarchical style of decision-making and an authoritarian leadership style, some distinctive key personnel changes, and a strong orientation towards senior management. Any reforms of immaterial employee participation are rejected and the institutions that represent employees engage in a passive co-management. Overall, the study offers some novel insights about the meaning of crisis and of employee participation as well as about how these meanings affect decision-making processes.

## a05RN17 - Changing Security and Quality of Work

Chair(s): Barbara Bechter (University of York)

### The Danish Flexicurity Model: Origins and Future Prospects

Per H. Jensen, Aalborg University | [perh@dps.aau.dk](mailto:perh@dps.aau.dk)

The Danish flexicurity model has been praised by the European Union as a model for European inclusion and employment strategies. The Danish flexicurity model is based on a partnership between the state, employers' associations and trade unions. Institutionally, the Danish flexicurity model stands on three legs: First, in Denmark the level of employment protection is very low, meaning that employers can fire employees at a very short notice. Second, the state provides generous unemployment benefits, which soften the resistance against dismissals among employees and trade unions. Third, the state provides active labour market policies targeting unemployed people with an emphasis on educational measures, epitomised as a "human capital" rather than a "work first" strategy. The three dimensions of Danish flexicurity is a mechanism for employment

growth in a highly flexible labour market. The Danish flexicurity system has been praised as a model to imitate in other European countries. To fully understand the transferability potentials of the Danish flexicurity model, however, would call for an investigation of the specific sociological and historical preconditions of the Danish model. Therefore, the aim of this paper is twofold: First, it scrutinizes the historical origins of the Danish flexicurity regime; it will be argued that the Danish flexicurity model has deep historical roots and is anchored in craft unionism, which predominate the Danish trade union structure. Second, the future of the Danish flexicurity regime will be discussed, as it will be demonstrated how the coming of the post-industrial society challenges the Danish flexicurity model.

### Fast Lane or Down the Drain? Does the Occupation Held Prior to Unemployment Shape the Transition from Unemployment into Employment?

Anna E. Hägglund, Leibniz University, Hannover | [e.haeggglund@ish.uni-hannover.de](mailto:e.haeggglund@ish.uni-hannover.de)

By means of longitudinal data drawn from the National Educational Panel Study (NEPS), the study addresses how the pre-unemployment occupation structures unemployment trajectories in Germany in the time frame 1996-2009. I explore whether specific characteristics of the occupation held prior to unemployment are able to impede or enhance the negative effects stemming from job loss on further employment patterns, assessing how mechanisms operating at the occupational level transform into micro-level outcomes. While a substantial body of literature

approaches unemployment trajectories in Germany, existing research has not yet systematically addressed the influence of occupations. Given the strong occupational boundaries, which characterize the German labor market, it can be expected that some occupations enable better possibilities to re-enter, because their skills are more adaptable, or because they are more protected by occupational licenses. Moreover, it can be assumed that strong labour market unions, characterizing for certain occupations, counteract scarring effects of unemployment.

Consequently, the analyses assess how the degree of social closure and the gender composition of an occupation shape the transition back to work. By focusing on different dimensions of the transition, namely the duration time in unemployment, the risk of downward mobility and occupational switches in the subsequent employment episode, the

study addresses various dimensions of indirect scarring effects. The preliminary results of the discrete-time event history analyses indicate that the gender composition of the pre-unemployment occupation matters for predicting the transition, yet in a different way for men and women.

## The Effect of Job Quality on Early Retirement in Finland

**Tomi S Oinas**, University of Jyväskylä | [tomi.oinas@jyu.fi](mailto:tomi.oinas@jyu.fi)

**Timo Anttila**, University of Jyväskylä | [timo.e.e.anttila@jyu.fi](mailto:timo.e.e.anttila@jyu.fi)

We present first results from project examining how different dimensions of job quality affect individually and in combination to early retirement in Finland. In the background of our research is the lively discussion on aging workforce and need for increasing employment levels in Europe. Concerns regarding the long-term financial sustainability of the welfare state have stimulated a renewed research interest in retirement behavior. In Finland the question on prolonging working lives is especially acute in as Finland is currently one of the most rapidly ageing countries in the world towards 2020. According to previous research high job quality is a factor that increases both the ability and willingness of workers to stay longer in work life. However,

there are probable differences between various dimensions of job quality in that how strongly they affect retirement. In addition, earlier have concentrated on retirement intentions instead of actual retirement behavior. There is thus need for further research that addresses the question of effect of job quality on early retirement using broader concept of job quality and actual retirement behavior. Our analyses are based on Finnish Quality of Work Life Surveys from 1990 to 2008 merged with annual register-based follow-up data. We employ Job Quality Index (Muñoz de Bustillo et al. 2011) to identify key dimensions of job quality: pay, intrinsic characteristics of the job, terms of employment, health and safety, and work-life balance.

## Whose Insecurity – Which Insecurity?

**Antti Saloniemi**, University of Tampere | [antti.saloniemi@uta.fi](mailto:antti.saloniemi@uta.fi)

**Anna K. Väisänen**, University of Tampere | [Anna-Katarina.Vaisanen@uta.fi](mailto:Anna-Katarina.Vaisanen@uta.fi)

In contemporary working life job insecurity (=JI) is an essential source of inequality. The division between secure and insecure positions at work reflects disparities in well-being and organizational attitudes. Due to the current crisis, the importance of JI is of paramount interest. The purpose of our presentation is to clarify the structural background of JI. To avoid simple generalization, we split JI in two aspects: quantitative (the threat: job loss) and

qualitative (the threat: downward trend in the quality of current job). The material comes from a Finnish survey (n= 2252). In total 11% of responders reported quantitative JI, the corresponding proportion in qualitative JI was 14% of responders. The main results are twofold: (i) Against the statements of “risk society” theories, quantitative JI mirrors clearly traditional segmentation of the labor market: Together with advanced age and

working in manufacturing, it was linked with low income and work history with unemployment spells. (ii) The qualitative JI was however more evenly distributed among employees: only women and employees working in the bigger units had a special risk for high qualitative JI. The background of these two types of JI turned out to be different: Only the qualitative dimension was in line with the

idea of JI as a “universal risk” in the labor market. To improve the quality of the work should be an expected way to intervene the problem of qualitative JI. This solution, however, feels unlikely in these turbulent times. Likewise unlikely is the idea of controlling quantitative JI by increasing regulation.

## **b05RN17 - Changing Industrial Relations in the Private and Public Sector**

Chair(s): Volker Telljohann (European Policies - IRES Emilia-Romagna)

### **When Differences Rhyme with both Transfer of Skills and Condescension. The Dynamics of a European Works Council (EWC) in French Public Company**

Denis J. Monneuse, University Paris I-Sorbonne | [denismonneuse@gmail.com](mailto:denismonneuse@gmail.com)

Are European Works Councils (EWCs) models of trade union cooperation? A systematic use of information and communication technology is necessary to act jointly across borders (Whittall, Knudsen, and Huijgen 2009), but it is not a sufficient condition. Brought together in a transnational context, workers' representatives often suffer from 'dissonant cognitions' on account of the absence of commonly constituted 'background assumptions' (Timming, 2010). Drawing from a detailed case study conducted within the EWC of a French public company, this paper explores the dynamics of cross-national labor relations. It highlights the development of a common identity among French employee representatives from different trade unions in spite of the competition between them at the national level. Given their number (almost half

of the EWC's members), their knowledge of the top executives and the legitimacy granted to them by their country's protective labor laws, the French representatives are the main actors of the EWC. On the one hand, they transfer their experience and their know-how to others. On the other, they patronize the other delegations, especially those from Eastern Europe, who enjoy less status and less favorable working conditions in their respective country than the ones observed in the French factories. Hence, French representatives abstain from any learning coming from their fellow members. There is no dialog, but a one-sided speech! This dynamic is exemplified by the interpersonal relations between the French and the other delegations; some are in awe of them, whereas others discreetly denounce a neo-colonialist attitude.

## Public Sector Procurement and the Promotion of Employment Equality: The London Olympics Case

Tessa Wright, Queen Mary, University of London | [t.wright@qmul.ac.uk](mailto:t.wright@qmul.ac.uk)

One casualty of economic crisis can be equality action to address the underrepresentation of disadvantaged groups in the labour market. In the UK, progress made on equality legislation is under threat from deregulation, while women, disabled and black and minority ethnic workers are particularly vulnerable to job loss during times of recession and intensive public sector spending cuts (EHRC, 2009, TUC, 2012). Continued privatisation of public services is removing employees from the (albeit limited) protections afforded by the Public Sector Equality Duties that require public authorities to consider the elimination of unlawful discrimination and the promotion of equality of opportunity in carrying out their functions. In this context the paper considers how public sector bodies can use procurement processes to achieve equality objectives, through which employment equality requirements are

incorporated into contracts with private sector companies. It examines the case of the construction of the Olympic Park in London, during which the public body responsible for the project, the Olympic Delivery Authority, required firms winning contracts to include targets for employment of women, ethnic minority and disabled workers, as well encouraging the use of labour from the local area characterised by high levels of unemployment. Using this case, the paper situates key actors - trade unions, public and private sector employers and statutory agencies - within a framework of voluntarism versus regulation in the equality and diversity field (Özbilgin and Tatli, 2011). It finds that political will from public authorities, not equality legislation alone, can produce change in the employment practices of private sector construction firms

## Commitment to Current Work and Employment in General: Finland in a European Comparison

Teemu Turunen, University of Helsinki | [teemu.t.turunen@helsinki.fi](mailto:teemu.t.turunen@helsinki.fi)

Currently, the European Union and its Member States are attempting to address the economic challenge of the deteriorating economic dependency ratio as well as global financial crisis by increasing the employment rate of citizens, among other things (Council of the European Union 2010). Attaining and maintaining high employment rates requires individuals to show a strong commitment to paid work. Employee commitment is also vital for organisations. This paper compares (non-financial) employment commitment and commitment to current work among employees in 27 European countries with the help of European Social Survey-data (ESS,

Round 5), collected in 2010. The effects of individual-level characteristics and organisation-level factors on these types of commitments are analyzed in the paper. In addition to this, the effects of Shalom H. Schwartz's (2009) cultural dimensions on (non-financial) employment commitment are studied in the paper. This is made possible by the inclusion of Schwartz's Human Values Scale in the ESS-data. The main focus in the paper is on whether these commitments differ in Finland from those in other European countries. The Finnish employees did not display particularly high levels of employment and organisational commitment in a European

comparison when using data from Work Orientation Module III of International Social Survey Program (ISSP), collected in 2005–2006 (Turunen 2011). The current paper makes it

possible to analyse the possible stability of the position of the Finnish employees regarding these types of commitments.

## **a06RN17 - The Impact and Consequences of Internationalization and Globalization on Labour Standards and Industrial Relations**

Chair(s): Alessia Vatta (University of Trieste)

### **The Makings of a Scandal: Differences in Chinese and American Values with Regards to Labor Standards in Transnational Corporations**

Aren LaBianca, University of Oslo | [aren\\_sl@hotmail.com](mailto:aren_sl@hotmail.com)

This paper explores how differences in Chinese and American values with regards to labor standards creates pressure on transnational corporations to meet the national labor rights standards of all countries involved, as well as international CSR standards, usually requiring more extensive CSR than required by any one of those entities alone. I analyze the case study of the iPhone manufacturer Foxconn Technology Group and the CSR media scandal that occurred following the publication of a series of three reports by Guangdong's hard hitting and often controversial newspaper Southern Weekend (南方周末) exploring the realities of workers' lives at a Foxconn factory in Shenzhen. Through discourse analysis I identify differences in the perception and

presentation of the scandal by representative high-circulation Chinese and American news sources, particularly highlighting allegations of worker mistreatment. I show how there is a greater focus on workers' broken dreams and the lack of community and social life at Foxconn in the Chinese articles, and a greater focus on excessive overtime, long work hours, and dehumanization of workers in the American articles, highlighting different priorities and values with regards to labor rights. I then explore how such differing values with regards to labor rights leave transnational corporations in an awkward position where few, if any, standardized CSR strategies will guarantee them protection from accusations of worker mistreatment.

### **Redundancy Provision in the Context of Global Financial Crisis: A Cross-National Study of New Zealand, Australia and South Pacific Island Nations**

Jane Parker, Massey University | [parker01@rocketmail.com](mailto:parker01@rocketmail.com)

James Arrowsmith, Massey University | [j.arrowsmith@massey.ac.nz](mailto:j.arrowsmith@massey.ac.nz)

Global financial crisis has prompted industry to respond with 'austerity' strategies. These have often included a slew of redundancies, both voluntary and forced. The rationale for and conduct of lay-offs are framed by international

labour standards, particularly for signatory nations by the ILO Convention 158 and its accompanying recommendation on Termination of Employment. Article 4 of the Convention specifies that the employment of a

worker should not be terminated without a valid reason relating to the capacity or conduct of the worker or based on the operational requirements of the enterprise. Other reasons not to terminate employees are outlined in Article 5, including their trade union involvement and 'identity' characteristics such as race, sex, marital status and political opinion. Procedures prior to, around and following termination, income protection measures, and the need for consultation of workers' representation are also outlined. Via a thematic analysis of extant qualitative and quantitative research, this paper assesses redundancy provisions in national regulation for New Zealand, Australia and South Pacific

island nations against the Convention's requirements, paying attention to the political, socio-economic and labour market commonalities and specificities of those countries. The authors conclude that, in many of the developing as well as developed economies of the South Pacific, redundancy provision has been deficient, with particular implications for vulnerable workers; for possible change in the conduct of signatory nations to meet Convention requirements in order to promote 'decent' workplace approaches; and for re-thinking financial and social justice goal prioritisation by corporations.

## **Capacity-Building of Global Unions in Mobilizing for Better Working Conditions for Cross-Border Temporary Agency Workers**

**Karen A Shire**, University Duisburg-Essen | [karen.shire@uni-due.de](mailto:karen.shire@uni-due.de)

**Steffen Heinrich**, University Duisburg-Essen | [steffen.heinrich@uni-due.de](mailto:steffen.heinrich@uni-due.de)

With the unification of temporary work regulations through the EU Temporary Work Directive in 2008, and the lifting of the remaining moratoriums on labor mobility from almost all new EU member states in Eastern Europe in 2011, global temporary staffing firms have intensified their placements of agency workers across national borders, especially from the new EU member states. The triangular nature of agency work means, that workers are not employed by the firms where they work. While national and EU-level regulations now provide some minimum social protections covering agency employment contracts, on-site work relations remain outside their scope. This paper addresses the organizational and political capacities being developed by global unions to negotiate better working conditions for temporary workers. In the two most important transnational unions for agency workers in Europe – Uni Europa and

industriAll – we find two quite different strategies – the first oriented more towards new governance mechanisms, such as codes of conduct, but also involving peak-level regulatory lobbying and negotiation with European-level social partners, the second oriented more towards a union revival strategy based in protest, but also new forms, such as campaigns targeted against specific employers. We address the extent to which organizational capacities support these political and mobilization strategies. Much of the recent literature on transnational labor representation has focused either on industrial unions and institutions like works councils and collective bargaining (e.g. in construction, automobiles). This paper contributes to understanding union organization in other sectors of services where non-regular work is more common.

## Transnational Industrial Relations: Participation, Austerity and Innovation

Isabel da Costa, National Center for Scientific Research, France | [isabel.da-costa@idhe.ens-cachan.fr](mailto:isabel.da-costa@idhe.ens-cachan.fr)

The literature about the “Europeanization” and the “internationalization” of industrial relations has increasingly been dealing in recent years with transnational framework or company agreements and the European Commission database on transnational company agreements currently contains over 200 such texts. Do these new tools of transnational industrial relations at the company level also constitute a new form of regulation? How have they changed with the crisis? First different levels and actors of transnational industrial

relations will be identified, among which multinational firms, Global Union Federations, European Industry Federations, and/or European Works Councils. Then existing transnational forms of regulation will be analyzed with particular attention to restructuring and the crises. The conclusion will reconsider the notion of “industrial democracy” and outline the evolution of the notion of “participation” as applied to the transnational level.

## b06RN17 - Migration and Industrial Relations I

Chair(s): Alex Lehr (Radboud University, Nijmegen)

### The Added Value of the Migrant Work Force. Questioning the Role of the Foreign Workers from the Perspective of the Employers

Eleonora Castagnone, FIERI, Torino | [castagnone@fierit.it](mailto:castagnone@fierit.it)

The contribution of the migrant workforce to the Italian labour market has become a phenomenon of structural proportions and an essential component in the functioning of the Italian economy, in the last decades. However, while the research on the economic integration of migrants in the receiving economies has been mainly focused on the supply side, i.e. on the characteristics and on the outcomes of foreign labour force, little research has explored this phenomenon from the point of view of the demand, i.e. of the employers. In spite of an evident structural phenomenon of substitution (i.e. deficit of the supply of native workers replaced by the foreigner ones), the migrant labour force demonstrates to offer competitive advantages, at least at three levels. First, the educational level and the qualifications held by foreigners are often

higher than the positions actually covered, constituting an added value for the employers in terms of efficiency and competitiveness, at least in the short-medium term. The second advantage relies on psychological-cultural skills of migrant workers, and in particular on a relevant “motivational capital” own by migrants, derived from a strong incentive of maximisation of the migration investment. The third aspect of “added value” derived from the foreign labour relies, finally, on some specific technical and professional skills own by migrants. According to the employers’ perspective, migrants are becoming non only a ‘second best option’, replacing the shortage of the native labour supply, but also preferable and competitive. However the costs associated to such an economic and political model of labour migration governance and its

sustainability should not be disregarded.

## **Economic Growth and Structural Features of Transition. Local Concepts of Work Change When Confronted With Translocal, Transregional, or Transnational Challenges**

Mei-Ling Lin, National Open University, Taiwan | [paulina@kcg.gov.tw](mailto:paulina@kcg.gov.tw)

The impact of transition, growth and structural change is significant in labour markets, in terms of their quantitative (unemployment and employment dynamics) and qualitative (quality of jobs, youth performance) effects. The paper identifies main areas of influence which may generate important feedback with the process of institutional change: economic growth and development, structural change and regional performance, income inequality and labour market evolution, and relations and shocks in the global economy. The author highlights the importance of regional differences: (i) when unemployment is positively related to workers' reallocation across regions, spatial unemployment differentials increase, (ii) identify the complex mechanisms of regional labour market adjustment in transition. The paper presents some key data concerning the process of institutional, economic and

structural change. The outline of this paper is as follows: Section 1 briefly recalls the complexities of the transformation and brings to the fore the asymmetric role of structural change. Section 2 discusses the results of the literature on regional job and worker turnover in the local communities. Section 3 highlights the role that trade has on regional labour market differences. Section 4 asks and answers the question whether migration is reducing or reinforcing regional unemployment differences. Section 5 highlights the important role of human capital as a factor of divergence. The last two sections draw some policy implications by looking at the national and Asia regional policy, as well as at labour market policy. Some concluding remarks follow. The methods of the study include literature review and survey research.

## **Trade Union Responses to Transnational Labour Mobility in the Finnish-Estonian Context**

Rolle Alho, University of Turku | [rolle.alho@helsinki.fi](mailto:rolle.alho@helsinki.fi)

My presentation is based on my ongoing PhD study on the relationship between trade unions and migration. In my presentation I will examine trade union strategies in relation to labor migration in Estonia and Finland, drawing on face-to-face interviews with trade unionists and official union statements. I consider that the respective national trade union strategies are located in two separate but interconnected localities which represent different approaches to market economy. Previous research suggests that the national industrial relations system is a key factor in

explaining unions' labor migration strategies. Unions operating in liberal market economies are claimed to be more open towards immigration and more inclusive towards immigrants than unions in coordinated markets. This study analyzes the extent to which this theory holds in the context of Estonia and Finland – Finland representing a coordinated market economy and Estonia a liberal market economy. Furthermore, the analysis examines how the emergence of a translocal labor market, resulting from the geographical vicinity and linguistic affinity

between Finland and Estonia as well as from free mobility within the EU, is reflected in trade union approaches to labor migration. My key finding is that Finnish trade union strategies influence labor mobility, whereas Estonian trade unions remain bystanders in the issue.

The explanation to this is related to the stronger power resources of Finnish trade unions in comparison to the Estonian unions. Also the specific national migration histories shape trade union perceptions and strategies in respective countries.

### **Dynamics and Limits to Migrant Worker Participation in Trade Unions**

Adrien Thomas, CEPS/INSTEAD, Luxembourg | [adrien.thomas@ceps.lu](mailto:adrien.thomas@ceps.lu)

This contribution will discuss internal trade union dynamics and negotiations around the participation of migrant workers, discussing findings of the broader literature on trade union revitalization which tends to recommend organizational diversification in order to include new categories of members like migrants for instance. Using a case study conducted in Luxembourg, the dynamics and limits of specific trade union departments for migrants and cross-border workers will be discussed, as well as their effects on internal union cohesion and social interactions within unions. As some of these specific departments have existed for up to 20 years in Luxembourg unions, the time dimension will be taken into account in order to give greater depth to the analysis. Due to its multinational labour

market, Luxembourg can be considered as a laboratory providing valuable insights into larger debates around migrant worker participation. Indeed, belonging to the historical core of the European Union, Luxembourg has a highly internationalized labour market. In March 2012, 43.7% of jobs were filled by cross-border workers, 27.2% by resident immigrants and 29.1% by native residents. Luxembourg seems to represent an example of relative success of union representation of an internationalized labour market. With an overall unionization rate of 37% in 2008 according to the OECD, 35% of Portuguese immigrant workers in Luxembourg are trade union members, as well as 27% of Belgian immigrants and 19% of French immigrants.

### **Temporary Organizing in Trade Unions as a Response to Increasingly Challenging Environment**

Joanna Karmowska, Oxford Brookes University | [jkarmowska@brookes.ac.uk](mailto:jkarmowska@brookes.ac.uk)

John Child, University of Birmingham | [j.child@bham.ac.uk](mailto:j.child@bham.ac.uk)

Phil James, Oxford Brookes University | [pjames@brookes.ac.uk](mailto:pjames@brookes.ac.uk)

The paper reports the life of a temporary British trade union branch set up to cater for Polish migrant workers. It identifies the key

characteristics of a trade union temporary organization and how these contrast with those of the typically researched commercial ones. It

reveals how goal incongruence and role ambiguity among stakeholders impacted the processes of creating, leading and finally dissolving the branch. Temporary organizing is common in various commercial sectors, such as consultancy or film industry. It is suitable for experiments and/or bringing new controversial solutions to existing structures. It also helps to meet the differentiated needs of customers. Such organizations can further help to overcome traditional barriers to change at personal as well as organizational levels. Relatively little attention has, however, been given to temporary organizing in trade unions. The longitudinal study was of the Southampton migrant workers' branch of the GMB union. The bottom-up initiative represented a low-risk

experiment, encouraged by external funding available for its development. The limited commitment of union resources, however, caused a detachment of the branch from the main structures and, to some extent, disappointment among the local stakeholders. Although the branch only partly fulfilled its aims, it increased union membership in Southampton area and offered valued day-to-day support to Polish migrant workers. It facilitated the union's response to new opportunities related to the influx of migrant workers to the UK. On the other hand, the venture can be considered to have been problematic in terms of the co-ordination of its activities and knowledge transfer.

## Researching Polish Migrants Working in Dublin: Using a Qualitative Panel Study to Move beyond the Nation-State Container

James Wickham, Trinity College, Dublin | [jwickham@tcd.ie](mailto:jwickham@tcd.ie)

Elaine Moriarty, Trinity college, Dublin | [Elaine.moriarty@tcd.ie](mailto:Elaine.moriarty@tcd.ie)

Alicja Bobek, Trinity College, Dublin | [abobek@tcd.ie](mailto:abobek@tcd.ie)

Justyna Salamonska, Trinity College, Dublin | [salamonj@tcd.ie](mailto:salamonj@tcd.ie)

Ten years ago Wimmer and Schiller (2002) argued that migration studies should move beyond 'methodological nationalism'. The paper suggests that the use of Qualitative Panel Study (QPS) methodology is one possible response which also can link the concerns of employment studies and migration studies. Our QPS involved six waves of interviews over two years with Polish migrants who were employed in Dublin when the project began in 2007: they were re-interviewed wherever they subsequently lived with the final interviews completed in 2013. Such repeated interviews add several dimensions to conventional qualitative studies that use once-off semi-structured interviews; it illustrates these from our own data. Crucially, migrants remained in the study even if they moved across national boundaries (e.g. returned to Poland). This

enabled the identification of patterns of movement that went far beyond the traditional 'move-work-settle' pattern. Secondly, the repeated interviews allowed the construction of a detailed biography for each migrant. This contextualised their stay in Ireland in relation to their experiences and aspirations before they entered the nation-state 'container' within which the study was located. Finally, the interviews showed how migrants' own understanding of their situation changed over time, and in particular how they increasingly articulated non-economic motivations for migration. Finally, the panel study interviews traced changes in migrants' employment and working conditions as the Irish boom collapsed in 2008; the panel study enabled a contrast between migrants' experience of a 'goldrush' labour market and one in crisis.

## a08RN17 - New and Different Forms of Employment and Organisation

Chair(s): Catherine Casey (University of Leicester)

### Impact of Atypical Employment on European Demography

Andranik Melik-Tangyan (Tangian), Karlsruhe Institute of Technology | [andranik-tangian@boeckler.de](mailto:andranik-tangian@boeckler.de)

The socio-economical message is that the actually observed increasing share of atypical employment is damaging for the European demography. It is illustrated by four figures with actual trends based on statistical data 2001, 2005, and 2010; and four figures with the trends extrapolated to 2020 and 2030. All the graphs have the same independent variable • X – Atypical employment, in % of the total employment. The Figures 1–4 differ in dependent variables, which are • Y1 – Inequality, Gini-coefficient, • Y2 – Size of middle class, in the ratio of 7-9 deciles to 2-4 deciles, • Y3 – Fertility, in number of children per woman (in the lifetime), and • Y4 –

Migration, in % to the migration during the reference year 2001. It is shown with statistical certainty that the higher the share of atypical employment, the higher inequality, the smaller the middle class, the lower fertility, and the higher migration. These trends are becoming more salient, that is, these dependences are getting stronger in the control period 2001–2010 (Figures 1–4). Predictions are also made for the situation in 2020 and 2030 (Figures 5–8), showing that if the growth of atypical employment will continue as fast as now then the demographic situation in Europe will become critical by 2030.

### Towards a New Coal Worker in Industrial Relations in Tunçbilek Coal Mine, in Kütahya, Turkey: Where Have all the Solidarity Have Gone?

Sibel Kalaycıoğlu, Middle East Technical University | [ksibel@metu.edu.tr](mailto:ksibel@metu.edu.tr)

Kezban Celik, Ondokuz Mayıs University, Samsun | [kezban.celik@omu.edu.tr](mailto:kezban.celik@omu.edu.tr)

This article examines the impact of structural changes in the local, national and global dynamics on mine workers' experiences in Tunçbilek coal mine in Kütahya, Turkey. Especially the new energy crisis and pressure on energy resources together with technological transformation in the mining sector brings major influences to the experiences of coal workers. Previous sociological studies on coal workers have defined them as a homogeneous group of workers with solidaristic attitudes towards work and work friends. On the other hand, in the present global as well as in the national context scarcity of energy resources, especially natural energy resources, became a highly

economic and political issue. Such tendency created new approaches and energy policies like the ongoing privatization process of the mines in Turkey. In this context, this paper, based on a field research conducted in 2011 in Tunçbilek, Kütahya, focuses on the changing experiences of coal workers through this crisis and change. In the field research 40 workers who are still working in Tunçbilek Coal Mine are interviewed in - depth. This coal mine was operated by the state as a state owned industry from 1940s until 2000s. During the 2000s, changing legislation about mining and energy policies in Turkey, a privatization and de-nationalization process of mines has started. Tunçbilek coal mine is half way through this

process yet. Therefore, while there are still public sector workers employed by the state, it is possible to find private sector workers as well as subcontracted workers, all working

under one roof. Under these conditions of transformation of the work process and ownership status, an inner stratification and hierarchy emerged among the work

## Rent Production: A Mechanism that Explains Wage Inequalities in Flexibilized Labor Markets

**Susanne Edler**, Bielefeld University, Collaborative Research Centre 882 "From Heterogeneities to Inequalities" | [Susanne.Edler@uni-bielefeld.de](mailto:Susanne.Edler@uni-bielefeld.de)

**Andrea Hense**, Bielefeld University | [Andrea.Hense@uni-bielefeld.de](mailto:Andrea.Hense@uni-bielefeld.de)

Economic crises generate distributional conflicts which change the way how returns to economic assets are redistributed in employment relationships. Following Sørensen (2000), we test his theory of rent production and identify rent-seeking reemployment decisions of employers and employees as an inequality-generating mechanism. This theory-guided analysis explains why wage inequalities vary between employees who were dismissed and recalled by their former employer, workers who were reemployed by another firm, and employees in continuous employment relationship. Thus, it offers an analytical framework to examine flexibilized labor markets and economic consequences of discontinuous employment. We use log-linear panel models to analyze process-generated administrative data from German social security records with nearly 6.5 million observations. This shows that recalls are

beneficial for rent-seeking employers because they capture a part of the employees' composite rent from firm-specific human capital by dismissing and recalling them. Employees lose income due to unemployment and never recover the income they could have gained if they had not have been dismissed. However, employees also gain from recalls: They receive higher post-reemployment wages than employees who found another firm because former employers provide higher returns on tenure and credentials for people who wait for a recall, and thus partly redistribute their economic gains. Although employees who changed employers suffer higher short-term wage losses than recalled workers, they are able to gain higher long-term income benefits by increasing returns to general work experience. Nevertheless, the most beneficial option for employees is continuous employment.

## From Middle-Class-ing to Working-Class-ing: Crisis and Slipping Mobility in Italian Labour Market

**Stefano Poli**, Università degli Studi di Genova | [stefano.poli@unige.it](mailto:stefano.poli@unige.it)

The crisis shapes societies all over Europe, triggering mobility processes due to general socioeconomic downgrading, as well producing socio-cultural changing, for instance, modifying self class positioning. The paper explores such aspects in Italian society, where, almost since the Sixties, the labour market, acting positively as a factor of income

redistribution, has been the main economic function underlying the process of "middle-class-ing" of society (De Rita, 1996; Bagnasco, 2003; De Rita and Galdo, 2011), promoting the social encounter between the raising of condition for lower classes and the sliding of the upper classes, more and more focused on consumption and less culturally able to

influence the political and institutional decision-making. Nowadays, such "middle-class-ing" trends (interpretable partly as a failure, partly as a renounce of the bourgeoisie to lead as an effective ruling class), have shifted, due to socioeconomic difficulties, to a sort of "working-class-ing" (Diamanti, 2011) interesting an increasing part of the entrepreneurship, where many middle-small business owners feel much closer in terms of social positioning to their employees, workers or craftsmen, because they share with them

risks and uncertainty. Nonetheless, especially the working and middle class, more and more less supported by the welfare in the prolonged crisis, are suffering a progressive worsening of socioeconomic conditions. Using datasets from Banca d'Italia, the contribution observe such trends of social mobility since the beginning of the crisis in 2008, observing the evolution in income, property and consumption behaviors from the perspective of the different labour market positions.

## **b08RN17 - Corporatism, Pluralism and Changing Contexts**

Chair(s): Valeria Pulignano (Katholieke Universiteit Leuven)

### **A Neo-Pluralist Perspective on Work, Employment and Industrial Relations**

Peter Ackers, Loughborough University | [P.Ackers@lboro.ac.uk](mailto:P.Ackers@lboro.ac.uk)

Classical Industrial Relations (IR) theory in the Anglo-American tradition, from Dunlop and Kerr in the USA to Clegg and Flanders in the UK stressed a Pluralist approach to Industrial Democracy through independent trade unions and collective bargaining. Alan Fox (1966) distinguished this from a Unitarist emphasis on shared interests between employers and employees and began to develop a stronger Sociological emphasis to IR Pluralism. However, from the 1970s Fox's work took a Radical turn, which in recent years has been developed by writers such as Paul Edwards (2003) as Radical Pluralism. In a European social democratic context - very different to US IR - these debates arose out of the theoretical challenge from Marxism found in the work of writers such as Richard Hyman (1975) and

John Kelly (1998). As a result a rather Marxian consensus has settled on much European IR theory. Ackers (2001) challenged this view and suggested a Neo-Pluralist development of classical Pluralism that deepened the perspective Sociologically by returning to Durkheim's emphasis on social integration, stressed values as well as interests and focused more on conflicts between employment and society - rather than just internal to the employment relationship. At a public policy level, Neo-Pluralism was linked to a strategy of Social Partnership (Ackers & Payne 1998). This paper draws together this central IR debate, putting the case for Neo-Pluralism in the current economic and social crisis, as a social science, normative and public policy perspective.

## Sociology of Industry Revisited: Towards Re-Industrialization in Europe? Case of Poland

Krzysztof Bondyra, Adam Mickiewicz University, Poznan | [bondyra@amu.edu.pl](mailto:bondyra@amu.edu.pl)

Marta Lis, Laboratory of Change Project | [marta.irena.lis@gmail.com](mailto:marta.irena.lis@gmail.com)

At the time of crisis, the public debate stressed the importance of 'real' rather than 'virtual' grounds of economic growth. Subsequently, several dogmas on socio-economic trends have been questioned including the thesis on industrial decline. As the stereotype of 'good' economy based almost exclusively on services started to be challenged, industry re-emerged as a remedy for the crisis. While world's biggest countries are still investing in industry as one of foundations of their economies, re-industrialization has been put on the policy agenda by the European Commission in its Strategy 2020. As noted by Jeremy Rifkin third industrial revolution is approaching, its building blocks being ICT on one side and renewable energy on the other. Inevitably, it will redefine all earlier visions of industry we

held, and thus mean a change of gears for sociology of industry as well. In this context, Polish sociology of industry needs to undergo a renewal. In Poland, where industrial production constitutes a considerable share of Polish gross domestic product, reopening a debate on the role of industry for Polish economy seems to be vital for understanding the challenges Poland has to face. Supply of industrial cadre constitutes an important dimension of re-industrialization. Sadly, Poland suffers from shortages in human capital, skilled workers in particular, with vocational education having negative connotations. The presentation aims at diagnosing state of the art of Polish vocational education from the perspective of sociology of industry and challenges of re-industrialization.

## Crisis Corporatism and the Legitimation of the Political System

Wolfgang Menz, Institut fuer Sozialwissenschaftliche Forschung Muenchen, ISF Muenchen | [wolfgang.menz@isf-muenchen.de](mailto:wolfgang.menz@isf-muenchen.de)

Sarah Nies, ISF Muenchen | [sarah.nies@isf-muenchen.de](mailto:sarah.nies@isf-muenchen.de)

The relative stability of employment in the crisis 2007ff. and the following recovery of the German economy are often interpreted as a (late) success of the past German model of capitalism (coordinated market economy, strong emphasis on social partnership etc.). The so-called "crisis corporatism", the partnership between management, workers' representatives and the state during the crisis, seemingly reestablished the importance and influence of the unions and is often seen as a decisive step for the process of union revitalization. In our contribution this view is juxtaposed to the perspectives of workers' councils in the German car- and metal industry. What we found was not a revitalised

trust in the procedures of corporatist conflict management and the German political system but a profound distrust concerning not only "the politicians" but also the orthodox/traditional forms of political representation. Legitimatory claims and perceptions of justice are not violated, but suspended; the belief in apparent inevitability supersedes legitimatory claims. The unions again are in fact slightly winning reputation during the crisis – but not as a member of the political system, but rather as the last potential oppositional power to hold on to. Politics are not abandoned by the workers: in their view politics should be influenced from the outside in favour of their interests instead of "playing

the game” within the political system. Our findings are based on the empirical research project „Crisis without Conflict?“ (2010-11) and

the follow-up-study “Political Orientations and the Crisis” (2011-12) both funded by The Rosa Luxemburg Foundation, Germany.

## The Curious Case of Queensland and Wisconsin

John R Martin, Griffith University | [johnm@qcu.asn.au](mailto:johnm@qcu.asn.au)

In Australia, as in the United States, a number of conservative state (provincial) governments have recently been elected. Particularly in Australia, these governments have come to power over issues other than the prevailing economic conditions. However, these newly elected state governments have made economic reform their first priority and have especially attacked collective bargaining rights and job security of public sector workers and their unions. In all cases, supposedly independent inquiries are established to create a sense of urgency and despair surrounding the financial circumstances of the state thereby justifying an attack on collective bargaining and other rights (Quiggin 2012; Walker and Con Walker 2012). 17 states in the United States, most notably Wisconsin and Ohio elected conservative Governments with an agenda to attack public sector workers. Measures introduced by newly elected state government in the US, purportedly justified by the global financial crisis included: • Removal of provisions in collective agreement concerning privatisation and/or contracting out; • Limiting bargaining outcomes to the Consumer Price Index on base rates only; • Restricting the scope of matters about which bargaining can occur; • Restricting fact-finding to the Government’s financial situation; • Unilateral imposition of the Government’s preferred offer; • Attacking pension funds; • Restricting unions’ political activity; • Limiting collective bargaining rights for certain categories of employees; and • Onerous voting requirements for union recognition. (Slater 2012a:206, 207; Slater 2012b: 482, 483, 486, 489 Malin 2012:150, 155, 156, 157; Secunda 2012:2, 8,9) What is most remarkable is the

similarity of the measures described above with that of the measures adopted by conservative state governments in Australia most notably Queensland and New South Wales. The paper seeks to answer the question as to why this remarkable similarity exists. In so doing, the author will apply a comparative analysis between the Wisconsin in the United States and Queensland in Australia. The conclusion drawn is that public sector unionism represents the bulwark of the union movement both in Australia and the United States. It is postulated that the attacks on public sector workers and their unions is the politically partisan motive of removing the support base for parties of the left and/or centre that stand in the way of the complete hegemony of the neo-liberal agenda. ## **a09RN17 - Work, Employment and Industrial Relations in Times of Crisis**

Chair(s): James Wickham (Trinity College, Dublin)

### **Industrial Relations in Hard Times: Irish Trade Union Faces in the 'Great Recession'**

John F Geary, University College, Dublin | [john.geary@ucd.ie](mailto:john.geary@ucd.ie)

The Irish economy was one of the worst affected by the international financial crisis. The response of the Government has been to impose wage reductions, increase taxes, and cuts in welfare and public service provision, as well as re-forming the delivery of public services. Private sector employers have sought to pressurise the Government to dismantle

wage settlement mechanisms in low wage sectors. Yet, unlike some other European economies, Irish unions and workers have not engaged in widespread civic protest or militant industrial action. The paper seeks to account for this largely compliant, but yet complex and contradictory, union posture.

### **The Uneven Impact of the 2008-09 Economic Crisis on Industrial Regions: Comparing Western and Central/Eastern European Auto Agglomerations**

Andrew J Jacobs, East Carolina University | [drajjacobs@yahoo.com](mailto:drajjacobs@yahoo.com)

This paper examines the uneven impacts of the 2008-2009 Economic Crisis on motor vehicle production regions in Europe. Since 2008, whereas output and jobs in traditional regions in Europe has contracted noticeably, auto production has expanded in the former Socialist nations of Central and Eastern Europe (CEE). The World's largest automakers and their suppliers have been attracted to the CEE by its skilled, but relatively inexpensive, labor force. The central locations of these nations also made them prime export bases to ship vehicles to both emerging and developed European

markets. Guided by the theories of Stephen Hymer and others, and comparing Italy and Belgium with the Czech Republic and Slovakia, this paper shows how the economic crisis, although not the cause, accelerated the shift in auto production from developed European markets to emerging CEE regions. In the process, it also discusses how many regional economies in Western Europe have remained, and in the CEE have become, overly dependent on giant multinational corporations and/or on foreign direct investment.

## Partnership among Stakeholders as a Vehicle for Coping with Employment Crisis: The Case of College Graduates' with Learning Disabilities Transitions from Academia to Job Market

Helena Desivilya Syna, The Max Stern Academic College of Emek Yezreel | [desiv@yvc.ac.il](mailto:desiv@yvc.ac.il)

Amit Rottman, The Max Stern Academic College of Emek Yezreel | [amit.rottman@gmail.com](mailto:amit.rottman@gmail.com)

Michal Raz, The Max Stern Academic College of Emek Yezreel | [michalr@yvc.ac.il](mailto:michalr@yvc.ac.il)

The contemporary reality demonstrates a growing crisis in employment conditions world-wide in particular for excluded populations. Recent years reveal marked changes in patterns of social services provided to such social groups, the major one purporting to the division of responsibilities among organizational sectors: granting a much greater mandate to the private and third sectors and limiting the duty of governments. Such a transition leads to fragmented social services delivery. The literature and empirical evidence suggest that a systems approach can potentially alleviate the adverse consequences of changes in employment-related social services. Building partnerships among various organizational sectors appears an effective mechanism in addressing this issue. The current article focuses on inter-organizational partnership as a mechanism aimed at facilitating the engagement with employment

crisis, especially for excluded social groups. We attempt to illuminate the potential contribution of such a vehicle through a case study of an innovative program designed to integrate college graduates with learning disabilities in the job market. Based on insights drawn from an evaluation research (conducted by the authors) which followed up the novel project, we propose a model of action intended to enhance the intra and inter-organizational practices for facilitating the assimilation of employees with learning disabilities and other excluded social groups at the work arena. Processes of building a genuine partnership among a network of stakeholders, such as academics, practitioners, program participants, employers, governmental institutions and non-governmental organizations, constitute the core of this conceptual framework.

## Economic Crises and Labour Trajectories in UK and Spain

Martí López-Andreu, University of Manchester | [marti.lopez@uab.cat](mailto:marti.lopez@uab.cat)

The paper presents the first results of an ongoing research founded by the Marie Curie IEF research program and aims to define and characterise labour trajectories before and after the economic recession of 2007 in Spain and UK. These countries have been classified in different typologies in terms of varieties of capitalism and welfare regimes. But they show some common tendencies in terms of discontinuity and external flexibility of labour trajectories for some segments of the labour market. The UK shows a flexible labour market based on short-term flexible jobs for those

under 25 years old, a high degree of integration into employment for most adults, and comparatively low unemployment levels. Segmentation in the labour market is derived from part-time, wage differentials and interruptions to employment. The Spanish labour market is extremely flexible as well as segmented. It shows high rates of temporary employment since the middle of the 1980s, and records high unemployment rates depending on the economic context, being currently up to 20%. The paper presents quantitative trajectories based in employment transitions

using the Source of Income Living Conditions (SILC) data before and after "economic recession". These will allow social and employment profiles to be defined in the two periods and identify main collectives (in terms of personal, social and employment

characteristics) affected by a change in trajectories (and in which the recession has been a "turning point"). The social and employment profiles identified will be the basis for biographical interviews in the second phase of the research.

## **b09RN17 - New Alliances, Reorganisation Processes and Negotiations**

Chair(s): Mirella Baglioni (University of Parma)

### **Interest Representation along the Automotive Value Chain**

Volker Telljohann, IRES Emilia-Romagna | [volker\\_telljohann@er.cgil.it](mailto:volker_telljohann@er.cgil.it)

Since the early 1990's, there has been a general trend in corporate restructuring towards outsourcing of tasks. These processes have consequences for employment levels and working conditions. At the level of industrial relations these processes have entailed a vertical disintegration of MNEs contributing to the disorganisation of in-plant and sectoral negotiations. New organisational boundaries across the production chain are introduced disrupting traditional structures of interest representation. Often the fragmentation of structures of interest representation has a negative impact on processes of information, consultation and participation. Against the background of increasing outsourcing processes and the consequent tendencies of decomposition of sectors and companies one of the main challenges for trade unions consists in overcoming the fragmentation of

employee representation. Thus, in recent years in different sectors and countries employee representatives and trade unions have started to develop new approaches in order to establish representation across the boundaries of firms and sectors. An example are Transnational Company Agreements (TCAs) that represent a strategy at transnational level to strengthen working conditions and rights of interest representation. With regard to contents and scope we find all types of TCAs in MNEs belonging to the automotive value chain. With regard to the re-building of coordinated interest representation TCAs that have to be applied also by the supply companies are of particular interest. The paper will present the results of a research project carried out in 2011/12 in five countries on the role of TCAs with regard to the re-building of coordinated interest representation.

### **Climate Change and Employment in EU – Toward a Cooperative Alliance between Trade Unions and Social Movements?**

Carsten Strøby Jensen, University of Copenhagen | [csj@soc.ku.dk](mailto:csj@soc.ku.dk)

The research questions asked in this paper is whether trade unions have shown signs of linking up with new types of political and social alliances in the context of climate change

discussion. Can we identify alliances between trade unions and green social movements established in order to influence the climate change agenda. It can be argued that trade

unions are increasingly relating to climate change problems since various forms of climate policy initiatives are likely to imply major changes in the occupational and employment structure. In Europe it is possible to observe a growing interest among trade unions in the climate change debate. This is related to subjects like 'the creation of green jobs', 'reduction of CO2 emission at workplaces', 'sustainable production' etc.. The possibility for establishing alliances between trade unions and different environmental organizations can theoretically be understood and related to theories about formation of coalitions Obach 2004; Bacharach & Lawler

1980; Turner and Hurd 2001). Another key theoretical issue related to the relationship between trade unions and social movements is rooted in the various theories of social movements. Some of the literature on social movements distinguishes between different types or generations of social movements (Melucci 1996, Obach 2004, Mayer et al. 2010). Preliminary results from the analysis points in the direction, that alliances between trade unions and green social movements are most developed in contexts, where trade unions have lost influence power and influence (e.g. have experience decline in membership).

## Employee Participation, Job Satisfaction and Organisational Commitment in Russia: Is there a Connection?

**Evgeniya Balabanova**, National Research University - Higher School of Economics | [balabanova@hse.ru](mailto:balabanova@hse.ru)

**Azer Efendiev**, National Research University - Higher School of Economics | [azef@akado.ru](mailto:azef@akado.ru)

In our report we are going to consider two aspects of employee participation: 1) organisational and individual factors of participation and its effectiveness; 2) participation as a predictor of employees' work-related attitudes. Our empirical data include 623 white-collar workers ("specialists") and managers (employees having subordinates) in 17 private-owned Russian organisations surveyed in 2012. Data analysis included crosstabulations, one-way ANOVA, regression models and resulted with the following findings. • Managers show much higher rates of individual participation than employees without subordinates. • Location of organisations in regions (as opposed to Moscow) is positive predictor for both specialists' and managers' political participation. • For specialists, men show considerably higher rates of individual participation than women. • Foreign ownership

is the only significant predictor for both specialists' and managers' Organisational Democracy rates. • The highest rates of Organisational Authoritarianism index are revealed among domestic-owned companies, organisations located in Moscow and industrial enterprises. • While Organisational Democracy rates do not predict work-related attitudes, Organisational Authoritarianism considerably reduces both specialists' and managers' job satisfaction, reduces specialists' affective commitment to organisation and raises their intentions to leave. This points to the fact that, having in common low priority of participation values, Russian employees are much more sensitive towards negative "authoritarian" organisational practices (negative individual participation experiences) than towards positive "democratic" incentives for participation.

## Examining Equity Theory Constructs in Romanian Cultural Context

Carmen Buzea, Transilvania University of Brasov | [carmen.buzea@unitbv.ro](mailto:carmen.buzea@unitbv.ro)

The paper examines J. S. Adams' equity theory constructs (inputs, outcomes, referent other, and inequity) in Romanian cultural context, during the nowadays economic crisis. We aim to answer four questions: How do Romanian employees define inputs (i.e., contribution for which is fair to be rewarded)? How do Romanian employees define outcomes (i.e., fair rewards for contribution)? Which is the dominant reference group used for comparing the equity of inputs-outcomes ratio? What is the dominant strategy to reduce inequity? Using a qualitative approach, 84 individual interviews, and 3 focus groups have been conducted with Romanian employees. As expected, although there is individual variation, a pattern regarding the definition of the investigated constructs has been registered. Respondents believe that the main contributions for which they should be

rewarded are: (1) personal characteristics (as intelligence, seriousness or being a reliable person); (2) work effort and (3) technical skills. Regarding the outcomes, it was found that during the economic crisis, the non-financial reward, mainly feedback and the relationship with co-workers have similar importance as financial reward or job security. The preferred strategy to reduce inequity is to distort cognitively inputs and outcomes, mainly by under-valuing the inputs. The reference group includes co-workers and respondents themselves in past or future work contexts. It was found a significant reluctance of Romanian employees to compare themselves with others. These results might be useful for a better understanding of current changes regarding the employee-employer relation in order to (re)design reward strategies and develop motivation and retention policies.

## c09RN17 - Sectoral Employment Relations

Chair(s): Bernd Brandl (University of York)

### Can Sector Differences in Working Conditions Be Explained by How Work Is Organized?

Malin Bolin, Mid Sweden University | [malin.bolin@miun.se](mailto:malin.bolin@miun.se)

Background: New forms of organization have a central role in the general change of the neoliberal welfare state. Still, little is known about how workplaces actually are organized and what impact it has on employee working conditions. In an earlier study, different types of organization were identified in workplaces in Sweden. These were unevenly distributed between sectors in the labor market. Therefore, it was tested whether the identified types of organization contribute to sector differences in working conditions. In this study

only women are included as the gender-segregated labor market in Sweden makes it problematic to differ between sector and gender. Method: Data from the WOLF study was used including 69 workplaces and 1047 women in Mid-Sweden. The impact of five types of organization on several aspects of psychosocial working conditions was tested with multilevel analysis. Each outcome was analyzed separately and controlled for age and socioeconomic position of employees and type of sector of workplaces. Interaction between

sector and type of organization was also included in the analysis. Results: Type of organization at workplaces could partly explain sector differences in role conflict, job demands, job control, social support,

psychosocial climate, and work over commitment. Conclusion: How work is organized at workplaces contributes to differences in working conditions between sectors.

## De-Regulating Work and Employment in English Agriculture

**Stephanie A Tailby**, University of the West of England, Bristol | [Stephanie.Tailby@uwe.ac.uk](mailto:Stephanie.Tailby@uwe.ac.uk)

**Andy Danford**, University of the West of England, Bristol | [Andrew.Danford@uwe.ac.uk](mailto:Andrew.Danford@uwe.ac.uk)

**Stella Warren**, University of the West of England, Bristol | [Stella.Warren@uwe.ac.uk](mailto:Stella.Warren@uwe.ac.uk)

The Agricultural Wages Board (AWB) for England and Wales comprises worker and employer representatives and independent members. Since 1948 it has had statutory duty to set a minimum wage rate and discretion to set other terms and conditions. The current Order (AWO) provides for six grades, defines the qualifications and sets a minimum pay rate for each, regulates working time, paid overtime and sick pay among other matters. It directly covers 150,000 workers and has been the reference point for pay and conditions in rural employments beyond farming. The AWB survived the Conservative government's abolition of the Wages Council system of minimum pay protection in 1993. The current Coalition government favours labour market deregulation in pursuit of economic recovery and announced AWB abolition in July 2010. It claims modern communications and transport

redress farm workers' isolation and employer dependence; modern employment protection law (which it is eroding) renders the AWB redundant; and that the AWO is burdensome administratively for farming business, particular that which is diversified beyond 'mainstream' agriculture. In tension with this is its claim that a dual National Minimum Wage and AWO regime deters vertical integration in the food supply chain. Our paper draws on interviews with farm workers, farming employers, officials from their representation bodies, and a survey of farming employers in south west England to interrogate the government's claims, show employers' support for AWB abolition is highly uneven and that aside from climatic conditions and animal disease, the most prominent concern is supermarket power through the supply-chain.

## De-Democratization of Industrial Relations in the Global Enclaves of Agricultural Production

**Carlos d de Castro**, University Autonomous of Madrid | [c.decastro@uam.es](mailto:c.decastro@uam.es)

**Héctor Romero**, University of Murcia | [hromero@um.es](mailto:hromero@um.es)

**Marta Latorre**, University of Murcia | [mlatorre@um.es](mailto:mlatorre@um.es)

**Germán Carrillo**, University of Murcia | [gcarrillo@um.es](mailto:gcarrillo@um.es)

LA DESDEMOCRATIZACIÓN DE LAS RELACIONES LABORALES EN LOS ENCLAVES GLOBALES DE PRODUCCIÓN AGRÍCOLA This paper maintains, first, that a specific standard

of employment are setting in the new global agricultural production enclaves and, second, that the consolidation of this standard of employment is weakening the link between

work and citizenship. In order to prove it, this paper intend to give a description of the main features of working conditions of various enclaves of agricultural production in Spain and Latin America: a high degree of informal work, high seasonality of work, intensive and irregular working days, low wages, absence of

collective bargaining and extreme flexibility that threatened social reproduction conditions for workers. Under these circumstances the agricultural workers of the new enclaves have greater difficulty in accessing social rights related to work and lack of a minimum degree of control over their working conditions.

## **Balancing the Tension Field between Emancipation and Control: Belgian Third Sector Organizations (TSOs) Functioning under the Prevailing Modes of Governing Welfare**

Els De Waele, Ghent University | [els.dewaele@ugent.be](mailto:els.dewaele@ugent.be)

Lesley Hustinx, Ghent University | [lesley.hustinx@ugent.be](mailto:lesley.hustinx@ugent.be)

Since the last decades of the 20th century modern welfare states are changing. With society becoming more complex, and with the emergence of new economic and social conditions, a transition from welfare to workfare, and a shift from government to governance took place. In Belgium, these trends have led to a complex mix of neoliberal and neocommunitarian modes of governance. Due to processes of devolution, TSOs are forced to take responsibility for social problems. At the same time they are mobilized in activation practices for welfare clients and other vulnerable groups in society. These tendencies bring along hybrid labor forces within TSOs, consisting of, among others, paid staff, volunteers, and welfare-to-workfare clients. Little is known about how and with which consequences the concrete practice of TSOs takes shape under these conditions; making this the focus of the paper. The

empirical findings are based on eight months of participant observation in a purposively sampled TSO, which delivers social services to people living in poverty and employment reintegration services to long term unemployed persons. Supplementary interviews were conducted. Preliminary results show the professional staff of the TSO struggling with a tension field between personal growth of the volunteers and the clients in an employment activation trajectory on the one hand, and organizational functioning on the other. We argue this tension field reflects the prevailing modes of governance under which the TSO functions. The link between this tension field in the concrete practice of the TSO and the macro level conditions will be analyzed from a Foucauldian governmentality perspective. Wider implications for social policy will be discussed.

## a10RN17 - Changing Industrial Relations

Chair(s): Alessia Vatta (University of Trieste)

### IR: Between Survival and Adaptation

Mirella Baglioni, University of Parma | [mirella.baglioni@unipr.it](mailto:mirella.baglioni@unipr.it)

Francesco Garibaldo, Research Committee ISA | [fgaribaldo@gmail.com](mailto:fgaribaldo@gmail.com)

The paper deals with the changes experienced by Italian IR during the new millennium. The changes herein considered result from a double pressure: the crisis and the governmental initiatives of socio-economic regulation. While the crisis impacted on employment, the governmental initiatives impacted on the legitimacy of social partners and on the autonomy of collective bargaining.

The focus of this analysis is on the responses given by collective actors to the above challenges: adaptive practices in their organizations and the initiatives of reforming collective bargaining. The final part of the paper critically analyzes the uncertainties surrounding the present phase of Italian IR in a comparative perspective.

### On the 'Systemization' of Industrial Relations: From the Concept of System to That of Region

Guy Bellemare, Université du Québec en Outaouais | [guy.bellemare@uqo.ca](mailto:guy.bellemare@uqo.ca)

Louise Briand, Université du Québec en Outaouais | [louise.briand@uqo.ca](mailto:louise.briand@uqo.ca)

This paper presents a dynamic approach to the definition of work, actors and work relations regions that allow us to grasp the complex and shifting nature of contemporary industrial relations. We propose concepts that can help track the changing empiric boundaries of industrial relations, as well as explain and influence the development of the academic field of industrial relations. The need for renewal of the field of study of industrial relations can be exemplified by Kaufman's (2004a) and Hyman's (2004) critiques that these subjects are poorly defined and that the 'universal' models developed are, in fact, ethnocentric and anachronistic. To respond to critics and make it possible to grasp new social phenomena, we propose to incorporate the concepts of 'region' and 'regionalization', in their accepted structurationist meanings, into the analysis of industrial relations. (Giddens

1984); we will argue that an industrial relations system should constitute both the conditions for, and the results of, the interaction of actors in the field of work and that neither actors nor contexts can be totally circumscribed a priori, since they are defined through their interaction. We first identify a number of the work-related transformations that are taking place and the challenges they represent, and we describe a new logical concept for defining industrial relations. We then outline the main points of Giddens's theories of structuration and late modernity. Next, we discuss the concepts of region and regionalization, present an analysis framework and explain why they are relevant to rethinking industrial relations, taking elements of a case study of the unionization of child-care workers to provide an illustration of how it works

## Meadow (Measuring the Dynamics of Organisation and Work) – Researching Context and Consequences of Organisational Reforms with New Kind of Data

Simo Aho, University of Tampere | [simo.aho@uta.fi](mailto:simo.aho@uta.fi)

Meadow (Measuring the Dynamics of Organisation and Work) is a survey tool to gather information on organisational change and its economic and social impacts, developed with EU funding and aiming at internationally harmonised data for comparative studies. The leading idea is to gather linked data both from employers and employees of same firms and organisations. The sample should represent private sector firms in various industries and also public sector organisations. (See [www.meadow-project.eu](http://www.meadow-project.eu)) Thus far, MEADOW-projects have been started in Denmark,

Finland, Norway and Sweden. In Finland, extensive employer (n=1561) and employee (n=1711) data has been gathered with telephone interviews carried out by Statistics Finland, and the analysis of data is going on. The project is funded by Finnish Funding Agency for Technology and Innovation for 2012-2013. In this paper, the goals and contents of the MEADOW concept will be presented, as well as some preliminary results based on Finnish data. The focus will be to investigate the incidence, context and consequences of organisational reforms.

## The Portuguese Industrial Relations Agenda: Towards a Dead End?

Hermes Augusto Costa, University of Coimbra | [hermes@fe.uc.pt](mailto:hermes@fe.uc.pt)

In the last two decades of the twentieth century, the agenda of industrial relations in Portugal was ruled by topics such as industrial action in enterprises, participation and democratization, institutionalization of social dialogue, increase of social rights. It was undoubtedly an "ascending" agenda. Moreover, at the turn of the millennium the role of the state in regulating conflicts, globalization and participation, employment and skills, flexibility and working time(s) were themes that marked the calendar. This "independent" agenda of industrial relations is now being increasingly replaced by an "imposed" agenda, typical of an "age of austerity". Unemployment, job insecurity, the precariat, inequality and poverty are elements of that agenda. The Portuguese employment system, labor relations and its actors (especially trade unions) have strongly

felt the impact of the austerity measures. Employers seem more willing to accept austerity because it comes as an opportunity to safeguard their positions. However, trade unions agenda seems placed in a straitjacket, with unions challenged to: i) address the trends of individualization of labor relations that the crisis is gathering pace; reduce the power of the trade unions in collective bargaining; ii) resist to the weakening of their power in collective bargaining (which is undeniable in documents such as the Memorandum of Understanding with the Troika (May 2011), the Social Concertation Agreement (January 2012) and the revision of labor legislation (August 2012); iii) safeguarding the rights and duties regulated by collective bargaining.

## b10RN17 - The Nature and Characteristics of Work and Employment

Chair(s): Alex Lehr (Radboud University, Nijmegen)

### What Is Work?

David Bartram, University of Leicester | [d.bartram@le.ac.uk](mailto:d.bartram@le.ac.uk)

Contributors to the sociology of work seldom say what work is, perhaps relying on a taken-for-granted understanding. That understanding is (usually) no longer limited to paid employment, as social scientists know that such a definition overlooks or devalues the work done mainly by women in the home; it also fails to capture informal sector and voluntary work. But a critique of older/narrower definitions (rooted in an appreciation for the need to capture a wider range of forms) has not yet been convincingly accompanied by a more comprehensive 'positive' definition. This paper argues for a definition rooted in the \*value\* created by work; if an activity creates value, then it likely merits designation as 'work'. That approach to definition by no means answers all the questions we might raise about work; instead,

its utility consists in the way it forces us to confront those questions (when normally they are elided, especially in public discourse, by a 'market fundamentalism'). In particular, it compels to ask: what do we value, and how is value to be recognized and rewarded beyond market exchange? The discussion builds on analysis of two groups whose activities have at best a tenuous connection to conventional notions of work: Israeli ultra-Orthodox Jewish men (engaged mainly in full-time Torah study, not paid employment) and French farmers, whose incomes derive more from public subsidy than from success in economic markets. The elements of their situations that seem distinctive are found in fact to be quite pervasive, even for activities that are 'obviously' work.

### Steady Work in a Shifting Society

Heikki Huilaja, University of Lapland | [heikki.huilaja@ulapland.fi](mailto:heikki.huilaja@ulapland.fi)

Jarno Valkonen, University of Lapland | [jarno.valkonen@ulapland.fi](mailto:jarno.valkonen@ulapland.fi)

Saara Koikkalainen, University of Lapland | [saara.koikkalainen@ulapland.fi](mailto:saara.koikkalainen@ulapland.fi)

The Steady Work project focuses on increased labour mobility, one of the changes currently affecting labour markets globally. The main objective of the project is to examine how individual labour market agency reproduces the stability of work and ensures the continuity of everyday life. Depending on the circumstances, this agency may involve either mobility in search of better employment opportunities or stability and adaptation to changing situations. Research in the field of work and labour markets since the 1990's has concluded that the nature and structures of

work and employment have changed dramatically. Some of these changes are seen as irreversible. Work has become unpredictable, insecure, flexible, temporary, atypical, mobile and subjective. However, in the Steady Work project we suggest that work itself is one of the most permanent social structures of everyday life. Work shapes everyday social conventions and roles more than any other existing practice. The study uses three empirical case studies to shed light on a particular form of labour mobility currently taking place in Scandinavia: A. Care

work: The nursing sector represents a form of mostly female temporary and circular transnational mobility across borders, B. Agribusiness: The wild berry sector represents a form of seasonal, temporary migration from the Global South to the Global North, and C. Industry: mobility in the mining sector is

largely male and takes place in a global network of particular geographical locations with mining activity. This presentation introduces the three case studies and explains the societal levels in which the research examines the questions of continuity and irregularity of work and its consequences.

## Re-Establishing the Work-Nature Link

**Antti Kasvio**, Finnish Institute of Occupational Health | [antti.kasvio@ttl.fi](mailto:antti.kasvio@ttl.fi)

Enlightenment saw work as a means of human emancipation. With the help of knowledge humans would be able to submit the forces of nature to serve their needs so that in future humankind could become free from all material scarcities. Simultaneously work would transform from a daily necessity to free human self-expression. Social scientific work research has adopted this vision which it has tried to promote through its own activities. This tradition has, however, neglected the character of human labour as a metabolic process between humans and their natural environment which was still strongly emphasized by Marx. In our times the Enlightenment's vision about the future of work has turned into its opposite. The continuing expansion of human labour does not liberate us from further material scarcities; on the contrary, we are moving towards an era in

which even the most fundamental preconditions of human wellbeing like food and water are becoming increasingly scarce. And instead of liberating ourselves from the chains of work we are getting increasingly enslaved by this activity in the conditions of tightening global job competition. This is a time when social scientific work research must update its visions about the emancipatory potential of human labour. Especially important is to bring nature back to our reflections about the developmental dynamics of modern institutions and cultures of work. This paper will present the starting points for a new research project which aims to examine systematically the changing understandings of nature – both external and that of humans themselves – in the modern social scientific work research tradition.

## Understanding the Relationship between Trade Union Membership and Collective Bargaining in 14 European Countries

**Maarten Van Klaveren**, University of Amsterdam | [k.g.tijdens@uva.nl](mailto:k.g.tijdens@uva.nl)

**Maarten Van Klaveren**, University of Amsterdam | [m.vanklaveren@uva.nl](mailto:m.vanklaveren@uva.nl)

Negotiating collective agreements is an important task of the trade unions, if not their most important task. Against this backdrop, a close relationship may be expected between trade union membership and collective bargaining coverage. Studies of collective bargaining coverage, particularly those from the US and the UK, usually relate trade union

membership to bargaining coverage because their industrial relations systems are characterized by firm-level bargaining. Union membership and bargaining levels vary greatly across countries, therefore trade union membership may not be the only indicator for collective bargaining coverage. To explore the relationship between trade union membership

and collective bargaining coverage, the data of the WageIndicator web-survey on work and wages allow for analyses previously not possible due to a lack of multi-country individual survey data. Pooling the data of 2010, 2011, and 2012, we had sufficient data to focus on 14 European countries (N= 137,236). As expected, correlations between trade union membership and collective bargaining

coverage vary widely, ranging from Belgium ( $r=.03$ ) to Slovakia ( $r=.42$ ). Using multivariate models, our findings reveal a large effect of trade union membership on bargaining coverage for Czech Republic, Poland, and Slovakia, whereas a small effect is found for Belgium, Italy, and Sweden. Denmark, Finland, Germany, Hungary, Netherlands, Portugal, Spain, United Kingdom are in between.

## RN17 - Poster Session

### How to Interest Employees in Something in Which They Have No Interest? The Communication Managed by the European Works Council of a French Public Company

Denis J. Monneuse, University Paris I-Sorbonne | [denismonneuse@gmail.com](mailto:denismonneuse@gmail.com)

According to certain scholars, EWCs can be considered as 'social UFOs' (Teissier and al., 2009) insofar as these institutions are still seeking themselves (Patriarka, and Welz, 2008). Moreover, the articulation between the European and the national (local) union levels are to be reinforced (Pulignano, 2005). Hence, to what extent can the EWC's activities be reported to the whole of their employees? This paper presents a case study research conducted at a French public company. For its part, EWC management used to publish a magazine devoted to European industrial relations. Its goal was to lend substance to the internationalization process the firm was leading. However, this company focuses more on achieving international scale nowadays to enhance international agreements on topics such as corporate social responsibility. From now on, the European level is in the

background of global and local industrial relations. As for employee representatives, embarrassment is observed. On the one hand, affected by the crisis, employees are mostly concerned about their local plant's future. On the other hand, EWC's delegates are suspected by their fellow members of being out of touch with reality, due to their meetings taking place in luxurious hotels abroad. Furthermore, given EWC's activities bring no payback in electoral terms, they are seldom reported by trade unions. Therefore, a paradox appears: whereas local workers' representatives complain about their inability to negotiate with decision-makers, the EWC's employee representatives, who benefit from close relationships with top executives, have become increasingly frustrated. In spite of their efforts to communicate, nobody listens to them!

### Specialist-Employee as an Old Actor of Industrial Relations at Crisis Time

Victoria Khurtina, Peoples' Friendship University of Russia | [viktorija\\_1982@front.ru](mailto:viktorija_1982@front.ru)

All Russian specialist-employees segmented in 6 groups depending on the skill level (high -

professionals and average - technicians and associate professionals) and age (less than 30, 31 – 45, more than 45) were examined for their self-appraisal in the sphere of industrial relations. Present time the most vulnerable group of specialist-employees in Russia is the group of technicians and associate professionals whose age is more than 45 years. These employees mostly have specialized secondary education (50,3%). Only 29,4% of them have higher education, as opposed to technicians and associate professionals whose age is less than 45 years and every second of whom have higher education. 71% of technicians and associate professionals whose age is more than 45 years

describe their skill level as high and 26% of them describe it as average. Professionals of the same age characterize their skill level as high at 84% and as average at 15%. Technicians and associate professionals at mature age (more than 45) are prone to fear of job loss (61% of them) more than other groups of professionals and technicians, associate professionals. At last, the level of confidence in the fact, that they can find the job not worse they have at the moment, is the minimal between the technicians and associate professionals whose age is more than 45 years as compared with other age group of professionals and technicians, associate professionals.

## **Crisis Management Measures as a Factor of Developing New Segments of Population Employment**

**Nina M Arsentyeva**, Institute of Economics & Industrial Engineering, Siberian Branch of Russian Academy of Science | [ars@ieie.nsc.ru](mailto:ars@ieie.nsc.ru)

The economic crisis affects most negatively the main characteristics of labour power and population employment. At the Russian labour market the influence of the crisis intensifies the disprofessionalization and disqualification of a worker, and increases the number of the unemployed. The negative changes that are characteristic of the Russian labour market become more apparent in the rural area. Peculiar to the modern rural labour market are the following features: narrow sphere of labour application, low quality of workplaces and of labour power, high level of real and registered unemployment. Practically everywhere the rural unemployment is chronic and stagnant. The economic crisis has aggravated the existing problems, which manifests itself in a further increase of

unemployment and tension at the labour market, in a slowdown of workplace creation, an increase of concealed unemployment, and in a rise of accrued payroll. In the existing situation, worthy of notice is the discussion of such transformations in the complex of social policy measures that can ease the tension at the labour market by creating new working places. The federal program of additional measures to ease the tension at the labour market being taken to eliminate the negative consequences of the economic crisis suggests a whole series of these measures. Among these, the support of small business and of self-employment as well as assistance to the unemployed in opening one's own business are worthy of particular attention.

## RN18 - Sociology of Communications and Media Research

### 01JS06JS18 - Critical Political Economy of the Media and Communications in Times of Capitalist Crisis and Change

Chair(s): Ian Bruff (University of Manchester), Christian Fuchs (University of Westminster)

#### Strategies of Perpetuation. How Economic Imaginaries Are Maintained in Public Discourse

Amelie Kutter, Lancaster University | [a.kutter@lancaster.ac.uk](mailto:a.kutter@lancaster.ac.uk)

The North-Atlantic financial crisis has challenged many taken-for granted assumptions about the functioning of economies. It raised expectations that paradigmatic or regime shift might take hold, replacing finance-oriented accumulation and neoliberalism. However, the arrangements of crisis management have, so far, perpetuated the established economic formation. The paper explores what part public crisis representations played in the restoration. It starts from the assumption that crisis narratives are crucial in reducing the disorienting complexity of encompassing economic crisis (Hay 1999, Jessop 2012) and develops a framework for the critical discourse analysis of such complexity reduction. It examines crisis narratives developed by well-reputed commentators in the German financial press during the years 2006-2010. Three

strategies of perpetuation prevail: causal stories that shift explanations of the crisis from the structural to the individual and vice-versa in a way which avoids systemic readings of crisis as well as attribution of responsibility to financial actors (blame deflection); a debate on regulatory policy re-emphasising notions of a 'strong' state while at the same time slating the 'big' engaging state (substitute debate); and the crowding-out of voices that refer to other traditions of economic thought (German model, corporatism, socio-ecological renewal) by a generalising portrayal as populist and misled (silencing). These strategies allow commentators to maintain the accustomed view of the "liberal regulator" against neo-mercantilist policies introduced by the German government and popular critique of unfair burden-sharing.

#### Ideologies of Innovation: Intellectual Property Rights and Information Communications Technology

Daniel R McCarthy, University of Sussex | [dm322@sussex.ac.uk](mailto:dm322@sussex.ac.uk)

Discourses of technological innovation heavily emphasize the centrality of market pressures in driving innovation forward. Markets, in these narratives, are viewed as central to providing incentives for innovation – market-based opportunities – or for providing a necessity for

innovation – market-based compulsion. These formulations occur both amongst policymakers and in the wider scholarship on innovation, including Marxist accounts of innovation (Brenner 1998, 2002; Warren 1980; Wood 2002). This article will seek to unpack these

arguments through an examination of the discourses of the US Department of State and Department of Commerce in relation to innovation and information communications technology. The United States has repeatedly emphasized the centrality of market-based innovation for the successful growth and diffusion of the Internet. Relying on an ahistorical account of the growth of ICTs, and drawing upon many normative discursive resources that resonate in liberal international society, this rhetorical strategy has served to undermine alternative approaches to innovation as outdated or misguided. The

result is a set of arguments suggesting the necessity of private property rights in ICTs for innovation to take place. Pulling apart these accounts to examine their highly ideological nature, I will suggest that these formulations obscure the central role of cooperation and the socialization of innovation for ICTs. This suggests that Marxist accounts of innovation require substantial revision. Central to these revisions is consideration of the politics of innovation, the role of the State, and the International in making innovation in information technology possible.

## Corporeality of Work in Cognitive Industries: The Quantified Man

Phoebe V Moore, Middlesex University, London | [pvm.doc@gmail.com](mailto:pvm.doc@gmail.com)

The accelerated atomisation of 'employability' (Moore 2010, 2011, 2012) is exacerbated by a new range of self-imposed post- post-Fordist self-management techniques seen in the Quantified Self movement. Softwares developed out of this movement such as sensecams, automas, memoto and such projects as the Citizen Evolutionary Process Organism (C3PO) used for lifelogging and self tracking are fully cognizant of the body in work in the virtual industries, but only as oriented around accelerated productivity and fail to acknowledge exploitative aspects of attempts

to track non-commodity value producing labour. A reliance on the binarism of the body and the mind prevents the full investigation of the ideological implications of populist management literature and reflects the reliance on Cartesian thinking in humanities and social sciences. This paper provides a reminder that new materialism, and the Corporeal Turn and the Affective Turns taken in a variety of academic disciplines have increasing relevance as management seeks to appropriate measures for creative virtual work.

## Peer Production, Communism, Rent, and Commons of knowledge

Jakob Rigi, Central European University | [rigij@ceu.hu](mailto:rigij@ceu.hu)

This paper deals with the contradiction between the emancipating potential of peer production, on the one hand, and the fact that some instances of peer production, though not all of them, are used by major corporations to extract rent. It argues that peer production in itself, abstracted from its capitalist environment, constitutes the germs of an advanced communist mode of production, described by Marx in the Critique of Gotha Program. On the other hand, giant companies

such as IBM and Facebook contribute to peer production, because the use of peer produced commons enable them to extract rent. Therefore, under capitalism, peer production is a contradictory phenomenon: It is simultaneously an emancipatory project, from the point of view of the hacker movement; and a rent seeking instrument, from the point of view capitalists. This contradiction can only be resolved through a social revolution that socializes all means of production. Then, peer

production will become the general form of the production of goods, services, social relations, politics and culture. This contradiction has been manifested in the hacker movement in the dispute over the concepts of commons of knowledge and licenses that regulate their use. The paper argues that Richard Stallman's

GPL/Copyleft license, eliminating the use of such commons for the extraction of rent, bolsters the emancipating aspect of peer production. The so called Open Source licenses, on the other hand, help capitalists to harness peer production for the extraction of rent.

## 02RN18 - Media & Marxism Today

Chair(s): Peter Golding (Northumbria University)

### User-Generated Content, Data, and the "Return of Rent"

**Robert Prey**, Simon Fraser University, Burnaby | [robp@sfu.ca](mailto:robp@sfu.ca)

**Jakob Rigi**, Central European University | [rigij@ceu.hu](mailto:rigij@ceu.hu)

This essay will engage with a debate between Fuchs (2010, 2012) and Arvidsson & Colleoni (2012) to offer a third perspective on whether the labor theory of value can be applied to 'prosumption'. We argue that Marx has been applied too narrowly to the study of social media. This has led to facile dismissal when it becomes clear that the 'value' of user-generated content (UGC) and personal data cannot be measured by socially necessary labor time. Instead, we will demonstrate that: 1) social media extract rent from advertisers in exchange for the lease of (virtual) space; and 2) social media also extract rents by selling UGC and personal data. We consider this type of rent as an instance of knowledge-rent. Prosumers work for free for social media in two ways. First, by engaging and paying attention to social media, prosumers convert these sites into rentable virtual spaces. This in

turn allows for the production of salable personal data. As we deal elsewhere with the rent of virtual space, here we focus on rents generated through the sale of data. We argue that, while such data may assume a "commodity form", they do not contain value. This means that while the law of value does not govern the production of data it circumscribes their exchange by fencing data off within capitalist forms of property. The incomes generated by such data are a rent, which is a portion of the surplus value produced by workers outside media. Therefore, while knowledge-rent is a key characteristic of what Autonomist Marxists (Vercellone, 2008; Marazzi, 2010) call the "return of rent", which underlies the current crisis of post-Fordist capitalism, we take a different perspective on how rent should be related to the production of value.

### Reflections on the Digital Labour Debate

**Christian Fuchs**, University of Westminster | [christian.fuchs@im.uu.se](mailto:christian.fuchs@im.uu.se)

For understanding the power structures of phenomena that are connected to the rise of "social media", a debate on digital labour has

emerged in recent years. In this talk, I will reflect on ideas, concepts and issues from this debate. Important questions in this context are:

What is labour? What is work? What is the difference between digital work and digital labour? How can these concepts be used for understanding "social media"? I will argue that we need the approach of a political economy of digital media in order to provide answers to such questions and that work and labour are crucial concepts for Critical Media Studies. Based on Marx's theory, I distinguish between work and labour as anthropological and historical forms of human activity. This distinction is reflected in capitalism in the dual character of the commodity that is both use-value and (exchange) value at the same time. Various aspects of a Marxist theory of work and labour, such as the notions of abstract and concrete labour, double-free labour,

productive labour, the collective worker, general work and alienation are used for discussing the notions of digital labour and digital work. Another argument that will be advanced in the talk is that Dallas Smythe's concept of the audience commodity has gained new relevance in the digital labour debate and that a digital labour theory of value is needed in order to understand class and exploitation on social media. The talk also presents further reflections and ideas on related topics such as the use of digital media in the Occupy movement by posing the question what the role of commercial and alternative media is in this movement and if we here can conceptually speak of working class movement media.

## A Seeping Commodification

**Jernej A. Prodnik**, Faculty of Social Sciences, University of Ljubljana | [jernej.amon-prodnik@fdv.uni-lj.si](mailto:jernej.amon-prodnik@fdv.uni-lj.si)

The paper aims to analyze the vast qualitative transformation in the process of commodification, which now completely encompasses social life. For this purpose a concept of "seeping commodification" is developed. Author claims it is through the overwhelming commodification of the wider communicative field (including information, knowledge, and culture) that the latest qualitative leap in how commodification operates occurred. It is a defining characteristic of communication that it lacks solid boundaries. Communication is more often a fluid process rather than a solidified thing. The same can be claimed of the commodification when it encroaches upon communication. Hence, a seeping commodification: it trickles down to all the nooks and activities of human lives, mimicking the communicative flow. To paraphrase Marx and Engels, today "all that is solid melts into a

commodity". The emergence of these processes accompanied the development of historical capitalism. They gathered pace in the 19th century with the increasing influence of advertising and industrial production, which finally led to the full-blown (industrialized) mass media. In the past five decades, we are able to observe an explosion of commodification in the wider field of communication. These changes were neither an automatic consequence of the continuing commodification nor were they a consequence of the (infamous) transformation to the post-industrial society. They were a long-term development, which was excessively accelerated through politically orchestrated claims: on the one hand through the transnational agreements that globally deployed intellectual property rights, and on the other hand through the global expansion of communicative conglomerates.

## A Personal Journey in Understanding Peer-Production: From Actor-Network Theory to Autonomous Marxism

Maurizio Teli, Ahref Foundation | [maurizio@ahref.eu](mailto:maurizio@ahref.eu)

In my presentation, I will rely upon my short research history as a journey that moves from Actor-network Theory to Autonomous Marxism as theoretical approaches adequate to the understanding of peer-production as one of the phenomena suggesting a transformative potential of the societally widespread adoption of the Internet as a media technology. I define peer-production as the organization of production rooted in a relationship of formal equality among the subjects participating to the production process and in forms of sharing of the final product not only among the producers but also with a wider audience. Due to the peculiar character of the products of peer-production in the digital domain, that we can call knowledge products, I took as a point of departure the interdisciplinary field of Science and Technology Studies, because it stands as the analysis of the modes of

production of knowledge. In this field, Actor-Network Theory (ANT) has proven useful in showing how the politics of peer-production was distributed among the socio-technical components of single projects and of the peer-production panorama. Nevertheless, ANT focuses on the situated production of scientific truths and technological alternatives, reducing the space for comparative analysis of peer-production able to evaluate how the same practices and processes, like in the case of free software, were part both of contemporary capitalism in the ICT domain and of practices of resistance in the contemporary social movements. To understand such dualism, I bracket cultural perspectives, as the ones emerging in contemporary anthropology, in order to find new theoretical lenses in Autonomous Marxism, in particular in Negri and Hardt's reading of the common.

## 03RN18 - Media Sociology Today

Chair(s): Peter Golding (Northumbria University)

### Explaining Protest Contagion: From Arab Spring to Occupy via M15

John Downey, Loughborough University | [j.w.downey@lboro.ac.uk](mailto:j.w.downey@lboro.ac.uk)

It is commonplace to assert that the protests beginning in Tunisia in December 2010 and spreading to other countries and continents were intimately related. Their mobility is to be, at least partly, explained by transnational flows of activists and communications. Indignados in Spain and Occupiers in North America speak of being inspired by the events of Tahrir Square in Egypt. The purpose of this paper is initially to

use a method called analytical process tracing to track the spread and extent of protest from country to country. I will then use a method called fuzzy set Qualitative Comparative Analysis to explain why protest took greater hold in some countries outlining various causal recipes that explain the presence and absence of protest mobility.

## Wither the Demagogue! The Media as Watchdogs of Financial Capital

Roy Panagiotopoulou, University of Athens | [rpanag@media.uoa.gr](mailto:rpanag@media.uoa.gr)

Widersteht den Demagogen! This was the main title at the front page of Financial Times Deutschland (18.5.2012); written in German but also in Greek, accompanied with the picture of the leader of leftwing party SYRIZA, two days before the Greek national elections. For these elections the polls predicted that citizens intended not to vote for the political parties that sustained the austerity programme and to punish the old political system that have led the country to bankruptcy and corruption. This harsh interference in the electoral campaigning of a democratic country by a newspaper that expresses directly the interests of the financial capital was unprecedented. Fear and dramatization as elements in news reporting are not new; however, the unmasked interference of the international financial capital in the political arena, trying to cause fear and indirectly

impose to a nation to vote as desired (a similar reaction was observed referring to Berlusconi's candidacy for the upcoming elections) was new. Numerous international newspapers and magazines reflected the anxiety of their governments regarding the fate of Euro and their banking system. This paper will examine the international pressure upon Greek citizen through printed media during the electoral campaigning in May – June 2012 and will draw comparisons to the Italian case. Using content analysis of the articles printed in a financial and a political newspaper as well as in 2 political magazines it will demonstrate the new intervention strategy of financial capital into political decisions. Questions about the future of democracy, ethical codes of news reporting and the dependency of media enterprises from financial capital will be discussed.

## “Old Media”, “New Media” and the (Ruling Ideas about) Crisis

George Giannakis Pleios, University of Athens | [gplios@media.uoa.gr](mailto:gplios@media.uoa.gr)

According to several findings “old media” appear to “run behind the flag” of elites in “defining the situation” regarding the media coverage of the current economic crisis, though their neoliberal policies undermine the consumption trend, which was a vital condition for the media. In times of crisis the very existence of commercial media depends more on economic and institutional arrangements made by the elites through state power than on advertisement and sales and vice versa. On the other hand “new media” constitute a privileged field and means for alternative voices and journalism. The main question of our presentation is whether “new media” fulfill their above mentioned role in terms of defining the current economic crisis. Or, whether, in contrary “new media” become a means for differentiation and flexible consolidation of the elites' views about the crisis, through the

production of content and ideology by citizens and other agents. According to the “alternative presentation” argument, approaching the crisis through “new media” becomes a means for positive (vs critical) construction of identities, relations and concepts of individuals within the “capitalism in crisis” environment. In this sense “new media” contribute to overcoming the defined by the elites' crisis, in favor of a new structure of symbolic capitalism, in which citizens realize themselves the substitution of the real enlarged consumption, mainly cultural, by a virtual one, where citizens actively participate, through their own work and cultural activity. Our presentation is based upon theoretical analysis as well as content and discourse analysis of “old” and “new” media content related to the crisis, in five European countries.

## From Watchdog to Content Provider? Reflections on the Changing Landscape of Contemporary Media Work

Romina Surugiu, University of Bucharest | [rominasurugiu@yahoo.com](mailto:rominasurugiu@yahoo.com)

Many myths surround the realm of journalists. They are supposed to be part of the Fourth Estate, watchdogs of democracy, opinion-makers or gate-keepers. However, less is known about the nature of the journalists' work, in times of professional and economical crisis. In the present paper, we will summarize and reflect on the data furnished by up-to-date European research projects or surveys on nowadays journalism and journalists. The research conducted in emerging European economies as Romania, Moldavia and Poland have shown that many journalists work under precarious conditions (low wages, long hours, under the constant pressures from advertising or company ownership). Studies and surveys from UK, France or other European countries also present journalist as a "tired" or "timid" professional, with a low self-esteem, subject to continuous changes such as: insecurity of

employment, an increase of short-term contracts, temporary and freelance work, decreasing wages, and problems related to media concentration in global companies (see for example the reports of the International Federation of Journalists). A decline in ethical reporting is also mentioned. The online development has had many unexpected consequences for the journalists: they are expected to learn by themselves the tools of the trade, to produce many versions of a story for multimedia platform, and to produce three times more journalistic content than 20 years ago. Public levels of trust and appreciation of journalists are low, as journalists are perceived by the public as web content providers or tabloid writers, ready to sell any story to the audience. The traditional role of Fourth Estate or watchdog fades out in the light of the computer screen.

## a04RN18 - Advertising, Marketing and Commercial Culture in Times of Capitalist Crisis

Chair(s): Christian Fuchs (University of Westminster)

### Between Building and Branding the Nation Online: Citizens Debating the New Patriotism in Poland

Magdalena Kania-Lundholm, Uppsala University | [magdalena.kania@soc.uu.se](mailto:magdalena.kania@soc.uu.se)

This paper looks at how discourses on nation building, national identity and patriotism converge with discourses of neoliberalism, globalization and commercialism. However, instead of looking at how states employ commercial practices to brand themselves or how commercial entities employ references to nation, it looks at the process of convergence between the national and the commercial from

the citizens' perspective. More specifically, it addresses the Polish debate on "new patriotism" in the post-socialist online context. The paper addresses the question on how citizens make sense of construction of national community and solidarity on the one hand and becoming part of a global market and Western society on the other. The study applies critical discursive analytical perspective on the

materials coming from Polish online discussion forums and citizenship journalism articles discussing the “new patriotism”. Nation branding has grown extensively in the past decade as a practice where nation-states together with international branding consultants execute marketing campaigns in order to attract tourists and investors. At the same time scholars seldom address the difference between externally-oriented nation branding campaigns and the more

domestically-focused processes of nation building. Also, the role of social media in these processes is rather overlooked. Because these processes are taking place simultaneously, it often leads to tensions that deserve scholarly attention. The results of the analysis show tensions between the construction of new national self and the necessity for international recognition. It also points to the ambivalence between domestic nation building and global nation branding.

## Big Data Conquering the Self: The Role of Data and Numbers in Quantifying the Self

Uwe Vormbusch, FernUniversität, Hagen | [uwe.vormbusch@fernuni-hagen.de](mailto:uwe.vormbusch@fernuni-hagen.de)

Karolin Eva Kappler, FernUniversität, Hagen | [karolin.kappler@FernUni-Hagen.de](mailto:karolin.kappler@FernUni-Hagen.de)

The current crisis may be presented as a fundamental crisis of capitalist calculation and accountability. Whereas in the spheres of finance and economy traditional notions of value erode, simultaneously new forms of calculation are established that frame the everyday-world and make the human body and people's entire conduct of life accountable. The current era of big data opens unprecedented possibilities to track, measure and study people's digital behavior, both individually and socially. Big data are not only big because of its size. Its main value lies in its networked character and its connectivity to other data. Drawing on the work of Weber and Sombart we argue that self-calculation is part of a major shift in the way value is being made accessible and calculable in contemporary

capitalism. “Sociocalculation” is at the heart of this shift, illustrating in what way calculation have to change in order to access territories that have been presumed uncalculable before. We will exemplify this on the subject of the QuantifiedSelf-movement. First, on the individual level, the usage of numbers gives control back to individuals that are trying to overcome individual insecurities generated in crisis-ridden contemporary society. Second, new inequalities surface due to the use of increasingly sophisticated technology. Third, measuring ‘the social’ has close relationships with contemporary capitalism: it is turning the networked self into a quantified and measured self, that is continuously striving for optimization and marketability of his/her capabilities.

## Advertising and Media in the Framework of “Monopolistic Competition”, and the Socio-Ecologic Transformation

Josef Baum, University of Vienna | [baum.josef@gmx.at](mailto:baum.josef@gmx.at)

Jerry Mander began an article “Privatization of Consciousness” in Monthly Review October 2012 by the question “Is advertising legal?” and highlighted the imprinting of the individual, especially beginning with children and various

power relations in respect to media and advertising. This knowledge basically is not new, but it is worthwhile to combine it with some political economy and political ecology. An initial hypothesis is that the current

concrete form of advertising can be identified as one factor blockading the socio-ecologic transformation towards sustainable development. Along the good old “monopolistic competition” (Joan Robinson) commercial advertising on the one side is a result of oligopolisation with product differentiation and constructing brand images and on the other side it is very successful in protection and extension of oligopolistic profits relentless against SME quasi as “weapons of mass destruction” and establishing “entry barriers” Advertisement in media is a central issue in the globalisation of unsustainable consumer styles. Also the soft “governance” in the

orientation of media should be stressed, there is also a strong connection to policy. Most powerful is advertisement by television but in the internet age advertisement is still more elaborated, see Google. By strongly influencing the preferences, wasting of resources for protection of market power and so decreasing possibilities for fundamental innovations “lock-ins” are enforced implicating blockading the socio-ecologic transformation towards sustainable development. But there are also real possibilities of measures of regulations. See the successes in the advertisement for cigarettes. ....

## **The Close Liaison between Television and Sports: Football Rights, Business, Competition and Societal Issues**

Petros Iosifidis, City University, London | [P.Iosifidis@city.ac.uk](mailto:P.Iosifidis@city.ac.uk)

This article looks at the relationship between television and football in Europe from a business, regulatory and socio-cultural viewpoint and it is divided into three sections. Section one examines the relationship between television and sport and outlines the reasons as to the escalating costs of acquiring the rights for major sporting events across Europe. It analyses the unique character of football that has proven it largely resilient to the current economic downturn and considers the reasons as to why pay-TV consortia overbid for football rights, thereby jeopardising their financial

viability. Section two addresses competition issues. It starts by outlining the main competition concerns, such as exclusivity in the marketing and selling of broadcasting rights, joint selling of TV rights and vertical integration between broadcasters and sports teams. It then moves on to describing and assessing the EC competition law in relation to sports rights. The final section views sport as a socio-cultural activity and in this context it makes a case for major sport events being available in free-to-air TV channels.

## **b04RN18 - Journalism, News and Media Coverage in Times of the Big Crisis 1**

Chair(s): George Pleios (University of Athens)

### **The Panic Button: Public Habits in Online News Media about Economic Crisis**

Jeremy R Matthew, King's College, London | [jeremyrmatthew@gmail.com](mailto:jeremyrmatthew@gmail.com)

The global and European economic crises are being reported against a background of crisis

in journalism and news media. But while it is difficult to see the positive outcomes in financial crises, the positive or negative natures of media crises are more arguable. As traditional media organisations find themselves unable to afford investigative journalists and daily publications, members of the public find themselves able to access and participate in more news information than at any previous time in history. This shift raises a number of questions about whether the power of agenda setting is shifting from beleaguered traditional mass media organisations to a participatory public, whether news information has become more democratised, or whether new media organisations now have the power to set news agendas through algorithmic displaying of content and 'filter bubbles'. Are

individuals really able to access more information than before about economic crises? Or are news discourses now dominated by opinion-journalism, 'clickbait', and echo-chambers reinforced by each user's lists of friends and searches filtered according to the aims of new media organisations? This paper aims to explore these issues by looking at media theories and research of user habits relating to crisis-related news and information. It will critically discuss these issues from both a theoretical perspective and with data taken from a series of focus groups on viewer opinions of financial crisis news on television and Internet video sites. It will discuss issues relating to whether developments in new media technologies may be "part of the problem or part of the solution of the crisis".

## **Sociology of Turkish News: Analysing Perspectives of News Sources and Producers**

**Ekmel Gecer**, Loughborough University | [e.gecer@lboro.ac.uk](mailto:e.gecer@lboro.ac.uk)

Mentioning media as the fourth estate in a democratic context refers an ideal society and actually an ideal democracy. Although the interaction between media and democracy points a restricted reality in western countries, it is in fact completely unrealistic in Turkey due to poli-military tutelage and authoritarian constitutional structure which was established after military coups. Today Turkish media do not only face pressures from the government or the army but the media organisations also have problem within their structure and ideologies. In the democratic transition process, the army has lost its old influence on politics and the media. However now there is another 'control shift' on the media pressures agenda. In this regard this paper intends to examine the challenges that news media is currently facing and tries to answer how news media contributes the democratisation in Turkey and the power of news production in managing the conflicts in Turkey. The study

will talk about the democratisation process in Turkey after 80s, combining theories of democracy and communication through analysing special events regarding Kurdish Question of Turkey. The study will at the same time ask more general questions about: the connection between news production, society and politics during democratic change in Turkey under alleged political and military pressure. The analysis of this coverage will be based on semi-structured informant interviews with politicians, academics, NGOs and media professionals. These interviews will at the same time allow us to examine the change in the Turkish news production, how theories of news sociology have been advanced and challenged by recent social and political alterations; agenda building factors of the mainstream Turkish media, the relation between the news sources and news producers and censorship experiences while covering the sensitive issues.

## Manufacturing Consent and Legitimizing Austerity: The Greek Media in the Crisis

Nikos Smyrnaio, University of Toulouse | [smyrnaio@free.fr](mailto:smyrnaio@free.fr)

Since the outburst of the economic crisis the Greeks suffer a deluge of unprecedented anxiety. The psychological shock for the population is even harder to bear than before 2009, nothing foreshadowed what was to come. If some rare observers have warned of the poor state of public finances as well as of the endemic corruption, no politician or prominent journalist had warned of their potential consequences. None of the most influential media had seriously and systematically investigated these questions. Nowadays the situation is completely reversed. The "crisis" is the dominant not to say unique theme in the public debate. There is an inflation of more or less well informed articles, broadcasts, analyses and debates on this issue. The

mainstream media, largely benefiting from the boom years, are now with the traditional "parties of government" the principal defenders of the current policy of austerity. Our research aims in explaining how this journalistic catastrophe came to happen. Through a detailed analysis of the media ownership structure and the journalistic practices that prevailed in Greece for several years and are still dominant we will show how mainstream media were placed in the service of the political and economic establishment before the crisis and how they continue to legitimize anti-social measures. Our study is based on diachronic empirical research and observations made on Greek mainstream media between 2005 and 2012.

## The Economic Crisis and Economists' Conflicts of Interest Disclosure: Will Business Journalists Aid the Cause?

George DeMartino, University of Denver | [gdemarti@du.edu](mailto:gdemarti@du.edu)

The economic crisis has provoked close scrutiny of the failures of the economics profession. Not least, the profession failed to predict the crisis. Moreover, the film *Inside Job* and subsequent studies revealed that in the years leading up to the crisis academic economists routinely did work-for-hire for business interests, at very high levels of compensation, without disclosing their financial entanglements when publishing their work or taking positions on policy matters of importance to the firms that paid them. In response to criticism about its ethical failures, leading economic associations in the U.S., France, and Germany adopted conflict of interest (COI) disclosure rules. But the new rules are deeply inadequate on multiple grounds. In particular, none urge academic economists to avoid COIs, even though this is a

standard provision in professional ethics in other professions. But might there now be sufficient pressure on economists from the consumers of economic expertise, such as journalists, to ensure adequate disclosure? The paper reports the results of a survey of business journalists, which indicate that the pressure emanating from journalists is uneven owing to various factors stemming from the constraints under which journalists work today; and to the fact that some leading business journalists are themselves conflicted by their own financial entanglements with the financial industry. Hence, the economics profession must do much more to ensure appropriate conduct among economists. The paper concludes with a call for the establishment of professional economic ethics as a new field of inquiry.

## a05RN18 - Social Media Sociology and Contemporary Society

Chair(s): Christian Fuchs (University of Westminster)

### Nature 2.0: Theorizing New Media and Nature Conservation in a Time of Capitalist Crises

Bram E. Buscher, Erasmus University | [buscher@iss.nl](mailto:buscher@iss.nl)

Web 2.0 and social media applications that allow people to share, form and rate online content are crucial new ways for conservation organizations to reach audiences and for concerned individuals and organizations to be (seen as) 'green'. Recent research indicates that these developments might significantly change the political economy of nature conservation: the production, circulation and consumption of conservation and their social and political effects. Two important changes relate to how online activities stimulate and complicate the commodification of biodiversity, ecosystems and landscapes and how they help to reimagine ideas and ideals about ('pristine')

nature. By developing the notion of 'Nature 2.0', this paper aims to theorize these changes within the contemporary context of capitalist crises. More specifically, by combining theoretical work foregrounding the notions of 'circulation' and 'value' and by using Hannah Arendt's insights with respect to the place of 'production' in capitalism, the paper attempts to provide building blocks for understanding the (potential) impact of new media on the political economy of conservation and nature-society relations more broadly. The paper concludes by exploring the role and meaning of 'Nature 2.0' in our time of capitalist crises.

### Beyond the Mass Mediated Public Sphere: Social Movements and Social Media

Renata C. Motta, Freie University, Berlin | [renata.motta@fu-berlin.de](mailto:renata.motta@fu-berlin.de)

Habermas' theory of the public sphere contrasts to the functionalist theories that conceptualize it as a mirror of the status quo. Its emancipatory potentials lie in the communicative power created by communicative processes, which can change power relations. However, having identified two pathologies of political communications in the public sphere—constituted by the lack of independent media and the absence of feedback between the mass media and autonomous publics—Habermas (2008) finishes with a pessimist analysis of contemporary democracies and no solutions to overcome such pathologies. This paper searches in the critical theory, in the works of authors who dialogue with Habermas' theory, alternatives in the concepts of social movements and social

media. First I resort to Cohen and Arato (1992) to argue that, more than individuals in the audience of a mass mediated public sphere, a civil society permeated by networks and social movements has a more active role than to react to systemic actors and commercial media. Then I rely on Avritzer (2002) to question the role of (elite) mass media and shed light on democratic potentials of alternative fora. Finally, I suggest another level in Habermas' scheme of the informal public sphere: the level of social media, lying between mass media and direct encounters. Beyond published opinion and the long-term formation of values, measured in public surveys, social media constitute forums where public opinion is formed, including processes of reflexivity to mass media content. They constitute a locus to

search for the activity of autonomous publics and social movements.

## Social Media, Mass Media and the Social Construction of Reality

Jan-Felix Schrape, Universität Stuttgart | [felix.schrape@sowi.uni-stuttgart.de](mailto:felix.schrape@sowi.uni-stuttgart.de)

Since the 1990s, the World Wide Web serves as a projection space for varied visions of a more transparent and integrative public sphere and a less dominant role of mass media in the social construction of reality. In light of those expectations, this presentation examines the relations between digital social media and mass media from a systems-theoretical perspective ('operative constructivism') and observes the present preferences of European onliners as well as the content quality of network communications (e.g. weblogs, podcasts, social networking platforms, microblogging services). The empirical investigations and theoretical reflections lead

to the conclusion that social media and mass media are situated on complementary levels of publicness: While the mass media as an autopoietic system construct a widely shared social reality, which is highly fragmented and simplified but nevertheless indispensable for societal coordination, digital social media accelerate and intensify the communication in issue publics, communities of interest or network domains. Thus, social media neither rival nor supersede traditional mass media, but facilitate the crystallization and diffusion of innovative perspectives on a meso level of social reality construction.

## Understanding Identifications with Online Groups. A Comparison of Finnish Users and Non-Users of Social Media

Pekka Rasanen, University of Turku | [pekka.rasanen@utu.fi](mailto:pekka.rasanen@utu.fi)

Atte Oksanen, Finnish Youth Research Network | [atte.oksanen@utu.fi](mailto:atte.oksanen@utu.fi)

James Hawdon, Virginia Tech | [hawdonj@vt.edu](mailto:hawdonj@vt.edu)

Recent research suggests that the internet social network sites (SNS) have notable impact on individuals' social relations. Some researchers argue that online group memberships are becoming increasingly important sources of social identification. They suggest that online groups are likely to replace many of the traditional group memberships. Empirical studies indeed indicate that especially young people feel close to their online groups and online network friends. However, there are also researchers who criticize these findings. They argue that the perceived importance of online social networks is connected with various other factors

including person's gender, level of education, computer use skills, and time spent on the internet. This paper looks at different predictors of identification with online groups in Finland, with a particular focus on users and non-users of social media. The data are derived from a nationally representative mail-survey administrated to citizens aged 15 to 64 (n=908) in 2011. The findings indicate that several background factors contribute to identification with online groups both among users and non-users of social media. In conclusion, particularly the significance of age and internet use frequency is discussed.

Chair(s): Peter Ludes (Jacobs University, Bremen)

### **Collective Identities and Conflict Narrative: The Case of the Diasporic Audiences of the Israeli-Palestinian Conflict**

Jerome Bourdon, Tel Aviv University | [jerombourdon@gmail.com](mailto:jerombourdon@gmail.com)

My paper will analyze the controversies which are surrounded the coverage of the Israeli-Palestinian conflict in three Western countries, the USA, the UK and France. It will suggest that the implications of the actors of the conflict has put much pressure on the media, and made the work of the journalists quite difficult, as they are torn between pro-Israeli, pro-Palestinian, Jewish, Arab-Muslims, and variously committed political audiences. It will stress the role of diasporic actors, supporting each side of the conflict at a distance. It will put much emphasis on the role of the Internet as a powerful tool for monitoring the media and putting pressure on them. However, it will not claim that technology per se explains the crisis

of this specific conflict narrative. The part played by diasporic public will be the focus on the paper, which will show how the narrative of this conflict cannot be detached from the way various publics, not only criticize it, but use it for building their own narratives of integration, or lack of integration, in the national and global mediascapes. Beyond the specific case of the conflict, we think that such an example illustrates the need to redefine the role of the journalist when dealing with hot topics connected with collective identities among his or her readers, which can no longer be longer as national citizens looking for information, but rather, as fragile multi-cultural citizens looking for orientation in a confusing world.

### **Strong Political Agenda-Setting and Weakening Journalism? The Case of Renewable Energy Coverage in Portugal**

Mónica Truninger, University of Lisbon | [monica.truninger@ics.ul.pt](mailto:monica.truninger@ics.ul.pt)

Carla Oliveira, Universidade de Lisboa | [carla.oliveira@ymail.com](mailto:carla.oliveira@ymail.com)

Luis Junqueira, Universidade de Lisboa | [luisljunqueira@gmail.com](mailto:luisljunqueira@gmail.com)

The relationship between journalists and their political sources has long been considered as symbiotic, with mutual gains for both parts. It is also known that the media tend to be dependent upon official and elite sources, and that public relations have become increasingly influent. Furthermore, current changes in journalism associated with economic crisis and processes of concentration and convergence

are leading to cost reductions in newsrooms, cuts in jobs, and also increasing time pressure in news production. In this context, it is interesting to observe how news coverage of a complex issue that requires specific interdisciplinary knowledge (economic, technical, environmental) from journalists, such as renewable energies, is evolving. This paper proposes such analysis in a country

where a severe economic crisis has been affecting traditional media, at the same time as the government decided to invest in renewable energies as a way to respond to the external debt (due to dependency of oil imports at increasing costs) and environmental challenges. Preliminary results suggest that news coverage of renewable energies matched the Portuguese governmental agenda-setting around this policy, beginning in 2005, when the prime minister first presented it, reaching a

peak in 2009, when, in the face of escalating financial crisis, the government emphasized its communication, and since then has been declining, as the new government changed its policy and made cuts in public investment. Yet, nowadays, news coverage of this issue would be even more pertinent, as local impacts of wind farms are emerging and, moreover, for environmental and economic reasons, the public needs to understand current energy challenges.

## Critical Theory and Disability Studies: Constructing the Public Sphere of Disability Issue

**Volha Verbilovich**, Higher School of Economics, Moscow | [verbilovich.olga@gmail.com](mailto:verbilovich.olga@gmail.com)

**Valeria Markina**, Higher School of Economics, Moscow | [leramarkina@yandex.ru](mailto:leramarkina@yandex.ru)

The paper provides theoretical understanding of the main changes in media-discourse on people with disabilities problems in Russia after ratification of the UN Convention on Rights of People with Disabilities on April, 27 2012. The research deals with the theoretical concept of “public sphere of disability” in order to understand how the processes of social interaction proceed on the way of construction and managing “unstable identity of people with disabilities” under the influence of the power of medicine, politics and cultural prejudices. The paper shows that there is some positive dynamics in the construction of people with mental disability image in Russian mass media. At the same time for the last six years there have been a number of public scandals which, on the one hand, reflected strongly negative and stigmatizing attitudes towards

people with disability, and, on the other hand, induced strong public reaction, which enhanced collective identity of people with disabilities. Based on critical theory issues and Jurgen Habermas communicative action approach “public sphere of disability” is defined as symbolic space and the process of specific identity of people with disabilities forming through rational-critical discussion within both on the level of the state ideology, mass-media discourse and on the level of “grassroots” collective action. It is shown that public sphere of disability is becoming more and more “visible”, emphasizing emancipatory interests and positions of people with disabilities. But the processes of identity forming of people with disabilities are distorted by manipulative strategies of mass-media representations of people with disabilities.

## The Issues of Representation in Media: Representations of the Working-Class in Turkish News Media

**Fulya Sen**, Firat University Communication Faculty | [fulyasen@firat.edu.tr](mailto:fulyasen@firat.edu.tr)

The media has created a negative representation of the working class. Inequality is legitimated through news text and the poor classes are largely excluded by news media.

The media reflects the well-established dominant ideological images and ignores the structure of governmental and defects of capitalism. The media rarely considers macro-

level causes of impoverishment such as inequality of opportunity in education and health system, underemployment due to economic shifts and fatal accidents at work, the issues of subcontracting. In this study, it is argued that the news media generally focus on the working class to label them as a problem or criminal. Working class groups are seen as issue of individual inadequacy and the main cause of these social problems rather than government policies or poor business practices. The problematic of this study is losing of importance of working-class identity in the process of global capitalism and media's view to the class identity as the tool of the

hegemony of global capitalism. The aim of this study is to examine the representations of working-class identity through the news texts concerning the death of mine workers, subcontracting system, precarious working conditions in the alternative and mainstream media. It is used the model of Van Dijk's critical discourse analyses and content analyses in order to point out the ideological dimensions of news texts and tried to show how to be constructed dominant discourses in the news media. Thus, it is tried to show the different perspectives between alternative and mainstream news media via news texts on working-class.

## 06JS18JS29 - Social Theory and Media Sociology Today 1

Chair(s): George Pleios (University of Athens), Csaba Szalo (Masaryk University)

### Cultural Studies in the Scene of Social Conflict and Social Solidarity

Tolga Hepdinċler, Bahcesehir University, Istanbul | [hepdinc@gmail.com](mailto:hepdinc@gmail.com)

Firstly, this paper will analyze how cultural studies and media studies theorize working class at the turn of the twenty-first century. Moreover, class relations and interactions will be discussed in relation to the Marxist orthodoxy. The structural relationship between the working class and mass culture, which is constructed upon property ownership, mechanisms of distribution and sustainability of the whole process will be elaborated. Especially Williams' and Hogart's writings on the roles of the working class immanent to culture, Thompson's central attribution to culture in the construction of the working class and Hall's writings on the relationship between cultural identity and working class in the context of hegemony will be the basis of defining the role of working class in cultural

studies. In the last three decades of the 20th century, most of the American cultural studies have been evolved around the identity axis and mass culture's role on the construction of the cultural identity. This brings about the necessity to discuss the transformation in the definition of the working class compared to the postmodern/ post-structural /post-colonial discussions. In this context, theorization of the working class has lost its academic importance against ethnicity, gender and race. Through the lines of the above-mentioned discussions, this paper will define and analyze the validity of new tendencies in cultural and media studies within our specific research on the working-class in the scene of social conflict and social solidarity in Turkey.

## Communication of the Cultural Public Sphere

Maarja Lõhmus, University of Tartu | [maarja.lohmus@ut.ee](mailto:maarja.lohmus@ut.ee)

This work presents an overview of the communication theoretical foundations that allow for the cultural conceptualising of the public sphere as a global field. In 1964 McLuhan conceptualised media as the extension of one's senses, which allows man to experience the world more deeply and broadly (McLuhan1964). In modern times this offers the opportunity not only for personal cognition, but also for global presentation; the featuring of and communication between individuals and cultures have been opened up. Both individuals, on the micro level, and countries and cultures of the world, on the macro level, have received new perspectives during the development of the new information and media technologies: humankind can share information and original stored and living cultural achievements in the new, global mental space. Habermas has theoretised the

public sphere, dividing it into political and cultural spheres (Habermas1962). The theories of the public sphere are focused more on the political public sphere. The goals of the political public sphere have been unification, standardisation and reaching a conclusion(s). It is more difficult both technologically and ideologically to accentuate the cultural public sphere, or model the common global cultural field as the values of UNESCO cultural heritage and as living cultures. The value of the global cultural public sphere is the diversity of ways of thinking and languages. I study the model, how theories of communication are guiding to the field of human cultures (Habermas1962, Habermas1975, Giddens1984, Anderson1991, Castells1998, Webster2004, as well as sociology- Bourdieu, post-structuralism- Foucault, semiotics- Barthes, Lotman; transcultural theories- Hepp, Livingstone, etc

## Simmel's Theory of Fashion as a Hypothesis of Affective Capitalism

Juhana Venäläinen, University of Eastern Finland | [juhana.venalainen@uef.fi](mailto:juhana.venalainen@uef.fi)

During the recent years, it has been widely claimed (and argued over) that communicative and emotional skills have become a major constituent of organizing work in contemporary capitalism. The so-called 'affective labor' produces new subjectivities but also mobilizes more corporeal potentials for use of economic valorization. Thus, the key challenge of this new mode of production – referred to here as 'affective capitalism' – is not only about the capacity of the capital to commodify emotions but also and more importantly about the possibility of producing and reproducing a new 'affective human' (cf. homo economicus) and regulating his/her elemental volatility. This paper contributes to the research of social theoretical roots for new understandings of contemporary capitalism through a contextual rereading of Georg Simmel's writings on fashion. What Simmel develops here is

essentially an account of a new socioeconomic logic in which economic valorization is based on the passionate dialectic between imitation and variation. In the logic of fashion, the unsettled affects (such as restlessness, choppiness and contingency) do not hinder productivity but, on the contrary, seek to establish new platforms of accumulation. The second part of the paper discusses the political consequences of the vulnerable accumulation. Affective capitalism does not sigh for stability but flourishes in times and conditions of a continuous crisis. Thus, the organization of uncertainty is accompanied by double-edged changes in the structure of affects, as experienced by the economic agents, that provide a stock of 'seed capital' likewise for the politizations of happiness and for the normalizations of misery.

## Crisis and Public Spheres : Polis, Nation, Iterative Democracy

Gilles Verpraet, University Paris Ouest Nanterre | [verp@ehess.fr](mailto:verp@ehess.fr)

Globalization processes and media connexions challenge the notion of public sphere as an arena for the exchanges of argumentation (Habermas, 1979, Habermas, 1994, Jacobs, 2012). These transformations questions not only the arena of debates, but also the political subjects who may address in the public sphere and the consistency of political culture (Eder, 2001) The question comes to examine the modes of recognition and the encounters inside the extended social networks, inside transnational social space. This methodology examine the dynamic of democratization as community of issues (Arendt), as politicization of common issues (Tassin, 2002, Beck, 2006). The polis indicates a moment of collective anxiousness, and claims. It designates also a moment of collective deliberation and of

construction of political alternatives We conclude to the constituency of three public spaces based on three encounters regimes (local, national, transnational). The analytical question comes on the modes of connexion between these three public spaces. This analytical development will be argued on the case studies such as the anti crisis mobilizations in Europe (Greece ,Iceland) and the Arabic mobilizations for democratisation between different public spaces. We discuss the concept of iterative democracy (Benhabib, 2006), formalizing the adjustment of alliances and the coalitions for the budgetary economic constraints, as a research process so to reconfigure the State and the political system within the financial constraints

## Narratives of Crises on TV: Centennial and Annual Reviews from Four Cultures

Peter H. Ludes, Jacobs University, Bremen | [p.ludes@jacobs-university.de](mailto:p.ludes@jacobs-university.de)

Looking back on the 20th century of two world wars, genocide, nuclear bombs, colonial wars, and economic crises, major TV centennial reviews reveal specific crisis narratives. About five hours each of centennial reviews from Brazilian, Chinese, and US TV stations as well as about 25 hours of the public broadcasting review in Germany were analyzed. In addition, more than 95 hours of TV annual reviews from these four cultures, since 1999, were analyzed, reconstructing varieties, commonalities, and trends with concrete visual examples. High levels of violence are portrayed as especially newsworthy. The Brazilian centennial review, however, does not highlight wars or crises; the Chinese reviews emphasize the end of the century of humiliation from the mid-19th to the mid-20th century and the rise of a victorious

nation under Communist Party leadership; the German view back implies references to two world wars as well as pride in economic success since the fifties; the US centennial reviews celebrate a century of American global mission, grounded in democratic-moral-economic-cultural-military superiority. The TV yearend reviews since 1999 shift the balance from a history of great good vs. evil heads of state and soldiers to common people, financial markets, and international cooperation. These worldviews point to audio-visual grand narratives as indicators and partial forums for civilizing spurts (in the sense of Elias, 1939/2012, and Pinker 2011) and long-term frameworks for current crises diagnoses and journalistic, political or sociological (e.g., Beck 2012) judgments.

## a07RN18 - Sociology of Knowledge Labour 2

Chair(s): Romina Surugiu (University of Bucharest)

### Contemporary Crises of Professional Journalism: Consequences of the Digitalization of Labour for Journalists and their Audiences

Debra M. Clarke, Trent University | [dclarke@trentu.ca](mailto:dclarke@trentu.ca)

Contemporary discussions of professional journalism almost invariably address one or more of its current "crises." There can be little question that the profession is presently under siege, although not by citizen journalism or user-generated content, nor by the decline in newspaper readership. Those most besieged are journalists themselves, throughout many Western capitalist societies, as a direct result of aggressive cross-media ownership convergence and radical cuts to newsroom labour forces. Journalists who remain confront heavier workloads and other significant changes in the conditions of their labour associated with digitalization. This paper traces the implications of these social conditions for both journalists and their audiences. There is abundant European and North American evidence that most journalists are keenly attuned to the underlying political economy of

news production. Moreover, most journalists lament the decline of investigative journalism and the increasing inability of the journalistic field to fulfill its own established standards. Also evident, however, is a set of misperceptions regarding audiences and their news interests that is incompatible with the results of qualitative reception research. Through integrated analysis of news production and reception, the paper seeks to specify the social conditions which prohibit the satisfaction of journalists' professional needs and the informational needs of their audiences. It is concluded that the contemporary crises of professional journalism have exacerbated the longstanding limitations of news and heightened the level of political exclusion experienced by women and working class news publics.

### News Media and Economic Crisis in Central and Eastern Europe: Consequences for Journalistic Autonomy

Vaclav Stetka, University of Oxford | [vaclav.stetka@politics.ox.ac.uk](mailto:vaclav.stetka@politics.ox.ac.uk)

This paper presents a comparative analysis of the impact of the global financial crisis on news media markets and journalism in the ten countries of Central and Eastern Europe which have since 2004 become part of the EU. Following an overview of the weakening economic base for news media operation in CEE, particularly caused by the sharp drop in advertising revenues, the paper analyses recent changes in media ownership structures, characterized mainly by the departure of foreign/transnational investors from some

countries or the region as a whole, and the rise of a new type of media owners – local business tycoons and oligarchs, often motivated by the prospect of gaining political or business influence rather than seeking profit. Utilizing data from a set of over one hundred semi-structured interviews with local experts and media practitioners (journalists, editors and managers), collected as part of the project Media and Democracy in Central and Eastern Europe during the last three years, this study critically examines the impact of both the

budget cuts and ownership changes on journalistic autonomy and independence, as well as on the ability of media to perform their normative role of “watchdogs of democracy” and to act as one of the mechanisms ensuring political accountability. While acknowledging important differences across the region, this

study argues that due to the economic crisis, the space for independent quality journalism has significantly shrunk in most countries over the last several years, and the news media are getting increasingly intertwined in business-political power networks.

## Social Media in the Workplace: A Contested Terrain

Martin Upchurch, Middlesex University | [m.upchurch@mdx.ac.uk](mailto:m.upchurch@mdx.ac.uk)

Rickard Grassman, Middlesex University | [r.grassman@mdx.ac.uk](mailto:r.grassman@mdx.ac.uk)

The advent of Web 2.0 web-based social media has encouraged debate about the potential for reviving or invigorating collective action against the employer in the workplace. These debates follow earlier discussion on Web 1.0 which, at the time, were presented as an opportunity for trade unions to counter the debilitating effects of neoliberal restructuring and globalisation. Possibilities were suggested for ‘distributed discourse’ both within and beyond the workplace which might permit the reshaping of power between capital and labour and also permit the reshaping of power within the labour movement. However, these new technologies may provide an extended opportunity for employers to increase surveillance and control in (and beyond) the workplace. These warnings of the ‘dark side’

manifest themselves through employer’s use of ICT for monitoring of work speeds and tasks. ICT is utilised by employers not only as a finely tuned tool of control and co-ordination but also as a weapon to intensify work. Spheres of time between the corporate world and the private are increasingly blurred, Web 2.0 has presented a threat to employers in the workplace and processes of employer counter-mobilisation have emerged. This paper reviews the workplace battleground by referring to case study evidence drawn from real time disputes where use of social media by employees has been a feature of union activity. The 2010/2011 British Airways cabin crew dispute and the 2012 teachers’ workload dispute in the UK are used as case studies.

## Everyday Economics: The 2007 Economic Crisis through Internet Memes

Elizabeth A Ramey, Hobart and William Smith Colleges | [ramey@hws.edu](mailto:ramey@hws.edu)

The 2007 economic crisis demonstrated clearly that something had gone terribly wrong in the economics profession. The neoliberal faith in free markets was exposed as more dogma than science, and the claims to privilege of professional economics knowledge rang increasingly hollow. The disciplinary boundary separating professional from popular economics formerly policed by the fallen professionals seemed increasingly inconsequential, even dangerous. With the

legitimacy and relevance of professional economic knowledge and professional economists in question, what did other forms of economics knowledge and practitioners have to offer in that moment? In this paper, I examine the evolution of non-professional economic knowledges before and after the economic crisis. I investigate a particular form of informal economics discourse, internet memes. With the growth of social media tools and sites, internet memes, concepts that

evolve and spread rapidly from person to person via the internet, have become an increasingly salient form of cultural communication and transmission of ideas. Likewise, internet memes may be an important vehicle for conveying and transforming popular understandings of economics. While the

economics of the everyman is denigrated by the so-called professionals as unscientific and inconsequential, I argue that such a claim cannot be sustained, and that popular economics exceeded the professional in both relevance and consequence during this crucial time.

## **b07RN18 - The Media, Protests, Social Movements and Struggles for Alternatives in Times of Crisis**

Chair(s): John Downey (Loughborough University)

### **Peers on Peer Productions Relation to Capitalism**

Arwid Lund, Uppsala University | [arwid.lund@abm.uu.se](mailto:arwid.lund@abm.uu.se)

Wikipedia takes advantage of the networks effects using the principle of Copy Left, and by being more radically including, horizontal and flexible than normal commercial enterprises of today. It's principle of Copy Left was born as a self-defense against private enclosures; a defense which was further developed when the online peer production speeded up with the development of the Linux kernel. The practices of Wikipedia, that originate from the hacker culture, is today positioned in the midst of the new commercial-friendly web 2.0-landscape. Even if Wikipedia is a gift giving economy in the center of the project, it contains various attitudes towards commercial actors and commerciality. In this paper I will focus on the attitudes of Swedish Wikipedians towards capitalist society and its logics. Do they see

themselves as a complement or alternative to capitalism? This overall question is examined through a study of their perceived relation to the use of waged labor within the commons; labor financed by Wikimedia Foundation (since 2012 to a higher degree organized by its Swedish Chapter) and the waged labor of external actors. The co-operation of the Swedish Wikipedia with the Public Authority of Cultural Heritage (Riksantikvarieämbetet) in Sweden, where waged labor by the Swedish state is co-ordinated to edit the encyclopedia, and a contest, combined with a supplementary course, in editing of company articles by unpaid as well as paid individuals will be highlighted. My study is based on eight qualitative deep interviews.

### **The Eloquence of Occupy Wall Street: Communicative Strategies of Critical Practice**

Shawn Cassiman, University of Dayton | [scassiman1@udayton.edu](mailto:scassiman1@udayton.edu)

In describing the Occupy Wall Street movement, Judith Butler (2011) highlights the communicative nature of occupation as a tactic in social movements. "When people amass on

the street, one implication seems clear: They are still here and still there; they persist; they assemble, and so manifest the understanding that their situation is shared, and even when

they are not speaking or do not present a set of negotiable demands, the call for justice is being enacted. The bodies assembled “say” we are not disposable, whether or not they are using words at the moment. What they say, as it were, is that we are still here, persisting, demanding greater justice, a release from precarity, a possibility of a livable life” (p. 12). It is, in part, this recognition of occupation as communicative that offers particular insights into one of the strengths of new social movements and their tactics. Articulating direct action, as not simply symbolic, but illustrative of material realities, the realities of

precariousness, the appropriation of public space, and the invisible (and seemingly inevitable) nature of neoliberal policies opens spaces of opportunity for critical dialogue. Such communicative strategies resonate with people inured to the endless ‘crisis’ headlines of the immediate news cycle we inhabit. The silent march by thousands of Zapatistas is but the latest and most eloquent of such tactics. (Their argument for this choice, “To be heard, we march in silence”). Such communicative strategies hold much promise for both critical political and academic practice.

## From Outrage to Change: Gatlif’s Indignados

Sinem Aydınli, Bahçeşehir University, Istanbul | [sinemaydinli@gmail.com](mailto:sinemaydinli@gmail.com)

Based on Stéphane Hessel’s (short) book *Indignez-Vous* [Time for Outrage!], as a docu-drama, Gatlif’s the last feature *Indignados* (dir. Tony Gatlif, 2012) , is witness of the real history of Europe. By using real footages of outrage movements of Greece, Spain and France, Gatlif depicts the story of an African illegal Immigrant, Betty in *Indignados*. We see the voyage of Betty goes along with the outrage movements. Even though, she, at first, seems to be alone, she is together with the other people within those movements. Hence, the representation of Betty’s story tries to make her voice to be heard within these real protests. However, whether this film is succeed in promising the hope for both Betty and the outrage movements can be asked. As

an intellectual, a director, Gatlif tries to represent real situation of the world depending on a fictitious story of an immigrant. This immigrant is a woman and she is from Third World. In this respect, while questioning the idea of representation, the difference between *Vertreten* (re-presentation) and *Darstellen* (political representation of the other) will be inquired depending on Spivak’s well-known article, “Can the Subaltern Speak” via this film. Also, I will analyze the possibility of “speaking for other” and “speaking instead of other” depending on the discussion of Spivak. At the end, I will argue whether the hope for Other is possible and whether a film can promise a change or not.

## Close Encounters: Exploring the Political Potential of Mediated Benevolence

Jiska Engelbert, Erasmus University, Rotterdam | [engelbert@eshcc.eur.nl](mailto:engelbert@eshcc.eur.nl)

This paper explores the political potential of an emerging and mediated cultural phenomenon: ‘sacrificial fundraising by proxy’ (SFbP). That means that charities delegate parts of their fund-raising work to ‘proxy fundraisers’; citizens who donate to the charity the proceeds they generate with ‘laudable’ sacrifices.

Charitable organizations heavily rely on media texts, technologies and spaces to design and execute the initiatives and experiences of their proxy fundraisers. Critical media scholarship problematizes how media currently feature in socio-cultural practices of benevolence and in other modes of envisioning solidarity towards

others. Some scholars even propose interventions in existing communicative structures to ensure 'proper' solidarities that re-enable the pursuit of social justice. Sacrificial fundraising would then epitomize de-politicized solidarity. However, SFbP-practices constitute an existing mode for citizens to engage with issues that are inevitably political. The relief of poverty, illness, abuse or discrimination cannot be perceived in isolation from causes and consequences, especially not from the role of national state systems in their (re)production

and resolution. Moreover, the increasing withdraw of systems of public support resulting from austerity measures and neoliberal governance of allocating responsibilities to communities and the third sector have transformed sacrificial fundraising for the relief of local / national suffering into a sheer necessity. To acknowledge this transformed context, this paper proposes an understanding of mediated SFSfP-practices as culturally appropriate spaces for manifestations of people's awareness of and thoughts on a socially just national politics.

## 08JS18JS29 - Social Theory and Media Sociology Today 2

Chair(s): George Pleios (University of Athens), Csaba Szalo (Masaryk University)

### Media and the Complexities of Everyday Life: Studying Reception with Practice Theory and Positioning Analysis

Triin Vihalemm, University of Tartu | [triin.vihalemm@ut.ee](mailto:triin.vihalemm@ut.ee)

Margit Keller, University of Tartu | [margit.keller@ut.ee](mailto:margit.keller@ut.ee)

This analysis contributes to discussions on the influence of mass media content, formats and genres on everyday activities. Proceeding from N. Couldry's (2004) view that media usage practices cannot be separated from other practices, we apply the practice theory approach (Schatzki 1996, Reckwitz 2002) to study the reception and utilization of media content by its consumers. We ask how mass media contributes to people becoming re-tooled and re-skilled when previously existing external structures organizing their everyday practices are changing significantly. The empirical data were gathered in Estonia in 2012-2013, when the country switched to the open electricity market and the principles of buying electricity changed. Our analysis is based on in-depth interviews with domestic clients and diaries in which they wrote reflections on what they were hearing, reading

and seeing about this topic. We explain how the interpretations of media content and our informants' discourse intertwine by highlighting the ways in which informants made sense of new tools (electricity packages and stock prices) and skills (asking for personal offers). We use positioning analysis (Harré & van Langenhove 1999) and outline the patterns of informants' self-positionings as (smart) practitioners trying to manage their budgets under the circumstances of the ultimate price-rise and information overload. Self-positionings are considered in comparison to other practitioners portrayed in the media, e.g. smart negotiators with competing suppliers or panicky pensioners afraid to remain without electricity beginning January 1st. Finally we discuss the methodological challenges of using practice theory and the positioning approach in reception research.

## Zombies, Contagion and the Limits to Capitalist Society – The Mystification of Reterritorialisation and Deterritorialisation in the Walking Dead

Isaac Gonzalez-Balletbó, Open University of Catalonia | [igonzalezbal@uoc.edu](mailto:igonzalezbal@uoc.edu)

Swen Seebach, Open University of Catalonia | [swen.seebach@gmail.com](mailto:swen.seebach@gmail.com)

Natàlia Cantó-Milà, Open University of Catalonia | [ncantom@uoc.edu](mailto:ncantom@uoc.edu)

This presentation wants to reflect on how media contribute to shape our imaginaries and perceptions of the world by presenting a reflection on the TV series – The Walking Dead. In his *Anti-Oedipus*, Deleuze describes capitalism as an interplay between desiring machines and the body without organs that is capital. In this interplay there are two forces engaging with each other, on the one hand desires pulling and pushing forward, on the other the territorial limits that hold back the streams of desire, that break them back on a capitalist reality. If instead of Deleuze, we would use the terminology of Colin Campbell, we could also say that whilst on the one hand, we are demanded to engage with ever-new experiences to find out who we are, we never arrive at a concrete end (Campbell in Ekstrom/Brembeck). That cinema and TV contribute to shape our imaginaries of what is

possible and impossible to us as much as our moral universes, is something that has been explored by many authors doing film and media analysis (Couldry, Silverman, Mulvey and Denzin are just some examples). In fact, movies are part of our mythological structure, of a web from which we extract meaning for the weaving of our life. In our presentation, we want to reflect on one single myth, the myth of capitalism crystallized in the TV series the Walking Dead. The myth presents an apocalyptic world after the crises wherein loyalty and faithfulness is the only answer, an alternative that however is constantly threatened by the deterritorialising forces, by the Walking Dead. The Walking Dead presented as a criticism to capitalism and to the de-emotionalisation of capitalist forces, contributes we will argue to the mystification of capitalism.

## Contagion Alert: A Sociological Approach to Epidemic Films

Julia Echeverria Domingo, University of Zaragoza | [juliaed@unizar.es](mailto:juliaed@unizar.es)

Several authors (Birkenstein et al 2010; Pollard 2011) have pointed to the profound stylistic and narrative changes that have taken place in what has been branded as post-9/11 cinema. One of these distinctive cinematic trends consists in a growing fascination with contagion narratives. Films like *Blindness* (Fernando Meirelles, 2008) and *Contagion* (Steven Soderbergh, 2011), together with a vast number of other narratives depicting highly infectious viruses that spread along character networks, have invaded movie theaters and TV screens alike in the last decade. In this paper I intend to foreground the need to analyze these films in a sociocultural context of ingrained

fear and risk stimulated, among other events, by the War on Terror, the global financial crisis, and the dismantling of the welfare state. Media studies become somewhat limp for that purpose and require the aid of broader sociological approaches that explain this everyday fixation with epidemiology through the social sciences. My intention is to make use of concepts such as Zygmunt Bauman's 'liquid modernity' and Ulrich Beck's 'risk society', and complement them with relational theories associated with the network society. Following Tony D. Sampson in his work *Virality* (2011), this has become the age of contagion, characterized by the flowing of affective

infectious encounters that go beyond the biological understanding of pathogens. The final aim of this presentation is to demonstrate how film studies are enriched by the

application of these sociological theories, which add a more contextual-conscious understanding of cinematic currents.

## **Netdoms, Switching, Style Concepts from Network Theory for Researching Communication Patterns – The Case of Scientific Communication**

**Marco Schmitt**, Georg-August University, Göttingen | [mschmit4@gwdg.de](mailto:mschmit4@gwdg.de)

Seeing communication patterns as networks has become something of a common-place. But new developments in network theory have yet to be brought in close contact with communication research. Harrison White is one of the central figures of the conceptual development of network research in sociology over the last 40 years. He has taken a turn from the former purely structural approach of network analysis to an approach encompassing more of the cultural and communicative aspects of social life. Three concepts are especially interesting for communication research: These are netdom, switching, and style. The netdom concept shares some similarities with the field concepts from Bourdieu or Lewin insofar it combines structural ordering with valuation ordering, but keeps the analytical distinction in using both

words. A netdom is a social space and a social process, where interactions condense into relations and rules. The concept of switching couples these social spaces in a communication process. Switching between netdoms is what happens in specific social encounters. A switch signifies a change of rules as well as a change of the relationships. Finally, the concept of style, born from the concept of structural equivalence, integrates such switches into profiles signifying an identity. Analysing the communication patterns of a research community as their switches between different netdoms concerning their research, makes it possible to define that community as a social entity. We will show how specific scientific production styles are discernible this way.

## **Which Group and What Critique? Competing Representations of Precarious Knowledge Workers, and Theories of New Social Subjects in France**

**Cyprien Tasset**, Ecole des Hautes Etudes en Sciences Sociales (EHESS) | [cyprien.tasset@gmail.com](mailto:cyprien.tasset@gmail.com)

Precarious knowledge or cultural workers are sometimes conjured up in contemporary debates in France as an emerging new social subject gifted with a strong critical potential. Although not at the forefront of public or

sociological debates, these developments seem important to us for three reasons. First, to the extent that propositions of new social groups are opposed to more institutionalised representations of social space, they are part

of a crisis of representation. Promoters of new groups reason as if social change had been so intense, especially in the area of social space they claim to unveil, that the old categories, supported by the state, the university and statistics, had lost their grip on reality. Secondly, the social figure of the precarious knowledge worker is at the crossroads of different attempts to reestablish the link between sociology and the critique. They include: drawing attention to the fate of knowledge workers as victims of social injustice; debunking dominant myths by warning individuals against the risks and alienations of some occupations; favouring,

through new labels and descriptions, the advent of a new collective subject; or warning the public against the constitution of a mass of dangerously frustrated intellectuals. Finally, these controversies and issues of social representations and reasoning about justice (or the consequences of a sense of injustice) are an arena of production for arguments and feelings that promote or oppose social movements. Besides, they are not unrelated to reconfigurations of public policy, for example through the implementation of creative industries policies. Those are the three points we are going to develop.

## **Precarious Work, Scarce Content; The Case of Teen Magazines in Romania**

**Raluca Petre**, Ovidius University of Constanta | [ralucapetre78@yahoo.com](mailto:ralucapetre78@yahoo.com)

Who are the actors, where is agency in the Romanian teen magazines? Whose agency is it? I hypothesize that in the context of emerging mass cultural markets, a firm structure encapsulates feeble local agency in terms of the politics of content. Thus, structure can be considered the marketing department, while agency can be exerted at the level of the editorial department. I explore the politics of content, based on the sources of information and on the professional trajectories of the domestic editors of these magazines. I problematize the composition of the editorial office and the uneven distribution between the undersized stuff in charge with content and the overgrown one in charge with marketing. Further on, at the level of the editorial department, I analyze the domestic content,

versus the translated input. This paper is based on the analysis of the four teen magazines available on the Romanian market, from which three are global brands, Bravo, Bravo Girl and Popcorn. The fourth magazine is Cool Girl, a locally developed concept, that was sold to an international company once established on the Romanian market. The journalists in charge with creative input are very few, one or two at the level of each magazine, and mainly have the status of collaborators, not permanent stuff. Their status is more precarious than that of the ones in the marketing and sales departments. Thus, I argue that the locally generated editorial content becomes of minor importance in the larger framework of market maximization.

## **Digital Creativity and New Professions: Biographies in Action to Overcome the Crisis**

**Tatiana Mazali**, Polytechnic University of Torino | [tatiana.mazali@gmail.com](mailto:tatiana.mazali@gmail.com)

The paper presents the first results of an ongoing empirical research (qualitative methods) focused on digital creativity. The research starts with a study of the specific

features of digital creativity, realized within the theoretical frame of complex systems. The starting hypothesis is that digital creativity, especially when it becomes a business or an

enterprise system (creative economy), evolves and operates as a CAS-complex adaptive system. Local materiality and global network communities, the do-it-yourself and self-entrepreneurship culture, decentralized forms of explorative learning and mutual adaptation: all these are examples of the dynamics that characterize the complex world of digital culture; a culture that many consider nowadays a possible way out of the current crisis. Our project consists in two studies: a desk research on the international organizational models of digital creativity (from the East London Tech City to the Innovation hubs of the Piedmont Region) and, in parallel

to it, a field research (based on in-depth interviews and focus groups) over a sample group of young professionals of digital creativity. The paper will present the first research results derived from the following aims and objectives: – To study the “biographies” in action of digital creativity professionals; the specific features of analysis are: social and cultural profiles, digital labour culture, perception of the current crisis and approaches to overcome it. – To compare the different international organizational models of digital creativity (from the most structured to the most ecosystemic) and to produce a geolocalized conceptual map of them.

## **Turkish and British Journalism in Comparison: An Inquiry into Reporters' Labour**

Adem Yesilyurt, Middle East Technical University | [yadem@metu.edu.tr](mailto:yadem@metu.edu.tr)

This study is an attempt to examine Turkish and British reporters' labour from a critical political economy approach. With the opening up of media to commercialisation and conglomeration since 1980s, a new commercial logic has dominated journalism. However, revenues of newspapers have declined first because of the rise of broadcasting and then Internet and mobile technologies. On the one hand, circulation numbers have decreased because people started reading papers online. On the other hand, advertisement revenues of the newspapers have declined because of the increasing proportion of broadcasting, Internet and mobile advertisements. Moreover, the recent financial crises have also damaged the newspaper industry. As a result of the rising commercial logic and declining revenues, media conglomerates preferred to reduce their labour expenses while investing more in new

technology. The ratio of constant capital to variable capital, namely organic composition of capital has increased significantly. Development of information and communication technologies (ICTs) has enabled the corporations to collect news from online sources in a fast and easy way. Therefore, newspapers become full with more or less similar news from the wire services and PR activities. These trends have affected reporters' labour in a negative way. Reporters have started losing their economic and social rights in this process. Flexible and precarious work becomes the norm in the news industry. Unions have lost their members and powers as well. In this general framework, this study investigates the conditions of Turkish and British reporters with regard to working conditions and employment relationships, unionisation, and reporters' labour at the news making.

## a10RN18 - Journalism, News and Media Coverage in Times of the Big Crisis 2

Chair(s): Roy Panagiotopoulou (University of Athens)

### From Crisis to 2013 Political Election? How the EU Coverage in Italian Media Is Being Re-Framed

Marinella Belluati, University of Torino | [marinella.belluati@unito.it](mailto:marinella.belluati@unito.it)

The relevance of Europe in national governments' public agenda is becoming more crucial in time of crisis. Although European financial policies are abundantly recognised as tools to overcome the economic emergency, the lack of knowledge about the EU has not been filled up yet. In Italy, the situation is similar to that in other national contexts, with some significant differences. The first one is that Italy has been one of the most important countries involved in the EU constitution process and this has contributed to support a high degree of permissive consensus feeling, but, after the introduction of Euro, the enthusiastic sentiments are becoming negative very quickly. The second one is the crucial role of European voices to support the leadership statements of Mario Monti to replace Berlusconi's government. In the third place, in time of crisis the pressure of European

Institutions on Italian decisions has become stronger. This refrain has influenced the perception of Italian public discourses generating ambiguous sentiments. Finally, the Italian Euro-scepticism, traditionally linked to the right wing and local parties, is increasing in a grass-rooted movement, the Movement 5 Stars, and in some left parties. The aim of this contribution is to reconstruct Italian trends about Europe from the beginning of the crisis up to now by using a frame analysis approach to media discourses, to show if there has been a re-framing process about the EU. The main hypothesis are: a) in crisis' time, in the Italian media coverage the discourse tonality about EU is improving; b) this effect has been reinforced by Monti's government; c) in the 2013 Italian Electoral Campaign the issue 'Europe' could be relevant in public debate.

### Engines of Crisis? Evaluating the Role of Rating Agencies and Media Coverage

Jan R Riebling, Otto-Friedrich University Bamberg | [jan.riebling@uni-bamberg.de](mailto:jan.riebling@uni-bamberg.de)

Raphael H Heiberger, Otto-Friedrich University Bamberg | [raphael-heiko.heiberger@uni-bamberg.de](mailto:raphael-heiko.heiberger@uni-bamberg.de)

On the 16th January 2013 the EU-parliament voted in favor of tougher regulations for credit rating agencies. A central part of these new rules was devoted to limiting the rating agencies ability to evaluate sovereign debt, because those ratings were deemed to be partially responsible for the ongoing European state crisis. Politicians assumed that the valuation of states and their financial stability has subdued them to the logic of the financial

market system. We argue that this argument overemphasizes the role of the rating agencies, while ignoring the part the mass media played in the enhancement and, maybe even, construction of the crisis. Our empirical evidence concentrates on three sources: the development of credit ratings from the major agencies for selected European countries, corresponding macroeconomic indicators (including the market price of government

bonds), and, finally, an extensive sample of newspaper articles regarding those ratings. Using methods of quantitative linguistics as well as time series analysis, we try to model the flow of information between ratings, market trends, and mass media. We find that rating agencies do not simply lead the way in assessing the financial stability of a country, instead they seem to follow the medias'

evaluation. The markets also tend to be much more independent of ratings as was the case before the crisis. Yet they still remain closely linked to the information supplied by the mass media. This casts doubt on the effectiveness of regulating the rating agencies while keeping states, their reputation and the financial markets closely intertwined in a discourse carried by the public opinion.

## **Irish Print Media Coverage of the Public Sector at a Time of Economic Crisis: An Analysis of Discursive and Organisational Practices.**

**Aileen M Marron**, University of Limerick | [aileen.marron@ul.ie](mailto:aileen.marron@ul.ie)

In response to the collapse of Ireland's public finances in 2009, the Irish government established a review board called the 'Special Group on Public Service Numbers and Expenditure Programmes' to identify where savings in public expenditure could be achieved. It advocated reform of the public service by substantially reducing employment numbers and the public sector pay-bill. Since 2009 changes to the public service have been covered extensively in the Irish media. However, concerns have been raised amongst trade union organisations that print media coverage of the public sector has become increasingly negative, serving only to deflect attention away from the principal causes of the economic crisis. In light of this, this paper uses framing theory to examine the ways in which media professionals have constructed stories

regarding this subject. It adopts a political economy perspective to explore the extent to which the structure of the Irish print media system may influence this content and uses critical theory to consider whether in the creation of news texts, the journalist reproduces an ideological perspective that is reflective of the dominant power structures in Irish society. By using this combination of approaches, this paper argues that there is the potential to provide insight into both the social and institutional contexts of how meaning is produced. This, when combined with an analysis of the structural and symbolic elements of news content, can offer a more holistic and nuanced understanding of the role of the media in shaping public discourses regarding the crisis.

## **Creating an Image of Power in the Russian Media in Covering Large-Scale Terrorist Attacks.**

**Maria A. Semenova**, Moscow Institute of Business and Law | [annasem62@yandex.ru](mailto:annasem62@yandex.ru)

The paper presents an analysis of the editorial policy of the Russian mass media for constructing power's image during the lighting of large-scale terrorist attacks in 2002, 2004 and 2011. The analysis is based on secondary data of content-analytical researches. Purpose – a comparative analysis of the media's activity

in situation of terrorist attack, the identification of possible stable patterns and changes in the editorial policy of the past ten years. The problem is that the formation of a negative image of power, which is one of the main actors in a situation of social conflict on a large scale terrorist attack, increases social tensions

and disrupt the political stability in society. The emergence of the society in such situations the atmosphere of mass anxiety and high levels of emotional arousal may go further if it is heated by media. This can manifest itself in the formation of a negative image of power, which is due, first, the desire to enter the media to resonate with the emotional and psychological state of the public consciousness, and secondary, the fact that negative information is

selling very good. This editorial policy helps terrorists to get one of their main objective - to violate the stability of the society. As a consequence, the media become an instrument of influence of terrorists on power structures and on society as a whole. So it seems important to analyze media's activity in terms of the constructing of a certain image of power while covering terrorist acts.

## **b10RN18 - The Public Sphere in Times of Crisis**

Chair(s): John Downey (Loughborough University)

### **Communication, Censorship and Freedom of Expression Today**

**Maria Cristina C. Costa**, University of São Paulo (USP) | [criscast@usp.br](mailto:criscast@usp.br)

In the year 2000 we have started studying censorship based on the Miroel Silveira Files from the library of the School of Communication and Arts of the University of São Paulo. It gathers more than six thousand prior censorship processes to the theater, from 1930 to 1970, reunited by the censorship service of the Public Entertainment Division associated to the State of São Paulo's Secretary for Public Security. Such processes allowed the study of censorship over communication and the arts and the result is reflected on our publications, seminars and on the collaborative interface developed in order to disclose the documents, available at [www.obcom.nap.usp.br](http://www.obcom.nap.usp.br). Western modernity has witnessed censorship as a State's political action, part of its administrative apparatus. By the end of the XXth century such administrative resource of authoritarian nature

had been gradually extinguished in fairly all western countries and the control over the divergent thinking was performed then by means much more difficult to identify and fight against. Our research with the Observatory of Communication, Freedom of Expression and Censorship is intended to build new archives of scientific nature, making records for the future of censorship practices in our actual historical time of which we are both researchers and testimonies. Based on a qualitative driven and multidisciplinary methodology it is able to integrate the tradition from different fields, journalism, audiovisual documentary, anthropology and ethnography to new collaborative possibilities of the digital network communication. Our theoretical foundation gathers authors as M. Foucault, R. Darnton, T. Todorov, E. Hobsbawn, J. Petley, B. Sousa Santos, N. Porto, among others.

## Legitimation Crisis and Journalistic Critique: the Case of Public Service Broadcasting in Ireland

Mark P Cullinane, University College Cork | [mark.cullinane@umail.ucc.ie](mailto:mark.cullinane@umail.ucc.ie)

If a legitimation crisis of the modern democratic state existed, what role would journalism play in such a crisis? This paper is premised on the idea that the present multiplicity of concurrent crises (including financial, economic, democratic, and ecological) entail a legitimation crisis not only of the democratic state but of supranational governance. It is argued here that public service media deserves particularly close critical attention as a site of critique at this time, given its special claim of indispensability to the democratic process. Ireland's particular complexion of crisis, given its status not only as a ground zero of European economic collapse since 2008 but also the scene of a widespread dissolution of institutional authority, positions it ideally for an exploration of public service media's role in facilitating critical and alternative views of the crisis. Drawing on the author's ethnographic work in

the Irish public service broadcaster's newsroom as part of his ongoing PhD research, this paper argues that as a consequence of the interplay between journalism's professional norms, the exigencies of news production, and the privileging of political and economic elites in framing coverage, Irish public service broadcasting's ability to diverge from hegemonic articulations of crisis is substantially diminished- thus exacerbating the crisis of legitimation which as a consequence cannot fully break into the public sphere and be worked through to a conclusion. The paper concludes by offering some initial thoughts on identifying the conditions for critical reporting of crises, which it is argued here must entail a radical reorientation of (public service) journalism's relationship with the democratic polity.

## Economic Hegemony and the Transformation of the Public Sphere. The Role of Economic Arguments in Theory and Practice

Matthias Lemke, Helmut-Schmidt-University, Hamburg | [matthias.lemke@hsu-hh.de](mailto:matthias.lemke@hsu-hh.de)

Claudia Ritzi, Helmut-Schmidt-University, Hamburg | [ritzi@hsu-hh.de](mailto:ritzi@hsu-hh.de)

Gary S. Schaal, Helmut-Schmidt-University, Hamburg | [gschaal@hsu-hh.de](mailto:gschaal@hsu-hh.de)

Research shows that marketization has considerably influenced political decision-making in Western democracies in the past decades: deregulation, privatization and public private partnerships gained importance. However, little research has been done on the impact of marketization on the public sphere, even though in Western democracies, where political representatives are accountable to the citizens, marketization must be reflected not only in policies but also in the public sphere.

Our paper closes this academic void by studying – theoretically and empirically – the effects of marketization on the German public discourse since the 1970's. We proceed in three steps: First we develop a definition of marketization that helps to better understand the connection of capitalism and political communication in the “neoliberal age”. Marketization is a kind of reasoned political decision-making that significantly tends towards market logics. In the long run it

reduces the contingency of political reasoning, because arguments corresponding to market logic gain influence and may become hegemonic, while non-economic arguments lose their relevance. In a second step we present results of our empirical research. With the help of text mining-tools that enable us to do a semi-automatic full-text-analysis, we analyze 3.5 million newspaper articles. The

proportion of economic arguments in the German political discourse has risen substantially and we show which policy fields are most significantly affected. We close with a discussion of our results. Here we argue that the marketization of the public sphere in the long run will endanger its functionality and therefore has to be interpreted as a severe challenge to contemporary democracies.

## **Ireland and the Online Public Sphere: A Discursive Production of (Post-)National Identity?**

**Paul Candon**, Trinity College, University of Dublin | [candonp@tcd.ie](mailto:candonp@tcd.ie)

The concept of online public sphere is by now a useful, well-rehearsed (and indeed contested) possibility for conceptualising spaces of mediated discourse and their potentialities. In Ireland, simultaneous to the localised and globalised 'crisis', numerous online sites of public commentary have emerged, creating platforms for the social production of discourse. Mobility, mediatisation, cosmopolitanism and identity politics arguably cloud the waters of national identity 'production', yet conversely this is advanced in a taken-for-granted manner by official discourses for the economic imperative – the 'branded nation' surfaces in a complex and competitive global marketplace. Engaging with the concept of online public sphere, and utilising the lens of cultural sociology, this paper provides an analysis of content from a number of discursive platforms with a focus on

the self-perception of nationhood and the internal and external gaze. It uses qualitative data and critical textual analysis. The language component is regarded as the crucial element. These discursive processes occurs within an environment characterised as both 'liminal' and highly cosmopolitan, at once traditional and modern – a 'collision culture' (Keohane and Kuhling 2004, 2007). Meanwhile, the composition of the 'national' media is undergoing a redefinition with nascent communicative technologies shifting the production of news and public discourse and altering established agenda setting practices. This paper problematises and explores the developing online sphere in Ireland with reference to selected topics of public concern and seeks to add to the sociological literature by both examining media ecology in Ireland and considering identity production.

## RN19 - Sociology of Professions

### a01RN19 - Education Professionals in Changing Times

Chair(s): Jens-Christian (Smeby, Oslo), Akershus (University College of Applied Sciences)

#### Being a Teacher in the Midst of Managerialist Reforms: Histories and Representations of Secondary School Teachers

Patrícia S. Santos, ISCTE-IUL, Lisbon | [ana.patricia.santos@iscte.pt](mailto:ana.patricia.santos@iscte.pt)

Alan Stoleroff, ISCTE-IUL, Lisbon | [alan.stoleroff@iscte.pt](mailto:alan.stoleroff@iscte.pt)

In line with the reforms occurring in European education systems and in the context of progressive economic austerity, Portuguese national education policies have converged with the  $\frac{2}{7}$  new public management and have lead to a restructuring of teachers' work. Understanding the concept of profession as a dynamic and social construction, it is important to understand how these reforms have provided the stage for conflict and negotiation and have been projected into teachers' professional consciousness, by drawing an updated a picture of the profession from the inside. To this end, this research worked up the Life Histories of a group of 17 secondary school teachers from the Lisbon area. It takes off from a theoretical model which involves the influence of the various agents (namely, the state and the collective professional actors,

whose function is to disseminate discourses and representations) upon biographical dimensions shaped by professional experience and participation in professional associations and unions in order to unravel the meanings attributed by teachers to the profession. We portray professional paths marked by frustration with expectations and situations of vulnerability that erode professional commitment, especially in case of veteran teachers and those who actively participation in unions. We conclude that a common collective resistance identity does not exist within this professional group and that pragmatism - as teachers seek to adapt to new working conditions, can forge a new profile for teachers' identity, that of teacher-employees who are willing to give up professional prerogatives.

#### Dynamics of Occupational Status of Preschool Educators in the Education Reform

Olesya V. Yurchenko, Department of Sociology of Professions and Professional Groups, Institute of Sociology (RAS) | [olesya@mail.ru](mailto:olesya@mail.ru)

Anna Valeryevna Semenova, Institute of Sociology (RAS) | [mansurov@isras.ru](mailto:mansurov@isras.ru)

We have undertaken an expert qualitative research of preschool educators in four Russian cities, including Moscow. The social status of preschool educators is inconsistent. This occupation acquires a low prestige and authority, despite its socially important role.

The reason for this can be found in the indistinct nature of the essence, structure and boundaries of the expert knowledge in the preschool education. There is also a lack of clear inner and outer criteria for the estimation of the outcomes of occupational activities. The

state officially proclaims the politics of professionalisation from above of the researched occupational group. The official authorities declare the rise of economic resources of preschool educators and the changes in the content of their job. They also foster the formation of an open and collegial system of management of the preschool education. However, these state reforms have not been effective so far, except for the rise of salaries of the public kindergarten teachers in Moscow. Preschool educators in the private sector have a higher prestige and income. They

have more chances for the upward social mobility. At the same time, they lack a sense of collective identity and common interests, as a result they cannot change the overall situation in the preschool education. The private sector gives an opportunity for an individual professionalisation, whereas the status of occupational group remains unchanged. Trade unions of preschool teachers are preoccupied with the juridical protection of individual employees. They cannot redefine the social and occupational status of the group.

## From the Black to the Whiteboard. The Digital Revolution and Teacher's Professional Field

Marco Pitzalis, University of Cagliari | [pitzalis@unica.it](mailto:pitzalis@unica.it)

Antonietta De Feo, University of Cagliari | [antonietta.defeo@unica.it](mailto:antonietta.defeo@unica.it)

This paper reports the first results of a research using quantitative and qualitative methods in a sample of elementary and high schools in Sardinia interested by the introduction of the interactive whiteboard. We focus on the relation between the introduction of this technology and the transformation of disciplinary culture and professional practices. Assuming the praxeological perspective of Pierre Bourdieu, we analyse how teachers manage the technological change in respect with their "habitus" (educational, cultural and disciplinary) and with the socio-spatial configuration of their school. First, authorities impose this innovation in order to produce changes in school educational practices. Second, the introduction of a new technological frame seems to threaten the traditional basis of institutional legitimacy of teacher's authority

within the class, especially with respect to the monopoly on the legitimate knowledge. The presence of "digital natives" in a more "dialogic" and "interactive" learning environment is perceived as a way to reverse the practical and symbolic asymmetries between teachers and students. Furthermore, the "resistance" is rooted in profound disciplinary and pedagogical cultures and habitus influencing the perception and the use of technologies. For example, we observe, a general opposition between foreign and classical languages teachers. The first group is more likely to adopt new technologies within their teaching methodologies; the second group, on the contrary, is inclined to avoid the use of these tools or to use them reproducing the traditional pedagogic methods.

## The Recruitment to Teacher Education and the Teaching Profession in Sweden 1978-2008

Emil Bertilsson, Uppsala University | [emil.bertilsson@edu.uu.se](mailto:emil.bertilsson@edu.uu.se)

The recruitment to teacher education and the teaching profession has been a widely debated issue in Sweden during the last 10-15 years. The decreasing professional status of teachers and the fact that fewer students regard the teaching profession as an attractive occupational choice has been in center of this debate. This presentation includes analysis of the recruitment patterns to teacher education and the transmission from education to work focusing on differences in the teacher students social and meritocratic resources – referred to as inherited and acquired capital. A relational approach is applied treating different teacher education programs as a part of a field of higher education, and thus focusing on differences between different teacher education programs (regarding their professional orientation) as well as other higher education study programs. The results

show that during the last twenty years, teacher education recruitment patterns have changed dramatically. Especially noticeable is the increasing share of students with small amounts of acquired school capital and shifting social origins among the teacher students. The students' meritocratic resources have a strong impact on their inclination to choose a teacher training programme; those with good credentials reject this programme irrespective of their social background. The dramatic changes in recruitment patterns are especially visible within the teacher education programmes that earlier were characterized by more selective recruitment, i.e. programmes for subject teachers in upper secondary schools. Concluding remarks are then made on how these changes influence the relation between teacher education and the teaching profession.

## b01RN19 - Health Professions in Transition

Chair(s): Bridget Roe (University of Nottingham)

### Professionalization as a Legitimization Strategy – Advantages and Limits. Evidence from the Bulgarian Health Sector Transformation

Alis Sopadzhiyan, Centre for Research on Political Action in Europe (CRAPE), CNRS, Rennes 1 University, Science Po Rennes, EHESP | [alis.sopadzhiyan@gmail.com](mailto:alis.sopadzhiyan@gmail.com)

The Bulgarian health care system has been experiencing a profound crisis since the reform of the late 90s introducing a new regulation system in the health sector. It affected the system in various ways: it created the National Health Insurance Fund (NHIF); reconfigured the national actors' constellation; provided the Bulgarian medical organization (BuMA) with

new functions and responsibilities; and redefined the medical profession, its internal structure and its practice. These transformations have been accompanied by a parallel process of delegitimization of the new institutional actors involved in the health care system, such as the NHIF and the BuMA, which also affected the medical profession. In this

paper we will concentrate on the BuMA's (re)legitimation strategies directed to the other institutional actors, to the members of the profession and to the public/patients. These strategies are based on the managerial tools introduced by the reform and provide a means of professionalization to the BuMA since they introduce scientific criteria recognized as legitimate by all the actors implied in interaction (Kuhlmann et al 2009). We will demonstrate that this strategy results to be in part successful as far as the BuMA internal

pragmatic and cognitive legitimacy (Duran et Le Bianic 2008) in relation to the other institutional actors and the medical profession are concerned. But, its external pragmatic and normative legitimacy (ibid) in relation to the public remains problematic. This confirms the hypothesis that occupational professionalism can be supported by standardized procedures and practice (Evetts 2011). But, as far as trust is into question, relational continuities play an important role and challenges remain.

## **Conformity and Critical Distance – About Professional Identities of Medical Professionals within the Pharmaceutical Industry.**

Christiane Schnell, Goethe University, Frankfurt | [ch.schnell@em.uni-frankfurt.de](mailto:ch.schnell@em.uni-frankfurt.de)

The empirical field focused in this paper are doctors working in the area of biomedical research in the pharmaceutical industry. The professional identity of doctors and medical scientists working in this field is in the majority of cases affected by a professional experience in clinical practice and pure and applied research, before switching to a position within industrial research. The question raised is, in how far disciplinary and ethical values and economic forces of the pharmaceutical research and development come into conflict

or not. Biomedical research on cancer-diseases is focussed, because this field represents distinctive contradictions between medical curing interests and the pressures of a branch, which is driven by shareholder value, high level investment risks and increasing international competition. In a theoretical perspective it is supposed, that this is exemplary for a contemporary type of professionalism, which is legitimising professional knowledge and values within intensified economic constraints.

## **Revalidation as Healthcare Professional Regulatory Reform. Professional Crisis, or Critique and Change Opportunity?**

Zoey A Spendlove, University of Nottingham | [zoey.spendlove@nottingham.ac.uk](mailto:zoey.spendlove@nottingham.ac.uk)

Healthcare faces many challenges requiring the balancing of economy, efficiency and effectiveness with clinical care requirements and consumer expectations. Within this context there are widespread calls for tighter regulation of healthcare professionals, resulting in the birth of a 'revalidation' policy within the UK. Revalidation, as regulatory reform, represents the biggest policy development in the history of UK health professional regulation (Archer et al 2012).

This paper will present findings of a Doctoral ethnographic research study observing the real time implementation of revalidation within an English NHS maternity services department. Exploring revalidation as crisis and evoking questions of the historic profession-state 'regulative bargain' (Cooper et al 1988), this paper discusses the challenges that revalidation presents to the historic culture of collegial self-regulation and its subsequent impact upon inter-professional relationships

and dynamics within Maternity Services. In addition, this paper investigates the potential of professional groups to utilise the revalidation process as a point of self-reflection, providing an opportunity for 'health professions as change agents' to reconstruct a new form of collective regulation, as a strategy to reaffirm their 'regulative bargain' and 'professional project' (Larson 1977). In doing so, it will

compare the relative position of medics and midwives to engage agentially with the imposed policy framework and shape it in their own interests. This paper concludes with theory development about the way in which regulatory mechanisms, such as revalidation, are utilised as part of 'professional project' pursuits and claims of professional mandate (Hughes 1958).

## **General Practitioners' Professional Identity and Health Policy in a Time of Crisis: the French Case**

Géraldine Bloy, University of Burgundy | [gbloy@u-bourgogne.fr](mailto:gbloy@u-bourgogne.fr)

Laurent Rigal, Paris Descartes Univ | [laurent.rigal@parisdescartes.fr](mailto:laurent.rigal@parisdescartes.fr)

After a presentation of the French primary care context (GPs belong to the private sector, work alone, receive fees for service; public health issues are barely established but public insurance supports the refunding of the fees), we will focus on the recent turn in health policy concerning this professional segment and its integration into health institutions. The economic crisis is considered by the authorities (the State and the public third party payer) as an opportunity to reshape the way GPs work and to influence the professional model by reallocating means. Medical work is more constrained and GPs are asked to become accountable for its quality and cost. This turn is driven by the policy makers and not by the professionals themselves, who might fall behind. How do private GPs' respond to these public regulation attempts? How does it affect their professional identity or traditional

autonomy? How do they cope with the current inflections of their mandate? Is the unity of this professional group threatened? Our analysis is empirically based on a qualitative study (100 interviews) focused on preventive care (which is especially concerned by these changes). Some GPs present themselves as opponents, but others are resigned or try to negotiate this managerial change. Considering GPs' historical lack of legitimacy, a deal between a better recognition/integration of their practice and new constraints sounds tempting for some of them. The New Public Management is experienced by health professionals in many countries but we try to understand to what extent the French national context (cultural, technocratic or democratic) influences its application: are they specific stakes and levers available for the profession?

## **Changes in the Availability of Psychological Therapies in Europe and the Turbulent Relationship between Corporate Rationalisers and Professional Monopolists**

David Pilgrim, University of Liverpool | [david.pilgrim@liv.ac.uk](mailto:david.pilgrim@liv.ac.uk)

In the second half of the 20th century the largely private and highly variegated market of psychological therapies increasingly became a

matter of policy debate in relation to its evidence base and its availability to the general public. By the turn of this century the latter

availability increasingly became a matter for European governments, who wanted to both resource and regulate psychological technologies in health settings. This paper will focus on the Improving Access to Psychological Therapies initiative in the UK and compare it to related events in France and the Netherlands. At the centre of these faltering policy debates and initiatives was a recurring tension, between those wishing to improve service efficiency and those wishing to retain

professional authority over their traditional and preferred ways of working. The turbulence this tension has created is explored in this paper by adopting Alford's concepts of 'corporate rationalisers' and 'professional monopolists' as a starting point. This exploration also brings into question the very point of these technologies in modern society and problematises the taken for granted notion (for many policy makers) of evidence-based policy formation.

## **b0219JS16 - Patients, Citizens and Professionals in Europe: Modern Health Care Societies in Crisis**

Chair(s): Gunnar Scott Reinbacher, Ruth McDonald

### **Increasing Mobility – Reaction to the Crisis?**

**Eszter Kovacs**, Semmelweis University, Budapest | [kovacs.eszter@emk.sote.hu](mailto:kovacs.eszter@emk.sote.hu)

**Edmond Girasek**, Semmelweis University, Budapest | [girasek@emk.sote.hu](mailto:girasek@emk.sote.hu)

**Gabor Szocska**, Semmelweis University, Budapest | [szocska.gabor@gmail.com](mailto:szocska.gabor@gmail.com)

**Miklos Szocska**, Semmelweis University, Budapest | [szocska@emk.sote.hu](mailto:szocska@emk.sote.hu)

Health professionals and patient mobility gets wider attention in contemporary research, since mobility has showed increasing volume in the last few decades. Due to the EU legislation 2005/36 Directive ensures the mutual recognition of qualifications, thus, mobility of health professionals is facilitated within the EU; further, 2011/24 Directive on patients' rights in cross-border healthcare might trigger patient mobility, that is, patients traveling with the intention of obtaining medical services, treatments abroad. The aim of the present paper is to explore the motivational background and key drivers of health professionals' and patients' mobility based on the findings of ECAB research project. Qualitative in-depth and focus group interviews were conducted with health professionals on the key drivers for mobility. Motivational background of patient mobility

was measured by patient survey and patient experience interviews. Additionally, official statistics and previous survey results were reviewed. Health professionals stated that licensing procedures do not differ in EU Member States that might facilitate mobility. Moreover, of the motivational factors financial opportunities, future perspectives, prestige, organization culture and special technology are underlined. From the patients' aspect, mobility of is often based on affordable prices, better quality, avoiding waiting lists and combination with vacation. As a conclusion we emphasize that financial reasons are significant factors behind both forms of mobility. The crisis itself brought uncertainty and financial difficulties into people's lives, thus, health professionals and patients tend to mobilize themselves to save while entering health systems abroad.

## Consequences of Italian Healthcare Reforms on Medical Profession

Federico Sofritti, University of Florence | [federico.sofritti@gmail.com](mailto:federico.sofritti@gmail.com)

Healthcare has changed a lot during the last decades of the Twentieth century within Western societies: reforms have been implemented to face the increasing challenges of health systems in a context of crisis of the welfare state's bedrocks. The most important issue of these reforms is the introduction of market's principles in public work organizations; as a result, the logics of work in healthcare have changed. The focus of my research is on the consequences of health reforms on medical doctors' professional identity, particularly with the introduction of 'organizational professionalism' in a context characterized for decades by 'occupational professionalism': organizational techniques such as New Public Management emphasize the distinction between managerial and professional mentalities and ways of working. The aim is to cope with the hypothesis that

organizational transformations introduced with the 'commodification' of healthcare affect several dimensions of doctors' identity such as the general concept of profession, professional ethos, and Medical Dominance, letting appear a new medical professionalism. My presentation deals with the findings of an empirical study based on semi-structured interviews involving two groups of doctors: the former socialized before the Nineties' reforms and the latter in post-reforms Italian health system. The area of study is a Tuscan 'District', local health organization which has acquired increasing organizational autonomy and significance as Primary healthcare (Phc) institution. I will stress the impact of managerialism and consumerism on professionals' autonomy, the relationship between doctors and managers, and the modification of medical skills.

## Long-Term Healthcare in Europe: How to Staff the Future Health Professional Workforce?

Ellen Kuhlmann, University Siegen | [e.kuhlmann@em.uni-frankfurt.de](mailto:e.kuhlmann@em.uni-frankfurt.de)

Christa Larsen, Goethe-University, Frankfurt | [C.Larsen@em.uni-frankfurt.de](mailto:C.Larsen@em.uni-frankfurt.de)

Long-term care (LTC) is one of the most challenging policy areas in European countries. Despite growing awareness of the problems and improved data, existing institutional reforms do not respond effectively to demographic change. This paper provides an overview of the challenges of future health human resources in LTC in Europe; we focus on the nursing workforce and a systematic connection of contemporary and prospective analyses of the use of LTC services/demand and LTC professionals/health human resources. In terms of method, we draw on secondary analysis of the literature and analysis of public statistics, especially OECD data. The European approach brings high

variation in future demand for LTC into view. Especially problematic are countries, like for instance Germany, where a number of problematic trends combine and create a negative scenario: a growing demand for LTC meets with decreasing health human resources on the supply side. The situation is even worse in several central-eastern European countries, like for instance Poland, where migration of health professionals widens the gap between demand for services and human resources. We conclude by suggesting intervention strategies that may reduce problematic dynamics of demographic change, health policy and geo-political conditions.

## Italian Dentistry and the Crisis: How Profession is Changing

Elena Spina, Marche Polytechnic University | [e.spina@univpm.it](mailto:e.spina@univpm.it)

Giovanna Vicarelli, Marche Polytechnic University | [m.g.vicarelli@univpm.it](mailto:m.g.vicarelli@univpm.it)

Emmanuele Pavolini, Macerata University | [e.pavolini@unimc.it](mailto:e.pavolini@unimc.it)

The Italian dental sector comprises 54,110 dentists, of which 3,500 work for the public health system or in contracted structures, while the majority works in the 41,000 private dental practices scattered across the national territory. Only 12.5% of patients is treated in public or semi-public facilities, 5% receive completely free dental care and 86% have to pay totally out-of-pocket for their dental treatment. For some time this sector has been experiencing some very difficult challenges to the traditional systems that have existed for years. These challenges come from different interacting factors mainly attributable to the economic crisis. On one hand, since dental treatments are predominantly provided by private practitioners, the average annual number of dental visits has decreased in particular since 2008. On the other hand dentists are seriously exposed to the market as

they are facing an increasing amount of competition that low cost franchising multinationals had brought into the Italian market. It also concerned with the increasing phenomenon of dental tourism through which individuals are seeking dental care outside of the Italian healthcare system. Using available national and European statistical data as well as the main results of empirical qualitative research, the paper focuses on the effects of the economic crisis on the dental profession. Two analytical dimensions will be explored. On one hand, we will try to evaluate the effects of the economic crisis in terms of reduction of oral health-related consumption and the related social inequalities. On the other, we will focus on professional strategies that Italian dentists are developing in this period to respond to change.

## Crisis, Marketization and Changes in the Professional Ethics of Medical Doctors

Evelien Tonkens, University of Amsterdam | [e.h.tonkens@uva.nl](mailto:e.h.tonkens@uva.nl)

Margo Trappenburg, University of Amsterdam | [m.j.trappenburg@uva.nl](mailto:m.j.trappenburg@uva.nl)

Under pressure of rising costs and the global and financial economic crisis, many European governments try to reduce spending and increase efficiency by fortifying marketization of health care. Marketization is supposed to increase efficiency and service-mindedness but otherwise be neutral when it comes to professional ethics. In this paper we study this claim empirically, focusing on medical doctors in the Netherlands. How does marketization of health care influence professional ethics of medical doctors? Based on in-depth interviews with 85 medical specialists from five specialisations with varying degrees of marketization (general practising, surgery,

internal medicine, child medicine and anaesthesiology) we found that their professional ethics is seriously influenced in four respects. They are indeed more concerned with efficiency and patient friendly behaviour, as was intended. However, their ethics is also influenced in three less desired and intended ways. First, they spend more time and energy on advertising. Second, they move their attention from distribution according to need towards distribution according to expected profit. Third, for most of them - surgeons excepted - the harm principle is less prominent in their daily practice; they spend less time talking (to prevent or postpone

potentially harmful medical interventions) and more quickly turn to medical interventions. On account of these last three factors, many of them are critical towards marketization.

However, they feel they can exercise very little influence on the process, and therefore are not tempted to raise their voice.

## **a02RN19 - Academia and Professions**

Chair(s): Lisa Wallander (Centre for Profession Studies - Malmö University)

### **Adopting to a Changing Academia? Career Strategies of Young Sociologists within Institutional Change, Professional Myths and Academic Pressures. Five National Sociologies in a Comparative Perspective**

Tatjana Zimenkova, Bielefeld University | [tzimenkova@uni-bielefeld.de](mailto:tzimenkova@uni-bielefeld.de)

This paper presents the results of a comparative study of academic labour markets in five national sociologies (Britain, Germany, France, Russia and USA) and focusses on the special challenges, young academic professionals in social sciences face in their career (planning). The paper shows the perception of "classical" instruments for professional success within academia, as perceived by young and experienced scholars and discusses the changing opportunities and perceptions of successful strategies within academia of five countries. The empirical results of the research point to the the perception of institutional change as a main challenge and uncertainty of their future profession as a common denominator, uniting career narratives and (reported) strategies within academia of different counties, different scientific communities and (?different?)

academic labour markets. The presentation demonstrates the specifics of academic profession on a cutting edge of economic uncertainties and crises, changing /marketization of academia and (?invariable?) mechanisms of proving one's professionalism and criteria of "success" evaluation within academic profession in social sciences. Further on the presentation poses the question, what do established academic professionals, sociologists and social scientists, occupying key positions of professors, deans, vice-rectors and journal editors understand under sociological profession and what do they expect from future colleagues, which kind of barriers and social closures they as key actors produce for sociological career and whether these closures are compatible with the changing university.

### **Universities, Disciplines and Intellectual Ideals of Action for the Administrative Superstructure in Chile**

Nicolas G Fleet, University of Cambridge | [ngf22@cam.ac.uk](mailto:ngf22@cam.ac.uk)

Amidst the tendencies of state decentralization in Chile, this paper proposes that the normative foundations ensuring the operation of instrumental bureaucracies are developed in

the universities and disciplines that educate intellectual labour and provide the motivation to project it, through the expectation of certain ideological effectiveness, onto society's

administrative superstructure. Intellectual labour in bureaucratic organizations is academically socialized as a special form of social action capable to mobilize normative orientations through instrumental means, therefore it cannot be reduced to purely technical performance and, given the trends of massification of higher education, its ideals are not an exclusive attribute of a ruling elite. Drawing on Habermas' scheme of knowledge interests (technical control, recognition and emancipation), this paper conceptualizes the normative differentiation of intellectual ideals that connect disciplinary education with professional practice. To understand the ideological function of universities and

disciplines in the reproduction of intellectual action in Chile, interviews with 29 academics teaching in professional programmes based in social sciences, humanities and technological disciplines are analyzed. Research findings suggest that segmented selectivity and stratification of the university system (mass, intermediate and elite) constraint the opportunities for professional status and intellectual leadership. In addition, universities and disciplines are also ideologically differentiated (organic/non-organic), implying specific articulations of intellectual ideals of action to social interests, with pretensions of impact on fields of policy administration.

## From Network to Market: A Comparative Analysis of Mechanism of Position Allocation in Academic Profession

Mikhail Sokolov, European University, St. Petersburg | [msokolov@eu.spb.ru](mailto:msokolov@eu.spb.ru)

One of the major aims of economic neoinstitutionalism since Coase is explaining prevalence of certain type of coordination mechanism (bureaucracy, network or market) within a given area of exchange. The present paper poses this question about organization of labour market for social scientists. It seems that the personalistic patronage networks, which universally were central in allocation of academic positions two or three generations ago, in some academic settings lost their prominence (e.g. the US), while in other recently grew even more salient (e.g. Russia). This paper reports the results of a historical-comparative study of institutional dynamics of academic job markets in five sociologies (British, French, German, Russian, and US) over the last 50 years. The study relied on secondary analysis of research literatures, study of historical sources, labor market

statistics, and 60+ narrative interviews. A variety of institutional-economic (Williamson, Ouchi), institutional-organizational (Meyer, DiMaggio), demographic (Abbott), and structural-informational (Alchian, Spence, Akerloff) hypotheses were considered. The project ended with a narrative which combined elements of several of the initial hypotheses. It seemed that crucial factors were (a) the degree the universities were dependent on tuition as their economic basis, and dominant motivation among the students studying social sciences; (b) the nature of units of perception and decision making involved in reaching employment decisions; (c) real estate pricing and general labor mobility. This narrative explains while policies of the Russian state, aimed at suppression of network-structured academic establishment, failed

## **a03RN19 - Boundaries, Barriers, Coherence and Fragmentation in Professional Contexts**

Chair(s): Mike Dent (University of Staffordshire)

### **Inter-Professional Collaboration in Challenging Times: Addressing the Crisis in Health and Social Care in the UK**

Mike Saks, University Campus Suffolk | [m.saks@ucs.ac.uk](mailto:m.saks@ucs.ac.uk)

This paper considers the role that increasing inter-professional collaboration may play in addressing the developing social, political and economic crisis through a case study of health and social care in the UK. This theme is addressed in the paper in a critical manner at a number of levels. The first level considers the nature and definition of the crisis and what this has meant for changing service delivery parameters in the UK – not least in terms of the ever-greater requirement for cost-effective, person centred patterns of care. The second level examines the balance of benefits and costs of inter-professional collaboration in practice both generically and in the illustrative case of health and social care. The third level

of the paper considers the extent to which it is genuinely possible to increase inter-professional collaboration in health and social care – even in the context of such changes as the recent inclusion of social workers in the Health Professions Council (now the Health and Care Professions Council) and the passing of the 2012 Health and Social Care Act which provides a framework for greater integration of services. One major issue, amongst others, is the extent to which the creation of professions and culturally limited notions of professionalism have created silo-based obstacles to multidisciplinary inter-occupational working in the interests of the client and public alike.

### **Transitional Coherence in Teaching and Nursing**

Jens-Christian Smeby, Oslo and Akershus University College of Applied Sciences | [Jens-Christian.Smeby@hioa.no](mailto:Jens-Christian.Smeby@hioa.no)

Andre Vågan, Oslo and Akershus University College of the Applied Sciences | [Andre.Vagan@hioa.no](mailto:Andre.Vagan@hioa.no)

Professions are characterised as knowledge based occupational groups. The relationship between theory and practice is a key challenge in the development of professional competence. A common critic of professional programmes is that they lack relevance for professional practice. Studies verify that program coherence, meaningful relationships between the theoretical and practical parts of curricula, has a positive impact on students learning outcome (Grossman et al. 2008). In this paper we expand the issue of coherence. We use the term transitional coherence

(Smeby and Heggen 2012) to explore the extent to which students experience their professional education training to be a sound basis for entering professional work, to carry out the tasks in an appropriate manner and as a basis for further workplace learning. The aim of professional education is, indeed, first of all to qualify for professional work and careers. Moreover, focusing on transitional coherence opens up for exploring coherence as a matter of socialisation into the profession in a broader sense. Our hypothesis, which is partly supported by our analyses, is that students'

perceived transitional coherence is not only a matter of their learning outcome in terms of knowledge and skills, but also students' dedication to their profession and their professional identity. The paper applies a longitudinal approach focusing on two

professional groups: primary school teachers and nurses. It is based on a longitudinal data base (StudData) as well as interviews with students in their final year of study and two-three years after graduation.

## **Navigating between Career Drive and Discrimination: Ethnic Minority Students' Career Expectations in Prospective Profession**

**Bente Abrahamsen**, Oslo and Akershus University College of Applied Sciences | [Bente.Abrahamsen@hioa.no](mailto:Bente.Abrahamsen@hioa.no)

**Ida Drange**, Oslo and Akershus University college of applied sciences | [ida.drange@hioa.no](mailto:ida.drange@hioa.no)

The paper explores career expectations among ethnic minority students in professional training (bachelor degree). Two aspects of professional careers are investigated, attainment and inclusion. The focus is on last-year students of Asian origin. The study also includes majority students and minority students from western countries. The educational success for Asian immigrants in Western countries creates expectations of a strong career drive. The results reveal that immigrants' career expectation do not necessarily correspond their career preferences. Ethnicity (Asian) seems to

influence expectations of top positions negatively, but affects continuation of education positively. A master degree presumably increases the students' competitive ability in the labour market as well as the social positions of the students' family in the Asian community. Relatively low expectations regarding top positions might reflect perceived discrimination however such problems seem not to affect expectations of getting a relevant job in the beginning of the professional career. Equality in expectations of professional inclusion reflects characteristics of the professions.

## **Professional Governance and Health Human Resources Policy: Towards a European Integrated Approach**

**Ellen Kuhlmann**, University Siegen | [e.kuhlmann@em.uni-frankfurt.de](mailto:e.kuhlmann@em.uni-frankfurt.de)

**Ronald Batenburg**, NIVEL, Utrecht | [r.batenburg@nivel.nl](mailto:r.batenburg@nivel.nl)

**Peter P Groenewegen**, NIVEL, Utrecht | [p.groenewegen@nivel.nl](mailto:p.groenewegen@nivel.nl)

**Christa Larsen**, Goethe-University, Frankfurt | [C.Larsen@em.uni-frankfurt.de](mailto:C.Larsen@em.uni-frankfurt.de)

Workforce shortages and misdistribution of skills are a major problem of many healthcare systems, but no comprehensive European approach to Health Human Resources (HHR) policy exists and action remains fragmented. This scoping study seeks to contribute to the debates by providing an overview of existing HHR research, and by exploring the challenges

of a European approach with a focus on workforce planning. In terms of methods, we build on a scoping review comprising literature analysis and qualitative data gathered from policy experts. In our analysis we observe an overall lack of integrated HHR approaches as major obstacle of efficient HHR planning, and find that five dimensions of integration in HHR

policy are needed: system, occupational, sector, gender, and socio-cultural integration. Increasing the analytical complexity of HHR planning models does not automatically bring about more reliable and efficient planning, as the added value of these models is highly

context-dependant. Yet Europe is highly diverse and we therefore argue the need for a strategic HHR perspective that is capable of bridging many different HHR policies and planning systems, and combining national and European solutions efficiently.

## **b03RN19 - The Big Picture - Professions, States and Organising**

Chair(s): Lara Maestriperi (Laboratory of Social Policy / DASTU Polytechnic of Milan)

### **Professional Institutes and Associations: Crisis, Critique and Change**

Julia A. Evetts, University of Nottingham | [julia.evetts@nottingham.ac.uk](mailto:julia.evetts@nottingham.ac.uk)

The large majority of professional occupations are represented and regulated by professional institutes and associations. In addition to representing the professions members, these institutes control the standards for practitioners entered on their professional registers with respect to admission requirements, professional conduct and continuing professional development (CPD). Some are responsible for licensing and for renewing licenses for practitioners deemed fit to practice. In these respects institutes perform a 'qualifying association' activity. Some of the institutes started out as 'learned bodies' and have already been subject to numerous changes in function and purpose. The role of professional institutes has been undergoing change in response to external, state and global influences. Some institutes are facing crises of falling enrolment and

membership and this is particularly the case (as, for example, in engineering and science) where a professional licence is not required to practice. Falling memberships have sometimes been accompanied by criticism of the high costs of membership and registration and for little perceived return and benefit. The relevance of professional membership and registration is being questioned by employers as well as practitioners. Professional institutes are now having to operate in a greater collaborative context than hitherto. Professional institutes are required to adapt and change and in the process the traditional balance between learned society and qualifying association functions is subject to challenge and change. The paper will consider some of the aspects of crisis, critique and change for professional institutes.

### **NPM and Professional Subjectivity: Does the Position in the System Counts?**

Teresa Carvalho, University of Aveiro | [teresa.carvalho@ua.pt](mailto:teresa.carvalho@ua.pt)

In the last three or four decades a wave of reformist activities in the public sector have been noticed in almost all developed countries. This wave has been described and widely discussed in the literature as New Public Management (NPM). NPM is used mainly to

describe a set of new activities and management practices in the public sector that were traditionally used in the private management. NPM intends not only to change the way public institutions are organised but also professionals' norms, values and

behaviour. The aim of this paper is to examine, in a comparative way, the implications of NPM-styled reforms in the subjectivity of professional belonging to groups with different position in the system of professions, namely nurses, physicians and academics. We start with the conviction that narratives of public reform can influence the subjectivity of these professionals, aligning their behaviour with the boarder goals of governmental programme. To understand the way subjectivity is changed a qualitative study is developed with 55 interviews with academics (15), nurses (20) and physicians (20). Data analysis reveals that the

results are not simple, nor homogeneous, with distinct positions being noticed inside each group. Results reveal that professionals use the dominant discourses in complex negotiations in the construction of identity and self. A key finding from the research is that both professional groups feel professionalism is being subject to great pressures to move in towards more managerial values. But, on contrary to what was expected, due to its traditional concern with care, nurses are, in general, more aligned to change their professionalism and even to display business-like behaviours.

## Professional Associations in Russia: Between Market and Professional Community

**Alexandra Moskovskaya**, National Research University Higher School of Economics, Moscow  
| [amoskovskaya@hse.ru](mailto:amoskovskaya@hse.ru)

Professional associations in Russia are to some extent novices in contemporary professional regulation. Only small part of them can play significant role in enforcement of professional control (representing professional community in front of other stakeholders, adoption of professional standards, ensuring market closure, protection of prevalence of professional ethics etc.). Partially that comes from the lack of experience that Russian professionals have working in the frameworks of democracy and liberal economy, partially that follows tradition of state predominance in economy and society. During the last two decades a mass of organizations arose in Russia calling themselves professional associations, guilds, societies and unions. The task to understand who they are, whether they may and they ought to represent professional community and what

are their methods of control professional work became now a pressing practical problem and an interesting research task. The object of this research is mapping the field of variety of professional associations in Russia and those representing themselves as such in order to clarify the following issues: - What is the structure of professional associations by the main quality characteristics - What are their actual means and feasible opportunities to carry out professional control in their field of expertise - What are forms, directions and profundity of interactions between professional associations and universities, core state departments, employers, and their own professional community - What are the main limits of professional control they dispose and whether there are any alternative forms of professional regulation in some professional areas

## State and Professionals in Portugal: Comparing Physicians, Nurses and Academics Views on the State Intervention in Public Health and Higher Education Institutions

Rui Santiago, University of Aveiro | [rui.santiago@ua.pt](mailto:rui.santiago@ua.pt)

The aim of this paper is to analyze how different professional groups position themselves in relation to changes in states role in fulfilling social needs. Three professional groups, physicians, nurses and academics, were selected in order to understand how they positioned vis-à-vis the Portuguese State intervention in public health and higher education. The study relies on a quantitative and qualitative major research project aiming at comparing current changes in these professional groups. The empirical data used in this paper is based on a questionnaire applied to these professionals universe with middle management positions in public hospitals and higher education institutions: 750 physicians; 450 nurses and 430 academics. The overall response rate is of 30%. Data analysis is based on a single survey dimension related with the professionals' views on the State

financing and organizing role in the two sectors. Quantitative analysis reveals that almost all surveyed (98%) agree on the idea that State should assume full responsibilities in these sectors. Nevertheless, qualitative results (draw from content analysis to the survey open questions) reveal distinct meanings professionals assign to the State role. Academics highlight the importance of State as the warrant of universalism and social justice. Nurses stress the importance of the State as the warrant of the quality and regulation of public services. Finally, the State role is interpreted as the protector of public services from market interference by physicians. These results are also discussed according to their linkages to professionalism and the professionalization processes in the three professional groups.

## a04JS19JS16 - Professionals, Citizens and the Production of Health

Chair(s): Ruth McDonald (University of Nottingham)

### Implementing, Embedding and Integrating Practices: Can Normalisation Process Theory Explain Why Self-Management Support is Hard Work to Implement?

Anne Kennedy, University of Southampton | [a.kennedy@soton.ac.uk](mailto:a.kennedy@soton.ac.uk)

Anne E. Rogers, University of Southampton | [a.e.rogers@soton.ac.uk](mailto:a.e.rogers@soton.ac.uk)

Ivaylo Vassilev, University of Manchester | [lvaylo.vassilev@manchester.ac.uk](mailto:lvaylo.vassilev@manchester.ac.uk)

Improving people's ability to self-manage is a cost-saving political aspiration. The interest of sociology in comprehending how practices become embedded in everyday life has relevance in understanding implementation of patient and clinical practices in health-care

settings. This paper explores why an ostensibly "evidence-based" self-management intervention delivered in primary care failed to become normal practice. Normalisation Process Theory has utility for understanding the construction of agents' life worlds and how

technological and material practices are made doable in clinical and other settings. NPT has four constructs: Coherence – sense-making work; Cognitive Participation – relational work; Collective Action – operational work; Reflexive monitoring – appraisal work (Sociology, 43:535-554(2009)). NPT provided a framework for the work of participants and how this contributed to material health practices becoming normalised or not. We focussed on implementation of technology and tools – guidebooks for patients and using shared decision-making tools. Semi-structured interviews were conducted with 37 staff in 12 general practices. The analysis framework was

based on the NPT constructs. Only guidebooks were embedded in daily practice; they enhanced patient-centredness and were minimally disruptive to existing work. Nurses were reluctant to engage with behaviour change discussions. Financially incentivised targets were practice priorities, self-management support was not: it was not auditable; not different enough to value; considered too disruptive; and there was minimal support within the practice. We evaluate NPT's merits as a sociological theory of implementation in comparison to other theories of diffusion.

## Patient, Citizen and Participant Involvement in Health Care: Trusting the Medical Profession?

Mike Dent, Staffordshire University | [mike.dent@staffs.ac.uk](mailto:mike.dent@staffs.ac.uk)

Whereas, much of the earlier discussions around patients' and citizens' involvement in health care and health care policy has been mainly around choice this is a very limited approach. Following the work of others (e.g. Fotaki et al 2006) I extend the discussion to include 'voice' and co-production (see Dent et al, 2011) as the three key components of user involvement in health care. The interrelations between these different aspects of 'user involvement' will be discussed in relation to the issue of trust, especially in connection with doctor-patient relations. My rationale for this approach is threefold. First, the policy of 'patient choice', is not – or not solely – another name for consumerism within publicly financed health care, rather it is designed as a

deliberative process intended to give 'voice' to patients/citizens (Hirschman 1970). This is a relatively new development and the paper will explore some of the implications for the medical profession, nor the health service. Second, 'user involvement' has implications for trust relations within health care. On the one hand, 'responsibilisation' of users may lead to increasing questioning of trust. Conversely the same trend may lead to proto-professionalism (de Swaan 1988), characterised by an uncritical trust of the health professionals. . Third, the categories 'choice', 'voice' and 'co-production' may also provide a construct for comparative research. This paper will draw on the work of the EU COST ACTION IS0903 User Voice Working Group

## An Exploratory Study of Healthcare Professionals' Views of Diabetes Self-Management and Structured Education

Josephine K W Go Jefferies, Nottingham University Business School | [lixjg21@nottingham.ac.uk](mailto:lixjg21@nottingham.ac.uk)

Chronic disease care in the UK accounts for 70 per cent of NHS budgets with demand forecast

to increase (Coulter 2012). Health policy strategies aim to increase patients' ability to

self-manage (DH 2001) putting the onus of responsibility squarely on the shoulders of the unwell. Empowering patients will change their relationship with healthcare professionals (Anderson & Funnell 2005). By providing structured self-management education (SE) professionals are involved in managing that change. NICE (2003) requires that SE is offered to all newly diagnosed diabetics. SE is: taught by qualified healthcare professionals; evidence and theory based; written down; quality assured/audited; and delivered in a group setting (NICE 2003). Views of diabetes self-management were explored in a study of diabetes specialist Educators delivering the X-PERT Programme. The view of professionals as self-interested, engaged in professional projects to increase status and resources for

their members is confirmed by the study, although this self-regarding view is nuanced by a concern about quality of care provided to patients. Auditable benefits to patients from SE depend on whether patients' personal self-management goals align with parameters of disease-control goals prioritised by certain clinicians. Delivering X-PERT empowers Educators to a) improve their own diabetes knowledge, support and communication skills reinforcing expertise and effectiveness claims, and b) address poor quality diabetes care provided by more senior or distant colleagues, suggesting that SE can address poor professional practice by engaging patients as intermediaries, cutting across institutionalised specialisms which constrain their own professional effectiveness.

## Configuring the Patient through Complex Medication Schemes

**Attila Bruni**, University of Trento | [attila.bruni@unitn.it](mailto:attila.bruni@unitn.it)

**Claudio Coletta**, University of Trento | [claudio.coletta@unitn.it](mailto:claudio.coletta@unitn.it)

**Francesco Miele**, FBK - Fondazione Bruno Kessler, Trento | [francesco.miele1@gmail.com](mailto:francesco.miele1@gmail.com)

**Enrico M. Piras**, FBK - Fondazione Bruno Kessler, Trento | [piras@fbk.eu](mailto:piras@fbk.eu)

**Alberto Zanutto**, University of Trento | [alberto.zanutto@unitn.it](mailto:alberto.zanutto@unitn.it)

The increasing ageing rate of population and the development of ICT and Assistive technologies appear as relevant aspects in the re-organization of health care. This work provides an account of the visions and discourses around the theme of complex medication schemes for elderly people, emphasizing the ways in which they enact peculiar homecare infrastructures and networks and re-distribute medical knowledge and responsibility among experts and lay

actors. In fact, management of complex therapies represent an articulated social process where both patients, relatives, health care professionals and caregivers, as well as technological and medical device, are engaged. The paper is based on 8 focus groups with general practitioners of a north-italian province, conducted within the research project "AETAS - Active aging, Empowerment, Tecnologia, Salute".

## **b04RN19 - Change & Continuity in Social and Welfare Work**

Chair(s): Ellen Kuhlmann (University Campus Suffolk, UK - University Siegen, Germany)

### **Activation Strategies and the Sources of Discretion in Welfare Services**

Jorunn Theresia Jessen, Oslo University College | [Jorunn-Theresia.Jessen@hioa.no](mailto:Jorunn-Theresia.Jessen@hioa.no)

Since the middle of the 1990s the use of activation measures and conditional claims have increased in all parts of the Norwegian welfare administration as a result of more locally organized and tailored programs. One of the requirements for receiving benefits during unemployment and vocational rehabilitation is to meet the terms and conditions set by the local welfare administration. For the front line providers these changes entails not only extensive follow up of the needs of recipients, but also a wider range of activation measures and extended use of conditional claims and profiling tools (work capability assessment). Given these changes and activation strategies, what are the consequences for street level

discretion and professional practice? The main purpose of this paper is to explore how characteristics of the Norwegian activation policy play a significant role in exercising street level discretion. The empirical data come from a survey conducted among employees in local agencies of the Norwegian labor and welfare services in 2011. Results show that activation strategies in terms of conditional claims and follow up of claimants in need of long term measures, leaves broad opportunities for discretion among general practitioners, and challenge the role of professional knowledge in employment and welfare services.

### **Attac(k)! Social Work and Social Movements in Times of Crisis**

Wolfgang Walter, University of Applied Sciences Vorarlberg | [wolfgang.walter@fhv.at](mailto:wolfgang.walter@fhv.at)

In the beginning of modern Social Work and against the backdrop of the crisis of industrial capitalism, the first-wave feminist movement played crucial role in simultaneously providing a social basis for more traditional forms of care and reformulating these practices towards rational principles. In this process, Social Work became not only a scientifically based human-service profession but also an agent in Social Change. In the present and against the backdrop of the crisis of financial capitalism, there seems to be no relation between the different forms of the counter-globalisation movement and Social Work, now an important layer of developed welfare states. The paper deals with the question if and how current Social movements influence the development of Social Work. First, the

contribution of Women's, Workers', Youth and Peace movements to the new profession of Social Work is reconstructed and the interplay of demands to participation, academization, methodization and organizational establishment is analyzed. Second, the current constellation of new Social Movements and established Social Work under the "New Obscurity" (Habermas) is described. Third, the opportunities and obstacles for movement-driven reformulation of Social Work are reflected. Two contradictory scenarios are described: an alliance leading to a reflexive, globally and diversity oriented Social Work or the antagonistic relationship between a bureaucratized, conformist Social Work and progressive movements.

## Professionalism and Managerialism in Social Work: Some Empirical Evidence from the Turin Area

Arianna Radin, University of Torino | [arianna.radin@unito.it](mailto:arianna.radin@unito.it)

Willem Tousijn, University of Torino | [willem.tousijn@unito.it](mailto:willem.tousijn@unito.it)

Alice Scavarda, University of Torino | [alice.scavarda@unito.it](mailto:alice.scavarda@unito.it)

The professional nature of social work has been harshly debated both by social workers and by academic scholars. In Italy social workers (*assistenti sociali*) can be described as recently professionalized, while other occupational groups have appeared on the stage: educators, social-health operators and many others. All of them have been hit by recent managerial reforms of social work, including financial cuts and new managerial procedures. The paper produces some evidence from a qualitative study, based on

about 50 in-depth interviews to both front-line social workers and managers working in the Turin municipality social services. The addressed issues focus on professional autonomy, the occupational strategies adopted to cope with managerial innovations, and inter-professional tensions. The general hypothesis is that professionalism and managerialism should not be conceived as two conflicting logics: a new professional model is emerging, which includes important elements of the managerial logic.

## Recognition and Treatment of Problematic Substance Use: A Factorial Survey of Social Workers', Nurses' and Medical Doctors' Judgements

Lisa Wallander, Malmö University | [lisa.wallander@mah.se](mailto:lisa.wallander@mah.se)

Eva Samuelsson, Stockholm University | [eva.samuelsson@sorad.su.se](mailto:eva.samuelsson@sorad.su.se)

The “governing images” associated with the use and misuse of alcohol and drugs have varied across time and space. In Sweden, the 20th century saw a number of such perspectives – including the moral, the medical and the social – alternately dominating or coexisting. This multitude in perspectives is reflected in the organisation of addiction care and treatment, in which the responsibility for defining and finding solutions to addiction problems has of tradition been shared between the social services and the health care, and between the professions that are employed in the two organizations. Recently, a Government Official Report (2011:35) suggested that the responsibility for treatment should be fully transferred to the health care system – a proposal which is not only associated with professional jurisdiction, but which may also have consequences for potential clients in

terms of how their problems are defined and what help is offered. With the aim to systematically compare judgements about the recognition and treatment of problematic substance use between social workers (employed in the social services) and nurses and medical doctors (employed in the health care), this study will use data from a factorial survey which was conducted in 2012 among 328 staff at 50 social services units and 24 health care units in Sweden. In line with this quasi-experimental method, each respondent assessed ten vignettes, describing people with randomly varying social characteristics using alcohol, cannabis or cocaine. Multilevel regression analysis will be used in order to investigate similarities and differences in social workers' and nurses'/ doctors' judgements about the severity of use and the proper handling of the cases described.

## A Failing Profession? Why Permanent Chaos in Child Protection Has Become a Societal Problem

Ingo Bode, University of Kassel | [ibode@uni-kassel.de](mailto:ibode@uni-kassel.de)

Hannu Turba, University of Kassel | [h.turba@uni-kassel.de](mailto:h.turba@uni-kassel.de)

In modern society, child maltreatment is subject to institutional intervention. This intervention has long been seen as an affair of welfare professionals taking decisions after assessing individual cases, making knowledge-based diagnoses and interacting with families within case-specific trajectories. Nowadays, however, there is both critique and crisis in this area of professional work. In the context of tragedies reported by the public media, and with changing perceptions as to how welfare states should react, public regulation and organizational practices have changed considerably. Taking Germany as an example and drawing on results of case study research undertaken over three years, we argue that mainstream policy approaches in this field are mistaken in their understanding of child protection agencies and agents. Both the nature of the social problem the latter address

and the way welfare bureaucracies must cope with this nature inevitably provoke structural fuzziness, if not permanent chaos. Limitations in the treatment of child maltreatment become a societal problem not because of professional failure, but with the advent of a 'doctrine of perfectionism' proliferating with the radicalization of modernity in the Weberian sense, translating in over-formalization, all-inclusive accountability (NPM), and a new economics of welfare professionalism. Traceable cost-efficiency and objective total quality become the norm where limited knowledge, permanent uncertainty, and uncontrollable case trajectories are the rule. It is this normative environment which makes limited performance in the field problematic. Ironically, policies seeking 'perfection' create growing ambiguity, hence functional deficiency.

## a05RN19 - Health Professionals - Ethnographic Studies

Chair(s): Zoey Spendlove (University of Nottingham)

### Lost amidst Lean? A Critical Analysis of the Implications of Crisis-Driven Change for the Profession of Nursing

Sarah E Field-Richards, University of Nottingham | [ntxsef@nottingham.ac.uk](mailto:ntxsef@nottingham.ac.uk)

Stephen Timmons, University of Nottingham | [stephen.timmons@nottingham.ac.uk](mailto:stephen.timmons@nottingham.ac.uk)

Background: Lean Thinking (Lean) is a management philosophy originating from the Japanese automobile manufacturing company, Toyota. Lean has been applied widely within the NHS as a means to address the financial, quality and safety challenges that it faces. Implementation requires that traditional NHS culture and ways of working be challenged and

there is evidence to suggest that Lean is changing the way in which healthcare is physically and socially organised, managed, structured and delivered. Nurses are the largest professional group working in healthcare yet their experience, perceptions and response to lean-driven change, together with the implications, consequences and

significance for the profession, remain under explored, especially from a socio-cultural perspective. Aim: The aim of this Doctoral research is to explore the lived reality and meaning of Lean Thinking for Nursing and Nurses working at a University Hospitals NHS Trust. Methodology: This is a seven month ethnographic study, employing methods of observation and interview. Participants are nurses working on one of three wards at an NHS Trust. Contribution to knowledge: It is anticipated that research findings will contribute to sociological understanding of the

profession of nursing in the context of crisis, whilst providing critical commentary surrounding, and critique to affect, change. This research provides an opportunity to conceptually and empirically explore sociological themes of professional identity, collectivity and culture, boundary work and the division of labour, negotiations of professional power, role and status, meaning/sense-making and the changing nature of professional knowledge and work in contemporary healthcare.

## Being Effective: An Ethnography of Managers in the English NHS

Ellen Annandale, University of York | [ellen.annandale@york.ac.uk](mailto:ellen.annandale@york.ac.uk)

Olga Suhomlinova, University of Leicester | [os22@le.ac.uk](mailto:os22@le.ac.uk)

Nina Teasdale, University of Leicester | [nt91@le.ac.uk](mailto:nt91@le.ac.uk)

Effectiveness is a watchword within healthcare management. However, little research exists on what effectiveness means to managers themselves or how they seek to achieve it in their routine work. This paper explores these issues through in-depth interviews with a diverse sample of 91 clinical and non-clinical managers with varying spans of responsibility and scope of activity, working in two large English NHS hospitals (between 2010 and 2012). We found that the crucial 'hard', demonstrable measures of performance (such as service improvement and financial targets) are the visible front of a 'softer', diffuse and embodied conceptualisation where effectiveness is apparent in the 'smooth-running' and 'getting things done' associated

with communicative competence and 'unlocking the energy' of and enabling others. The analysis shows that in both its 'harder' and 'softer' dimensions achieving effectiveness is a 'wicked problem' that defies easy solution because it is embedded in the highly complex open system of the hospital as an organisation. 'Ripple-effects' and 'vicious circles' can occur whereby being effective in one area of work or part of the organisation can compromise effectiveness in another. This is exacerbated by poor communication or failures of communication and lack of feedback on managers' own work. We explore how managers deal with this and its impact on their everyday work.

## New Nurses: Who Do You Think You Are?

Bridget J Roe, University of Nottingham | [lixbr4@nottingham.ac.uk](mailto:lixbr4@nottingham.ac.uk)

This paper takes a dynamic approach to socialization, offering a nuanced understanding of how health professionals learn 'to be' in turbulent times. The increased technical and temporal requirements of nurses coupled with

service reconfiguration has led to crisis in the profession. 'Preceptorship' aims to transform the profession by moulding attitudes and behaviours and increasing the confidence and competencies of novice nurses. Through

blended learning and mentoring, organisations envisage enhanced productivity and innovation however the processes of this are little understood and programmes remain experimental. Combining sociological theories of professional socialization with contemporary theories of organisational learning as practice, professional 'becoming' is explored. Using the concept of 'socio-cultural positioning of the historical self', the study shows the ways that subjectivities are produced in socialization practices. Using observations, video and focus groups, this ethnography explains the mediation of knowledge in professional becoming through discourse, power relations,

and different cultural and material forms as practice. The study shows an understanding of how local and wider cultural positioning impacts onto nurses socialization (and emotions) and how this unfolds as practice in time and space. Translation and enactment of preceptorship policy often reinforced local customs rather than transcending wider knowledge boundary's. Professional 'becoming' was strongly mediated through organisational practices, artifacts and objects. New nurses were a source of critical feedback, creativity and innovation, however this was mediated by power. Under certain conditions, nurses were still able to transform.

## Reconciling Productivity and Professionalism - An Ethnography of the Emergency Department

Fiona H Moffatt, University of Nottingham | [ntxfm1@nottingham.ac.uk](mailto:ntxfm1@nottingham.ac.uk)

Stephen Timmons, University of Nottingham | [stephen.timmons@nottingham.ac.uk](mailto:stephen.timmons@nottingham.ac.uk)

In the UK the National Health Service (NHS) faces the challenge of securing £20bn in savings by 2014. Improving healthcare productivity is identified by the state as essential to this endeavour, and critical to the long-term future of the NHS. This paper aims to explore how contemporary UK policy discourse constructs rights and responsibilities of healthcare professionals in terms of productive healthcare, how this is made manifest in practice, and implications for professional autonomy/identity. Using the Foucauldian concept of governmentality as an analytical lens, it is proposed that policy discourse calls for a new flavour of professionalism, one that recognizes improving productivity as an individualized professional duty, not just for an elite cadre, but for all healthcare professionals. Using an ethnographic approach, data is presented from a large UK Emergency Department, exploring

the extent to which this notion of self-governance is evident. The study elucidates the ways in which: professional notions of productivity are constructed; productive work is enacted within the confines of an organizational setting; and tensions are negotiated. The findings of this study suggest that productivity is accepted as a 'new' professional duty, but one that engenders ethical reservations. Professionals describe productivity ideologically, based on the notion of practice as craftwork. However the lived reality of 'productive' work within the organization generates conflict which professionals negotiate via recourse to traditional occupational values. Understanding productivity from this perspective has implications for professional education, service improvement design and the academic field of the sociology of professions.

## **b05RN19 - Changing Professions - Newer Professions**

Chair(s): Christiane Schnell

### **The Management Consulting's Identity: At the Boundaries between Professions and Managers**

Lara Maestriperi, Polytechnic of Milan | [L.maestriperi@gmail.com](mailto:L.maestriperi@gmail.com)

In the recent years, there has been a transformation in the way the knowledge work is considered, above all when we focus our attention on the boundaries between the profession inside the organizations (i.e. management) and what is outside (i.e. freelance professionals). Usually considered irreconcilable, organizations and professionalism have started to build new forms, new strategies and new cultures in order to communicate with each other. Such progressive hybridization put in question the traditional assumption by which intellectual work within organisations is proletarianized or deprofessionalized, but on the contrary it favours the construction of a professional and organisational culture at the same time, which uses the organisation as a new space of

dialogue. The management consultancy is a privileged field in which observe such tendencies. Starting from a critic of the traditional approach to professions, in this paper I would like to propose an analysis based on organisational professionalism. In my opinion, this approach can offer the possibility to investigate the professional identities of management consultants, problematizing the issues of boundaries within and outside organisations. At the same time, because of the privileged relationships that they have with managers and other relevant cadres in the organisation, management consultancy can help scholars in highlighting the strategic use of management principle in professional activities, thus stressing the influence of neoliberal transformation on professionalism.

### **Professional News Journalism: Weathering the Storm of Crisis? Perspectives from an Irish Newsroom**

Mark P Cullinane, University College Cork | [mark.cullinane@umail.ucc.ie](mailto:mark.cullinane@umail.ucc.ie)

The journalism profession has borne the responsibility of chronicling the turmoil in capitalism (and its consequences) since 2008. Journalism's power to describe reality, diagnose problems and adjudicate on potential solutions plays a critical role in the social construction of crises. Yet, as crises mount in number and complexity- from the economic to the democratic, the social to the ecological (at local and global levels), and as various sources of authority and expertise have suffered losses of legitimacy, this paper engages directly with the question of whether those in the journalism profession believe that they are meeting the

challenge of making sense of the world today. Have the professional norms and practices of journalism, and indeed the news genres in which they operate, proved sufficient to describe today's complex- and disputed-realities? Drawing on the author's ethnographic fieldwork within the newsroom of the Irish public service broadcaster, which took place over twelve weeks in 2012 and encompassed thirty interviews with reporters, editors and management as well as daily attendance at editorial meetings, this paper argues that although covering the crises appears to continue to be challenging both

personally and professionally for many journalists, this has not resulted in a significant rupture or re-evaluation of professional precepts, practices, identity, expertise, and the nature of the journalistic claim to authority. Potential explanations for

this are explored, and include what many journalists see as the lack of ready alternatives to conventional journalistic norms, the pressure of doing more with fewer resources, and a paucity of opportunities for journalists to reflect on their practice.

## **Occupational Ethics in Banking and Finance – Morality, Critique and Change after the Financial Crisis?**

**Claudia Czingon**, Goethe-University, Frankfurt | [czingon@soz.uni-frankfurt.de](mailto:czingon@soz.uni-frankfurt.de)

The financial crisis which started in 2007-08 has turned into a massive economic and fiscal crisis, thus representing one of the most severe economic disorders of Western capitalist societies since decades. Yet, despite the crucial role that deregulated financial markets played in the outbreak of the crisis and the considerable public critique financial actors continue to face, political regulation of financial markets proceeds only slowly. Against this backdrop, my talk addresses the controversial question of finance's potential for self-regulation: To what extent is normative regulation exerted not only by external authorities, but also by the financial actors themselves? Drawing on Durkheim's theory of normative integration and the sociology of critique (Boltanski/Thévenot), I ask whether and to what extent a critical professionalism

has emerged in the financial sector following the financial crisis and whether a distinct "occupational ethic" that transcends economic rationality can be reconstructed among occupational groups in banking and finance. Based on semi-structured interviews with banking and finance professionals in Germany, my preliminary findings indicate that morality and critique take very different forms in the heterogeneous field of finance occupations. Further, the ability to take a critical stance and to transcend economic rationality depends on various factors such as personal experience, social belonging and education as well as the social context in which the latter takes place. By contrast, the financial crisis and public critique do not seem to have had as decisive an impact on normative orientations of the professionals as probably expected.

## **Geology, Geologists and Engineers: From Science to Professions**

**Luísa Veloso**, ISCTE-IUL, Lisbon | [luisa.veloso@iscte.pt](mailto:luisa.veloso@iscte.pt)

**João Freire**, IUL, Lisbon | [joao.freire@mail.telepac.pt](mailto:joao.freire@mail.telepac.pt)

**Noémia M. Lopes**, ISTCTE-IUL, Lisbon | [noemia.lopes@iscte.pt](mailto:noemia.lopes@iscte.pt)

**Luísa Oliveira**, IUL, Lisbon | [luisa.oliveira@iscte.pt](mailto:luisa.oliveira@iscte.pt)

**Raquel Rego**, ISEG, Lisbon | [raquel.rego@gmail.com](mailto:raquel.rego@gmail.com)

**Pedro Pacheco**, ISCTE-IUL, Lisbon | [pedro.nd.pacheco@gmail.com](mailto:pedro.nd.pacheco@gmail.com)

**Telmo Clamote**, ISCTE-IUL, Lisbon | [telmoclamote@net.sapo.pt](mailto:telmoclamote@net.sapo.pt)

Geology has for a long time been established as a scientific field. With the growth of economic activities concerning the exploration

but also, increasingly, the management of natural resources, where scientific knowledge is of even greater importance, geology started

branching out professionally beyond academia. That process translated itself in the creation of new settings in the labour market, where geologists, looking for employment opportunities, started working in teams with mining engineers and geological engineers, and also sought to professionalise themselves as geological engineers. It is discussing the relationship between science, labour market and economy that this paper proposes to present the dynamics and contradictions emerging within the professional field of geology, where, due also to economic and employment crisis, the disputes between professionals become more acute. The paper is supported by empirical data from a research that took place in 2011 on the professional field

of geology based on: document analysis of the educational offer at graduate and master levels; a survey administered to a sample of individuals graduated in geology, mining and/or geological engineering); and interviews to professionals, employers and heads of professional associations and of university courses. Through it, we aim at discussing: i) how the social process of professionalisation of geologists and its strategic reconfigurations of knowledge expertise to respond to a changing labour market, is questioning the traditional outlines of some professional frontiers; ii) and what impacts that may have on the professionals' skills and identities and, consequently, on the regulation of the field of geology itself.

## The Evolution of Management Consultancy between the Modern and the Postmodern

Shani Kuna, Sapir Academic College, Sderot | [scarlet@mscc.huji.ac.il](mailto:scarlet@mscc.huji.ac.il)

Management consultancy has been central in modern organizations for a century, since the early days of Taylorism. Reviewing the literature in attempt to understand the professionalism of management consultancy yields ambiguous findings. The great demand for management consultancy in the last two centuries is a stable phenomenon, as consultants are viewed as agents of knowledge vital in organizations facing change and even crisis. This practice, however, is often criticized for being a-theoretical and disconnected from academia. Management consultancy is practiced without typical characteristics of professionalism (e.g., expert knowledge), nor can professionalism explain the demand for it. Based on interviews with management consultants and clients, I offer an alternative explanation. Management consultancy has enjoyed the dual benefits of its evolution in the

intersection between the modern and the post-modern and it still thrives from the tension and the contradictions of this intersection. Management consultancy enjoys the presumption of being a profession, with the power, status and influence obtained from such image. Significant post-modern characteristics, which dismantle modern characteristics, have been absorbed in the practice. Hence, its subsequent development has been characterized by diversity, theoretical elusiveness and lack of professional boundaries. Interestingly, the percolation of social post-modern processes into organizations enhanced the legitimacy to treat managerial distress by unordinary means. Thus, organizations crave not necessarily for management consultancy marked by professionalism but for consultants who signify "otherness".

## a06RN19 - Innovation and Transformation - New Directions for Professionalism

Chair(s): Ruth McDonald (University of Nottingham)

### From Means to Ends: A New Professionalism

Willem Tousijn, University of Torino | [willem.tousijn@unito.it](mailto:willem.tousijn@unito.it)

Professionalism has been working for a long time as a “third logic” governing the division of labour, along with the market and bureaucracy. Recent changes in health care, social care, law, accountancy and other professional services industries have initially been interpreted as a zero-sum game in which professionalism is attacked and defeated by the two other logics. More recently both professional associations and academic scholars have been elaborating on a new

model of professionalism, which might come to terms with these changes. New professionalism often receives different adjectives (organizational, commercial, community, and others) that reflect partially different contents. These proposals are reviewed in the paper. The final suggestion is for a new professionalism more concerned in the ends of professional work than on its means.

### A “New Spirit” of Bureaucracy? The Projective World of European Public Affairs Professionalism

Sebastian M. Büttner, Friedrich-Alexander University, Erlangen-Nuremberg | [sebastian.buettner@soziol.phil.uni-erlangen.de](mailto:sebastian.buettner@soziol.phil.uni-erlangen.de)

Lucia Leopold, University of Bremen | [leopold@bigsss-bremen.de](mailto:leopold@bigsss-bremen.de)

Matthias Posvic, University of Bremen | [mposvic@bigsss.uni-bremen.de](mailto:mposvic@bigsss.uni-bremen.de)

The thesis of a major ideological shift from “hierarchy” to “networks” and “projects” between 1960s and 1990s, which was put forward by Luc Boltanski and Eve Chiapello in their book “The new spirit of capitalism”, is widely acknowledged these days. However, while respective sociological debates have focused on the business sector, the “projective world” of bureaucracies and related jobs is still unexplored so far. We argue that we can observe similar shifts in bureaucracies and state agencies, and we claim that such as business organizations, so too bureaucracies and state organizations have served as generators of project-based activities and as key drivers of the expansion of the ‘logic of projects’ in professional life. At the example of

EU policy-making we discuss the central role of project-based funding in EU public affairs, where most of the activities are outlined and announced in terms of project-based funding. Thus, recipients of EU funds are forced to adapt to this logic. This has led to the emergence and expansion of new types of professionals – European Public Affairs Professional – which is specialized on fundraising, co-ordinating, managing and/or evaluating EU projects. And it has also strongly contributed to the transformation of public policy and related fields of professional activities in accordance with the rules of the “projective world”. In our contribution we will discuss (a) the emergence and expansion of project-based funding in EU affairs; (b) major

features of the projective world of European Public Affair Professionals; and (c) the emergence of new study programs and

professional organizations which are dedicated to train the standards and practices project-based work in EU affairs.

## **Rapidly Growing Professions and Social Closure – Conditions, Consequences and Counter-Movements**

**Gunnar Olofsson**, Linnaeus University | [Gunnar.Olofsson@lnu.se](mailto:Gunnar.Olofsson@lnu.se)

**Ole Agevall**, Linnaeus University | [ola.agevall@lnu.se](mailto:ola.agevall@lnu.se)

Rapidly growing professions and social closure – conditions, consequences and counter-movements Ole Agevall, Forum for research on Professions, Linnaeus University, Sweden [Ola.agevall@lnu.se](mailto:Ola.agevall@lnu.se) Gunnar Olofsson, Forum for Research on Professions, Linnaeus University, Sweden [Gunnar.olofsson@lnu.se](mailto:Gunnar.olofsson@lnu.se) Students of the history of professions are likely to observe in their profession(s) of choice one or more major quantitative leaps when the number of practitioners set off in an exponential pattern. The growth of the welfare state after WWII, for instance, gave rise to such patterns both in the established professions and in the then burgeoning semi-professions. Growth rates with similar time-shapes occur in other historical contexts, driven by state

commitment, market expansion, or other forces. In this paper we explore the relation between professional expansion and social closure. We focus on those mechanisms which are concomitant with expansion and arise as a reaction within the jurisdictional fields of rapidly expanding professions. But expansion does not only strengthen the position of such professions – it also leads to changes in task structures, in aspirations for more highly valued tasks, and encourages new divisions of labour among occupational categories in the fields, including the new “kids on the block”. We will analyse the effects of professional “take-offs” after WW2 as a key example, although the main focus of the paper is theoretical.

## **Digital Technologies and the Changing Landscape of Professions and Occupational Groups**

**Suha Jaradat**, University of Reading | [s.a.w.jaradat@pgr.reading.ac.uk](mailto:s.a.w.jaradat@pgr.reading.ac.uk)

Professional boundaries between traditional professions and emerging occupational groups are continuously negotiated. While there is a well developed literature on these shifts, little attention has been paid to the role of digital technologies in developing a broader identity. This research draws on data collected from interviewing 50 practitioners in leading architectural practices in the UK and USA, using an emerging way to design, deliver and manage buildings known as Building Information Modelling (BIM). This approach is promoted by policy makers to address pressing challenges and seen by practitioners

to be more collaborative in which the design team take an integrated decision making process. This paper explores the nature of architectural autonomy, competence and membership and argues that this approach might compromise or influence the original design when more people are involved earlier. The participants were mostly qualified architects but others managed to find a route to architecture through these digital technologies. The role of BIM manager, which is occupied by architects, engineers and other specialists from diverse backgrounds, is an interesting example of how these digital

technologies open up architectural practice to emerging occupational groups. The data also show that BIM practitioners, form informal collaborative communities where they discuss problems and share information inside and outside their organizations. Moreover most

architects rely on their peer groups rather than professional institutions for guidance and help. These preliminary findings are reflected in connection with the existing literatures which discuss the opportunities, challenges and implications of new professionalism.

## State and Professionalization: Prospects of Sociological and Institutional Analysis

**Svetlana G. Kirdina** , Russian Academy of Sciences (RAS) | [kirdina@bk.ru](mailto:kirdina@bk.ru)

**Irina P. Popova**, Russian Academy of Sciences (RAS) | [irina\\_popova@list.ru](mailto:irina_popova@list.ru)

State influence on the professionalization assumes a new significance in modern European societies including Russia. Last two decades we have observed adapting the state to markets. But after the crisis a role of the state has been rethinking. It is also true for professions and occupational groups, which are becoming more and more a subject for social policy. The strategies of formation, development and transformation of professional/occupational groups in the context of crisis are in the centre of social debate. Within this new agenda, the paper focuses on the analysis of professional/occupational groups that are depended more than others on the support of the state for their prosperity. We consider

approaches to the definition of the methods of this support, principles and models of interaction of the state and professional/occupational groups in the processes of professionalization. A significant influence of historical and social context requires not only sociological but also institutional approach for the analysis as well as appropriate institutional concepts. An institutional matrices theory is applied in the paper to investigate interaction between a state and professional groups, with conditions and prospects of their interconnections. Empirical data about professional groups of the Russian budgetary sphere depending on the state support and policy is presented.

## b06RN19 - Challenge and Critique - Legal Professionals

Chair(s): Julia Evetts (University of Nottingham)

### Rethinking Feminine Capital in the Field of Attorneys

**Marta Choroszewicz**, University of Eastern Finland | [marta.choroszewicz@uef.fi](mailto:marta.choroszewicz@uef.fi)

This paper investigates the implications of gendered capital for women attorneys' careers in Finland and Poland. Applying Bourdieu's concept of capital, this work examines the efficiency of women's gendered currency in relation to the hierarchical structure of

professional prestige and power omnipresent within the field of attorneys. The work draws on the interview data with 25 Finnish and Polish women attorneys in order to expose how women benefit from their feminine dispositions in the struggle for legitimacy in the male-

dominated profession. I argue that women attorneys compete in the field of attorneys by bringing in different form of symbolic capital based on a set of attributes traditionally ascribed to women. Due to the exposure of the profession to the business rules based on the priority of lawyer-client relations, women have more flexibility to draw on their feminine capital. In this sense, the feminine features

which used to be the basis of women's exclusion from the legal practice, nowadays become revaluated for women's benefits in the field of attorneys. However, women's currency has differential efficiency depending on the expertise area. Thus, I suggest that women attorneys tend to make career choices in relation to that to what extent they can draw on their gendered capital.

## Challenges of Legal Professions Regarding the Democratization of Higher Education and the Reconfigurations of Labour Markets

Mónica Santos, University of Porto | [mosantos@letras.up.pt](mailto:mosantos@letras.up.pt)

The economic, social and political crisis in European countries has accelerated and reinforced the difficulties faced by young graduates in terms of access and integration into professional markets. The current paper, as a part of a Phd thesis, aims to contribute to the analysis of labour markets reconfigurations of Law graduates and to foster a broader theoretical discussion about the challenges handled by legal professions, particularly giving emphasis to the Portuguese context. Law graduation, known for the high prestige of its occupations, has been permeable to the increasing massification of higher education, reflected in the amount of law schools, vacancies, students and graduates. This growing supply of graduates has triggered a set of closure mechanisms undertaken by Law professional groups which, alongside with the recomposition of their

labour markets and occupational structure - such as economic markets globalization, expansion of salaried professionals and law firms, privatization of notaries and the spread of atypical and flexible forms of employment - have been shaping professional transitions and career patterns. The presentation will be supported by two sources of analysis: statistical data about the evolution of law graduates and content analysis of exploratory interviews to representatives of higher education and professional organizations in the Law field, such as lawyers, judges and notaries. We will discuss, in a critical way, their different perspectives about professional regulation towards the democratization of higher education, as well as how professional markets changes are shaping professional patterns in the current scenario of social and economic Portuguese crisis.

## Legal Profession in the Situation of Crisis of the Russian Judicial System

Elena Maslovskaya, Nizhni Novgorod State University | [ev\\_maslovskaya@mail.ru](mailto:ev_maslovskaya@mail.ru)

In the early 1990s the project of legal reform represented the desire of liberal jurists to introduce European legal principles and institutions in Russia. After 20 years of legal reforms the judicial system in Russia is regarded by many experts as existing in the situation of a deep crisis. In the 1990s this system was characterised by differentiation of

the forms of judicial practice, development of representative bodies and judicial self-government. This was accompanied by emergence of interest-groups and increasing professional stratification. The period of decentralization of state power was succeeded by a renewed trend towards centralization since 2001 and this was also reflected in the legal

sphere. The practice of instrumental use of the judicial system by the state authorities became more widespread. The aim of reforming the judicial system was its accountability albeit not before the society but rather before the state power. However, the limits of autonomy of the judges are defined within the judicial system itself. Chairs of the court possess very broad prerogatives. Judges who are formally autonomous remain specialized officials with corresponding values and dispositions. The

main indicators of the judges' activities have not changed since the Soviet times. These are still the number of acquittals and court decisions abolished by the higher courts. The paper analyses the values and professional orientations of several generations of judges, the peculiarities of this professional group in some regions of Russia, the institution of assistant judges as a form of professional socialization.

## Judicial Vision: Or, How to “Make Sense” of Defendants in a Lower Criminal Court

Irene van Oorschot, Erasmus University, Rotterdam | [vanoorschot@fsw.eur.nl](mailto:vanoorschot@fsw.eur.nl)

In Dutch criminal justice, judges are required to assess not just the particularities of the offense in deciding on verdicts, but also have to take into account the background and nature of the offender out of a concern with the “soul” of the deviant subject (Foucault 1977). As such, the defendant, his/her background and motivations, can be called an epistemic object, i.e. and object of epistemic attention which is as yet undefined, unstable, and unfolding (Knorr-Cetina 2001). As such, it also figures as a pragmatic problem in judges' every-day sentencing practices, who need to “make sense” of the defendant in order to “go on” (Garfinkel 1967). Drawing on ethnographic data gathered in a Dutch court, I aim to illustrate how exactly judges solve this epistemic as well as pragmatic problem; or, how they “make sense” of the defendant in order to decide on a

verdict. To arrive at the “truth of the defendant”, I will argue, judges navigate, select, and interpret various sources of information about the defendant, e.g. police reports, medical reports, parole service reports. In the Dutch inquisitorial system, they also take on an active role in “truth-seeking” practices in the court hearing, e.g. through the questioning of defendants and witnesses. In interpreting these sources of information, they exercise a form of “professional vision” (Goodwin 1994). This “judicial vision” allows them to “read” defendants, and process cases efficiently and justly. Foregrounding the relationship between work practice and cognition, this paper draws attention to the cognitive processes that are part and parcel of professionalism as lived and exercised by judicial professionals.

## 16JS19 - Poster Session

### How to Support Research and Planning in Human Resources for Health Crisis?

Edmond Girasek, Semmelweis University, Budapest | [girasek@emk.sote.hu](mailto:girasek@emk.sote.hu)

Eszter Kovacs, Semmelweis University, Budapest | [kovacs.eszter@emk.sote.hu](mailto:kovacs.eszter@emk.sote.hu)

Miklos Szocska, Semmelweis University, Budapest | [szocska@emk.sote.hu](mailto:szocska@emk.sote.hu)

Health policy literature and recent debates in Human resources for health (HRH) focus on several issues. Previous studies based on the HRH crisis have showed a widespread perspective. First, mobility and consequent inequality, that is, lack of certain health professional groups and specialties in different countries, then diverse understanding on definitions (e.g. nurse), methodology and difficulties in data collection procedures hinder solving HRH crisis. The aim of the present paper is to summarize the findings of different international health workforce and HRH monitoring research projects dealing particularly with terminology, methodology and health care statistics, furthermore, HRH data situation and mobility trends in Europe. The findings showed that common understanding and transparency is needed in definitions of different health professions of health

workforce (Eurostat/OECD/WHO/ISCO codes), and in the phenomenon of mobility. It is remarkable to differentiate registered, licensed professionals and active, practicing professionals in order to see the exact numbers in health workforce, so necessarily not only common terminology but common data collection methodology is needed. Harmonization of definitions is necessary in EU level that would support data collection, planning and health policy decision making. Available, reliable and valid data is accessible in several European countries; however there are countries that merely collect data in this field. Evidence based data, key indicators in HRH data is needed to get a comprehensive overview in health workforce and to detect mobility trends; moreover to support forecasting, namely, modeling, and establishing planning strategy in HRH.

### Demographical Crisis as an Opportunity for Groups Previously Excluded at the Job Market. People with Disability – Case Study

Magdalena H Pancewicz, HRK S.A. | [mpa@hrk.eu](mailto:mpa@hrk.eu)

The social fact of ageing society and decreasing number of potential employees (in productive age) at the job market is widely commented and discussed issue. However troubling for employer might that be, it seems to open new opportunities for groups previously on margin at the job market – the elderly or disabled. The presentation shall be based on the results of a research in best practices in hiring people with disability – case studies of 10 Polish and 10 European companies. The methodology included

interviews with different level employees (80), desk research and analysis of documents. According to the results the demographical change was revealed to be one of major reasons for opening companies for other previously underestimated groups of candidates. The response of companies to the crisis at the job market is much interesting. In order to reach an economic advantage, companies develop socially responsible and sustainable policies. Not only a great organizational culture's change is needed to

support the process but also an encouragement from the state. The study shows how companies, the third sector and government might successfully cooperate in order to create opportunities for the impaired. Various ways of employing people with disabilities were adapted by different companies, dependent not only on the profile of the company, but also the group they are

focusing at – people with inner diseases, physical or mental disabilities. Different organizational and infrastructural changes were needed as different was the challenges and problems faced. The research revealed a much positive impact of diversity policy on employee's attitude, organizational culture, and business as well.

## **The Governance of Home Care in Italy: A Model for the Reform of the Whole Italian NHS?**

**Marina Izzo**, International Fund for Agricultural Development (IFAD), Rome | [izzomar@libero.it](mailto:izzomar@libero.it)

The aim of this paper is to explore whether the paradigms underlying the governance of home care in Italy can be successfully applied as drivers in the development of the upcoming reform of the Italian NHS. This reform has been recently announced by former Prime Minister Mr Mario Monti, and currently represents quite a thorny problem for Italian policy makers. The research draws on documentary analysis using sources such as health and social research studies, government reports, research articles, bills and laws as well as on interviews with health experts, researchers, and civil servants working for the social and health care departments. The study demonstrates that the application of the home care governance model to the whole Italian NHS can bring about

an effective reform of the latter both in terms of financial sustainability and of safeguard of the universal access to health services by citizens. This is due to the underlying ideological framework of home care governance in Italy, which partially rejects some of the assumptions of the biomedical paradigm deemed by recent studies a major obstacle in the implementation of the latest reform of Italian health care sector. The home care governance model offers an alternative approach that acknowledges the need for participation and network-based methods in the organization of services and provides interprofessionality in care delivery. This line of action seems to be more appropriate in meeting the health demands of Italian post-modern society.

## **The Effect of Institutional Arrangements on Career Decisions in Nursing**

**Ines Trede**, Swiss Federal Institute for Vocational Education and Training SFIVET | [ines.trede@ehb-schweiz.ch](mailto:ines.trede@ehb-schweiz.ch)

**Irene Kriesi**, Swiss Federal Institute for Vocational Education and Training SFIVET | [irene.kriesi@ehb-schweiz.ch](mailto:irene.kriesi@ehb-schweiz.ch)

Switzerland is facing a serious shortage of healthcare professionals. This shortage – and in particular the shortage of nurses with tertiary-level qualifications – is a threat to patient safety and high quality care. In order to

counteract this emerging “care crisis” and to increase the supply of nurses trained at the tertiary level, the training system for healthcare professions was revised in Switzerland in 2002. At the upper-secondary

level (ISCED 3) a new nation-wide training course was introduced. At the tertiary level, the German and the French speaking parts of Switzerland responded with two different strategies. The former located the tertiary nursing education mainly at the non-academic level (ISCED 5B), the latter at the academic tertiary level with higher entry requirements (ISCED 5A). Against this background, our paper explores whether these institutional differences affect the choice of entering tertiary-level education in nursing. In particular, we will analyse the role of the institutional setting at the tertiary level in explaining the transition probability of young

people with a secondary-level nursing degree into tertiary-level nursing education. The analyses are based on a full sample of third-year nursing students of 2011 (N=2089). The data was collected at the end of the students' upper-secondary training and one year after its completion. Educational choices were analyzed using multinomial logistic regressions. Preliminary results show that the transition probability into tertiary nursing education does differ between the two institutional settings. It is also affected by social origin, educational attainment and characteristics of the training firm.

## Transformation of Surgical Profession in Turkey: The Effects of the Transformation in Healthcare System

Gulsah Baskavak, Middle East Technical University, Ankara | [cgulsah@gmail.com](mailto:cgulsah@gmail.com)

Turkey is undergoing a transformation of the healthcare system in ways both similar to and different from the changes in European countries. Surgery and surgeons occupy a central place in the debates regarding the pros and cons of the transformation policy followed in the last decade. Sometimes, surgeons working in public or university hospitals are treated as 'scapegoats' by the proponents of privatization, claimed to receive money from patients, privileging some patients over others, and so on. For the opponents of 'commercialization' and 'marketization', the negative effects could be the increase in unnecessary surgical operations, or the loss of professional autonomy with negative consequences for health as a 'public good'.

Surgery is also crucial with regard to the increasing investment in medical technologies. In this context, this study aims to explore how these changes are experienced by the surgeons. It is based on in-depth interviews with surgeons in various branches in Istanbul, Turkey, which were conducted as part of a larger PhD research. The interviewees are surgeons working in public and private institutions. In terms of professional skill and reputation, most of them are among the most qualified surgeons in the whole country. The paper aims to propose a typology of surgeons according to their responses to the transformation in healthcare system in Turkey, which has direct effects on their work.

## Health Care from the Perspective of the Medical Practitioners

Tetyana V. Ivanova, Sumy State University | [sociol\\_tanya@mail.ru](mailto:sociol_tanya@mail.ru)

The aim of the study is inquiry into the doctors' opinions about health care in Ukraine, as well as the factors that affect the attitude of patients to treatment. The inquiry scope includes seventy six interviewed physicians of

various specialties (primary care physicians, gynecologists, endocrinologists, neurologists, pediatricians, cardiologists, urologists) who are employed in the field of public medicine. The respondents consider the main health

issues to be economy-related: low wages (85 %), obsolete equipment (82%) and high cost of medication (62 %). The lack of professional skills were not classified as an issue - 5 % of the respondents pointed to low qualifications of doctors, and 8 %, to careless attitude of the hospital personnel to patients. According to the respondents, the main reasons for the patients to delay seeking medical treatment are the lack of money to pay for the treatment (83 %), the lack of a culture of caring about one's health (58 %), and commitment to self-treatment (53 %). The respondents also evaluated the effect of various factors on the patient's attitude toward the healing process. A

rational attitude towards the disease is characteristic of middle-aged people with higher education. An irresponsible attitude to their health is more typical for young men with low education level and low incomes. Thus, the main health issues in Ukraine, according to the respondents, are related, to a greater extent, to non-medical plan factors, or rather, to the lack of funding of the medicine. The factors that influence the occurrence of diseases include the lack of public concern about their health, which is manifested, (1) in an unhealthy life style, and, (2) in commitment to self-medication.

## Crises of Ideology of Altruism of Medical Practitioners in Changing Russia

**Anna Valeryevna Semenova**, Institute of Sociology (RAS) | [mansurov@isras.ru](mailto:mansurov@isras.ru)

**Olesya V. Yurchenko**, Department of Sociology of Professions and Professional Groups, Institute of Sociology (RAS) | [olesya@mail.ru](mailto:olesya@mail.ru)

Professional altruism taken as a social good has been seen as an important characteristic of professionals in different countries. We have monitored the issue of professional ideology of medical practitioners since the beginning of health care reforms in Russia. Since then, the process of partial privatisation of medicine has taken place and the healthcare costs have risen. Russian medical practitioners wish to be seen as having a greater commitment to 'doing good work' than to economic gain, and to quality rather than efficiency. However, a proclaimed ideology should not be mistaken for reality. Some of medical practitioners' actions may be considered to be a dedicated service for 'the public good', whereas others may be seen as self-enhancement. Recently, almost half of the respondents in All-Russian research said that the level of professional

expertise of Russian doctors was not satisfactory. Even more respondents were discontented with the lack of altruistic attitude on the part of doctors. The idea of altruistic professional service in the period of financial crises in Russia may be called into question, although there are important differences between various segments of the medical profession. Hospital doctors and the medical practitioners that work with the patients in serious and critical conditions still tend to support the socialist-oriented priorities of the free access to medicine and patients' equity. Their work motivation often does not depend on income. Other segments of medical profession tend to see their work as a contract based on market incentives rather than a mission.

## Conflicts between Physicians and Patients Regarding Resuscitation

Elizabeth W Dzeng, University of Cambridge | [edzeng@gmail.com](mailto:edzeng@gmail.com)

In the United Kingdom, recent controversies surrounding end of life care, such as with the Liverpool Care Pathway, highlight increasing demands for autonomy in health care decisions and a growing lack of trust in the medical profession. Drawing from the works of Eliot Friedson, John McKinlay, and Marie Haug, I explore how deprofessionalization and consumerization have compromised the physician's ability to maintain power in individual patient interactions. Loss of physician authority shifts decision-making power towards patients at the expense of physician control over clinical decisions. These factors may contribute to problem of overtreatment, of which overly aggressive treatment at the end of life is exemplar. Using the example of the Do Not Resuscitate (DNR)

order, I discuss how decisions made between physicians and patients, reflect changing power dynamics and threaten the physician's ability to act in the best interest of their patient. I will make comparisons between the UK and the United States, where this professional social transformation arguably occurred decades ago. An increasing prioritization of choice and patient autonomy over clinical judgment, has contributed to spiraling health care costs in America and threaten to do so in the UK. Furthermore, prioritizing unrestricted choice in medical care at the expense of clinical judgment, forces physicians to perform futile therapies that they may believe are harmful to the patient and ethically unacceptable.

## The Confidence Crisis – Crisis of Professions? Implications of Cancer

Antonina Doroszevska, Warsaw University | [a.doroszevska@gmail.com](mailto:a.doroszevska@gmail.com)

Małgorzata Synowiec-Piłat, Wrocław Medical University | [m.synowiecpilat@gmail.com](mailto:m.synowiecpilat@gmail.com)

Cancer diseases pose a serious medical and social problem. In order to reduce their consequences, it is important to increase the quality of the medical services, decrease cancer fatalism, and create systems of social support. The doctor-patient relationship deserves special attention. The patient's confidence in physicians matters greatly in shaping preventive behaviours and compliance with doctor's recommendations. Confidence is also one of the most crucial values in sociological and ethical analysis of medical professions and the doctor-patient relationship. The physician profession has high prestige in the Polish society. Is such high prestige it connected with confidence in the medical profession? A questionnaire conducted in 2012 based on a sample of 910 adult Poles showed that only 57% of the respondents had

confidence in physicians. The factors that influence the confidence levels include occupation, level of income, education and knowledge about significance of the preventive screening. To analyse the problem of low confidence in physicians, we will refer to sociological theories, e.g. the Weberian and Neo-Weberian definition of closure. Also useful could be the theories of the doctor-patient relationship and models of the patient role. Patients are encouraged to be active actors. However, this may lead to questioning the physicians' authority when the patients quote non-specialist sources. A higher level of confidence in physicians could help increase the number of people participate in preventive screening, or consult doctors soon after the first symptoms are observed. These factors influence cancer detectability rates in the

initial phase. They increase chances of effective treatment and reduce costs.

## **Retrenching Health Care through Targeted Preventive Work – A Study of Danish Home Nurses' Response to the Health Care Crisis**

Marie Ø Møller, Aarhus University | [Marie@ps.au.dk](mailto:Marie@ps.au.dk)

It is widely recognized that health care is in a state of crisis. Increased public spending and a decline in support towards poor-resourced people dominate as standard explanations. In Denmark, a welfare state with universal health care, the crisis has led to an adjustment of the universal health care access. The political response has been to target health services to 'those in need of special care' through a more intense focus on prevention. The idea is to prevent illness instead of curing it. In this paper I study the impact of these new rules on the institution of home-nurse care. A study shows that home nurses think differently about whom to prevent from what, when and why. The degree of social distance home nurses face with families as well as their professional

norms explain part of the variation in worries towards children and families, but the impact of collective orientation on how they justify the need of health prevention remain unclear. In this paper I use qualitative vignette-method to study home nurses' preventive work with families and small children in four Danish School districts. I argue that the preventive rules encourage home nurses to draw on personal identification with families to justify preventive work, but that this is mediated by their collective orientation and experience with different social contexts. I mainly draw on sociological theories on collective orientation and moral boundary drawing to study how home nurses different justifications of worries play out in my material.

## **Do Citizen's Negative Freedom, Education and Welfare State Type Contribute to our Understanding of the Differences in Subjective Well-Being?**

Rania F. Valeeva, Ghent University | [valeevarania@hotmail.com](mailto:valeevarania@hotmail.com)

Piet F. Bracke, Ghent University | [piet.bracke@ugent.be](mailto:piet.bracke@ugent.be)

Democratic societies are well-ordered societies according to which each person has equal opportunities to maintain a good life. Consequently, good life is known to reflect person's well-being. However, empirical studies show the differences in subjective well-being across the general populations of western societies. Rawls (1971) suggests that barriers of different kinds could constrain the maintenance of a good life. Based on Rawls' approach of good life, we tried to understand the differences in people's subjective well-being. We elaborated his approach by proposing that personal education, negative freedom in terms of non-domination, and welfare state type of countries in which people

live influence people's subjective well-being. We estimated this, using data from the European Social Survey performed in 2006-2007, in a sample of 38151 inhabitants of 23 European countries aged 20 up to 80 years. To test the hypotheses, we used multi-level modelling. We found cross-national educational differences in subjective well-being which is represented by happiness and life satisfaction. Moreover, the results reveal relationships between several measures of personal liberties (negative freedom) and subjective well-being, as well as relationships between personal education and liberties. Finally, the findings show that welfare state type of a country matters for the people's

subjective well-being, and also moderates educational differences in their perception of well-being. Our results suggest the value of learning more about how state-citizenship can

be built in order to maintain a good life. References: Rawls J. (1971) A theory of justice. Harvard University Press, Cambridge, Mass.

## Professional Health Sociologists in the Crisis of the Italian Health System: Conflicts and Alliances in Mental Health and Addiction Diseases. A Framework for a Pilot Study

**Pietro Paolo Guzzo**, Provincial Health Authority of Cosenza | [paolo\\_guzzo@libero.it](mailto:paolo_guzzo@libero.it)

**Paolo Ugolini**, Azienda USL Cesena | [pugolini@ausl-cesena.emr.it](mailto:pugolini@ausl-cesena.emr.it)

Since 1978 the sociologists of the Italian Health Service have traveled roads impassable, making experiences still useful today in times of crisis. Divided into two parts, the paper discusses the role of citizenship and intermediation of sociologists of health in the NHS, with particular reference to those in the field of drug addiction. Basis of an analysis of the different "careers" (including border) of sociologists in the NHS, the first part outlines a theoretical framework on the multiple roles of the sociologist in the dependencies (agent of network alliances with citizens, evaluator, catalyst of interprofessional knowledge of

SSN). The second part applies this scheme to a pilot study conducted with qualitative interviews (n = 10) between sociologists professionals employed in Emilia Romagna and Calabria. The revision would lay the groundwork for a broader research aimed to photograph not only the current replacement professional sociologist in the NHS, but also the impact of its action. In general on the transformation of health and social welfare in progress and, more specifically, in the services and departments of Mental Health and Addictions disease.

## Social Role of Pharmacist in Changing Society

**Anita - Majchrowska**, Medical University of Lublin | [anita.maj@wp.pl](mailto:anita.maj@wp.pl)

**Introduction** The social role of pharmacist have not been subject to systematic sociological analysis on the ground of polish sociology. The fact of changing position of pharmacist among the other medical professions, increasing its participation in the process of therapy, and the privatization of pharmacies result in transformation pharmacist into entrepreneur, who is an active participant in the socio - economical process. All these make that members of that profession become an important subject of socio - medical research. Social reforms, proprietary changes of pharmacies and change of social expectation causes that pharmacist is not only the medication' seller but also has to carry out the

role of entrepreneur and health consultant. **The aim** The aim of the research was analysis of pharmacists' identity and their role in perspective of them. **Methods** Research material consists of results of survey research carried out among 186 pharmacists working in south-eastern Poland. **Results** Polish pharmacists are attached to classic conception of their role - medicines' selling or informing about health products. Few of them run pharmaceutical care (about 10 %) and only 1/3 of all of them consider introduce such care in the future. Pharmacists see many barriers in implementation of pharmaceutical care (lack of financial support, big responsibility, not enough knowledge standards). They also do not

perceive their role as entrepreneurs (2%). Conclusions Polish pharmaceutical society struggle with problem of defying their own identity. The role of pharmacists is not limited

to selling medicine but they are afraid of new duties which follow from broadening of their social role.

## How to Motivate Nurses in the Financial Crisis of the Health Care System?

Jiří Vévoda, Palacký University, Olomouc | [jiri.vevoda@upol.cz](mailto:jiri.vevoda@upol.cz)

Lubica Juríčková, Palacký University, Olomouc | [lubica.jurickova@upol.cz](mailto:lubica.jurickova@upol.cz)

Kateřina Ivanová, Palacký University, Olomouc | [katerina.ivanova@upol.cz](mailto:katerina.ivanova@upol.cz)

Šárka Ježorská, Palacký University, Olomouc | [sarka.jezorska@upol.cz](mailto:sarka.jezorska@upol.cz)

Expenditures on health care show a long-term worldwide increasing trend. The current economic situation is forcing fund providers, especially health insurance companies, to re-examine their quantity or often even to freeze them, which also may have an impact on personnel and payroll area. Wage freezing and demanding nature of nurses' work, that conceals many precautionary and health risks could bring increased nurse fluctuation. Therefore, according to the European Union it is necessary to create effective employment strategies in the area of public health. The employers' interest is to retain professional nurses and to increase their work saturation, to focus on motivating working environment factors that do not demand increase in financial costs. Herzberg's motivation-hygiene

theory clearly explains what motivates people to work. For these reasons, in 2011, according to this theory, a representative survey involving 1992 nurses working in hospitals in the Czech Republic was realized. When processing the results, Mann-Whitney and Kruskal-Wallis tests, but also non-traditional Euclidean distance or decision trees datamining technique were used. The research has confirmed that the traditional nature and content of the nurses' work (i. e. the work itself) and the associated prestige of this profession are for nurses even currently still motivational. If the nurse feels saturated in her professional role, this means that the employer himself/herself emphasizes the quality of provided health care, majority of nurses do not tend to fluctuate.

## RN19 - Poster Session

### Future Sociologists for Future Crisis? The Case of Croatian Sociology

Valerija Barada, University of Zadar | [vbarada@unizd.hr](mailto:vbarada@unizd.hr)

Željka Zdravković, University of Zadar | [zzdravko1@gmail.com](mailto:zzdravko1@gmail.com)

This paper seeks to explore the potential of sociology as a profession to understand the post-transitional socio-economic changes in Croatian society. It is argued that the Croatian sociology profession is characterized by

interrelation of its legitimizing and interpretative role (Bauman, 1987). This tension is specifically incorporated in the process of professional socialization during university education of future sociologists. The

argument is based on qualitative and quantitative research conducted in 2012 on BA and MA sociology students in Zadar, Croatia. Interview results show that students see sociologists as well informed, tolerant, critical, publicly outspoken professionals capable of explaining complex processes and thus actively influencing social change. The sociologists in the making, note that they have undergone emancipatory process which only overflows to their personal groups. The survey data corroborate these findings. While some segments of students still exhibit survival values (Inglehart, 2005), the results show the rising tendency in self-expressive values and

attitudes. However, self-expression fails to activate critical public engagement of students and to enculture them into the interpretative sociology professionals. They remain within their closed and familiar networks and settings, and do not foster competences for the proactive response to the changing socio-economic frameworks. The developmental potential of future sociologists thus remains ambivalent: they perceive the profession as interpretative, emphasizing its public role (Burawoy, 2005), while the lack of their own engagement can be understood more from the legislative realm.

## Multiple Comparison in Sociology of Profession

Mikhail Basimov, Kurgan State University | [basimov@mail.ru](mailto:basimov@mail.ru)

In the report is represented an application of the author's method "Multiple comparison" at the joint analysis of data (nominal and interval) within the limits of sociological research (I. Britvina's data) on studying the process of employment of the young specialist at a labour market. In the research were studied three parts of the process of employment interacting at the moment of an appearance of the young specialist at a labour market, as its agent and as carrier of those professional qualities which he/she has received during study process. They are the young specialist him/herself, a professional institution where he/she studied and received a particular set of knowledge, skills, and the particular employer who is the materialised representative of "labour market". 14 variants of answers to a question "What are the basic motives to enter this educational institution?" became ratings

(nominal variables) for our task of multiple comparison. Also have been chosen 45 interval scales, characterizing through the answer: the role of the educational institution in the training the specialist, features gained by the graduate at the period of the studying, characteristics of the educational institution and occupation. There were estimated the expectations before entering the University, real results and personal importance of the characteristic. In the report is given a substantiation of the method and the structure of representation of results of the analysis of the data is considered. The mechanism of work of two variants of a method of the multiple comparison, based on pair comparisons and the revealed authentic differences (between groups for all parameters, between parameters for all groups) is considered.

## Professional Occupation as a Condition of Social Stability

Marina G. Khokhlova, IMEMO | [marina\\_khokhlova@mail.ru](mailto:marina_khokhlova@mail.ru)

Social and economic instability deactivates a part of the employed (in terms of profession and qualifications), which had been forming for

a long period of time under the influence of economic factors. The active part of population mainly adapts by obtaining professional

employment: for example, in 1990s in Russia it was primarily through changing professional occupation (M.Khokhlova 2005). The heat of social dissatisfaction usually decreases when a person becomes professionally occupied, which is the primary component of one's status and role in the social division of labour, and thanks to salary a better quality of life. Private initiative, mobilizing personal efforts is often followed by rejection of social benefits and state guaranties. The latter frequently becomes a person's free choice. One of the examples of the shifting model is the growth of informal employment. Studies focused on

Russia (M.Khokhlova, 2007,2008,2009) show that this phenomenon is expanding and involves people of top qualification, those engaged in high-demand professions (both during the crisis and in the stabilization periods). The creation of a global information space has both positive components (the opportunity to work remotely, to exchange information, to 'create' the quality of life) and destructive ones (it provokes rejecting the traditional way of life, which, due to little preparedness for critical assessment of events, results in a growing role of agents suggesting controversial alternatives).

## Collecting Information on Job Tasks – A Survey-Instrument to Measure Tasks Required at the Workplace in a Multi-Topic Survey

**Bernhard Christoph**, Institute for Employment Research (IAB), Nuremberg | [bernhard.christoph@iab.de](mailto:bernhard.christoph@iab.de)

**Britta Matthes**, Institute for Employment Research (IAB), Nuremberg | [britta.matthes@iab.de](mailto:britta.matthes@iab.de)

**Florian Janik**, Institute for Employment Research (IAB), Nuremberg | [florian.janik@iab.de](mailto:florian.janik@iab.de)

**Michael Ruland**, Social Science Research Center Berlin (WZB) | [michael.ruland@wzb.eu](mailto:michael.ruland@wzb.eu)

Knowledge about job tasks can be an important tool for analysing professions as well as occupations in general and possible changes regarding their job content that might take place over time. However, we found that up until now there seems to be a lack of survey instruments which at the same time are detailed enough to provide information on particular job's task profiles while being sufficiently compact for being administered in a multi-topic survey. Therefore, we decided to develop a new instrument, which currently is administered for the first time in the third wave of the German National Educational Panel Study's (NEPS) adult stage. Setting out from the works of Autor, Levy and Murnane (2003), we identified four task domains to be covered by the instrument. These are: Cognitive Requirements (Analytic); Physical

Requirements (Manual); Interaction (Interactive); Routine (Routine Tasks). These four domains were supplemented by a fifth, which is job autonomy. Starting point for instrument-development was an intensive review of existing instruments like BiBB/IAB, BIBB/BAuA, the British Skills Study and the Survey of Workplace Skills, Technology, and Management Practices (STAMP). For a large part we chose the latter as a basis for our developments. After discussing these background issues in detail, our presentation will provide a short overview of the steps taken during development of the instrument. Finally we will present first exploratory analyses of the task-data collected in the third NEPS-wave, and task profiles for selected occupations to validate the instrument.

## RN20 - Qualitative Methods

### a01RN20 - Phenomenological Research: Exploring the Subjective Perspective

Chair(s): Thomas Eberle (University St. Gall, Switzerland)

#### 'Inner Speech' in the Phenomenological Research Perspective

Irena Szlachcic, University of Wrocław | [i.szlachcicowa@gmail.com](mailto:i.szlachcicowa@gmail.com)

In my paper I argue that the internal conversation is a specific medium between the self and the action and determines the ability to perform actions with a subjective character. If we acknowledge that the personal reflection has an independent ontological status, it raises the question about the possibility of studying it. How can an internal, personal reflexivity be identified and described? To what extent does the description of internal experience reflect the experience it describes? Understanding and interpretation of the reflective inner life is based on linguistic descriptions of those experiences. This, what is internally experienced and felt, can be recreated - if at all - only post factum, and by reference to the particular situation. To reach the reality, which is the inner experience's part, to attempt to capture the specificity and importance of it, is only possible through its description. Therefore

the researcher faces the task of reconstructing the system of meanings and symbolic references, which acts as a specific interpretative key used by the respondents. Interpretive analysis, which on the basis of this action is done by the researcher, is meant to build an appropriate conceptual framework that allows the test phenomena to be categorized and explained. In the context of undertaken research and interpretative activities, we should ask the question about the relationship between the everyday language, in which respondents present their practice of everyday life, and theoretical language introduced by the sociologist to the analysis. Is it possible to achieve an adequate translation between interpretive schemes used by the subjects and the patterns constructed by sociologists?

#### The Storied Life: The Role of Storytelling in the Construction of Individual and Collective Identity

Conrad Kotze, University of the Free State, Bloemfontein | [pckotze@yahoo.com](mailto:pckotze@yahoo.com)

Jan K Coetzee, University of the Free State, Bloemfontein | [coetzeejk@ufs.ac.za](mailto:coetzeejk@ufs.ac.za)

Florian Elliker, University of the Free State, Bloemfontein | [ellikerf@ufs.ac.za](mailto:ellikerf@ufs.ac.za)

Based on a 2012 study of white Afrikaans speaking South Africans, this paper explores the role of storytelling in the construction of individual and collective identity. This study

showed the impact of elements of storytelling, including the plots, genres and character types constituting stories, their sources and circulation, and the normative effects of shared

stories on the construction of individual and collective identity, on the construction and dispersion of intersubjective meaning among socially related individuals. Every person has access to a biographically informed narrative repertoire, which consists of the various stories available to that person's construction of identity at a specific point in time. This repertoire consists of both actual and collectively prescribed ideal perceptions of the life-world and exercises an under-appreciated influence on the social construction of reality and the consequent internalisation of this reality into identity, both individually and collectively. These insights are explored through examples that highlight the process of

collective identity formation among white Afrikaans speakers, whose collective representations were delegitimised after the end of Apartheid in 1994. Drawing from shared stories, white Afrikaans speakers have constructed at least three salient and differentiated types of collective self-understanding, distinguished by the structure and content of the stories told between their members. These provide individuals with the symbolic resources to connect to those that share the same stories. This paper explores the processes through which these collectively storied identity prescriptions are assimilated and contested by individuals.

## The Relevance of Playful Elements in Hermeneutic Methods

Regine Herbrik, Technical University of Berlin | [regine.herbrik@tu-berlin.de](mailto:regine.herbrik@tu-berlin.de)

The aim of this paper is to show why it makes sense to underline playful elements in hermeneutic methods. This does not mean that a newly invented method is presented. Rather, the playful elements that are already part of some qualitative methods (f. i. the Hermeneutic Sociology of Knowledge), that are heavily used in sociology, will be elaborated on. It is possible that just these elements are responsible for the high level of insight that can be gained in the usage of these methods. However, the humanities have reservations when it comes to discussing a conjunction with elements that are originally taken from the realm of game and play. This is due to the fact that scientific methods have to present themselves as valid, reliable and 'objective' (better: intersubjective) tools, whose application produces secured, substantiated knowledge. Whilst the importance and

meaningfulness of child's play for the increase of knowledge are generally accepted in didactic and educational discourses, these potentials are rather ignored or even discounted when it comes to methodology. Nevertheless, both, playing and hermeneutic interpreting, can be seen as a means for establishing a methodical distance to the world of everyday life. With the aid of this distance new perspectives can come into view. Playing games and interpreting data means to switch back and forth between different 'life worlds' (Schütz). Therefore, both tasks have to deal with the requirement to withstand ambivalences. These emerge while actors keep the current 'frame' (Goffman), play or interpretation in mind, and parenthesize it at the same time in order to take the life worlds of play or interpretation seriously. This takes place in both cases within an imagined

## b01RN20 - Ethnography I

### Qualitative Methods in Economic Sociology. Perspectives and Challenges.

Lukas T Marciniak, Lodz University | [l.t.marciniak@gmail.com](mailto:l.t.marciniak@gmail.com)

Reflection on markets, financial transactions and economic processes is nowadays influenced mostly by quantitative, global-scale surveys and reports. The mainstream analysis uses statistics and transaction factors to get the big picture of the socio-economic situation and forecast trends. However, the focus on mathematical analysis and macro-level processes seems to be not sufficient in terms of the forecast reliability. Current socio-economic analysis studies financial operations, market prices levels, and economic policy and forgets or even reduces humans as acting parts of these processes. The crisis drove development of studies based on quantitative methods that are not adequate to analyze

“embeddedness” of economic processes in human actions. These methods enables to see result of human actions and interaction but not their trajectory, their meaning and their reciprocal relation that brings purely economic effects. To understand economic actions we should develop methods of actions analysis, considering when and how qualitative methods should be applied in studying markets, financial transactions and in forecasting economic trends. Drawing on social pragmatism, research experiences and results of the secondary comparative analysis of ethnographic materials I will show how new approaches and directions for qualitative economic sociology markets emerged.

### Analysis Through Discussion: Collaborative Interpretations from Ethnographic Data in Multiple Settings

Sirpa Lappalainen, University of Helsinki | [sirpa.lappalainen@helsinki.fi](mailto:sirpa.lappalainen@helsinki.fi)

Elina Lahelma, University of Helsinki | [elina.lahelma@helsinki.fi](mailto:elina.lahelma@helsinki.fi)

Reetta Mietola, University of Helsinki | [reetta.mietola@helsinki.fi](mailto:reetta.mietola@helsinki.fi)

In this paper, we discuss the possibilities for collaborative and cross cultural analysis that draws from several ethnographic studies conducted in multiple educational settings, multiple localities and multiple decades. We also discuss ethnographers' experiences about discussions that suddenly start to trouble our earlier interpretations and seduce to new questions and new studies. These discussions might take place within the field with the informants, as well as with other researchers or people in other contexts. They have methodological value when conceptualizing understanding about research questions and

focusing the gaze of the ethnographer as well as in analysis and interpretation. Empirically, we present examples of processes by which constructions of a 'normal child' are discursively produced in implicit ways in various educational contexts and how these constructions tend to pathologise children from poor or ethnic minority families. We use here two examples, both of which draw from collaborative and cross cultural analyses of various ethnographic data. The first example analyses the construction of a 'special student' in a lower secondary school in post-communist Estonia, with reflections on what is regarded as

'normal' behavior in Finnish schools. In the second example we suggest how 'normal' childhood and youth is represented and how

the 'normality' of a particular child, a young person or a family is evaluated.

## **Pictures from the Field in Ayanis (Van) Turkey: Ethical Dilemmas as a Panacea for the Strains of Researchers**

**Nuran Erol-Isik**, Izmir University of Economics | [nuran.erol@ieu.edu.tr](mailto:nuran.erol@ieu.edu.tr)

Sociology is a discipline which deals with dualities embedded in social life. Ethnographic methods help sociologists to understand the ways in which people resolve various ethical dilemmas in everyday life. While sociologists study the construction and resolution of ambivalent situations in the eyes of subjects they observe, they also experience strains which may also help them to develop an awareness about the self-reflexivity of their work in the field study. The paper will focus on evaluating these conflicts and tensions by providing examples from ethnographic field work collected in Ayanis (Van), Turkey, in 2009 (This has been a project supported by the Tubitak, the National Agency for Scientific and

Technological Research). The paper systematizes the main arguments by (1) drawing on observations about interpretations of different issues such as religiosity, which seems to have been a cultural glue for coping with crises of different kinds, (2) reflecting on observer's own ethical dilemmas oscillating between being an insider or an outsider. There will be evaluations on the ways in which discursive strategies used in the field function as a 'social leveler' for the field worker in remembering and reminding his/her position in the field. The paper will exemplify the major arguments through a series of anecdotes and incidents experienced in the field.

## **Telling with "Playing Cards"**

**Tiina Tiilikka**, University of Tampere | [tiina.tiilikka@uta.fi](mailto:tiina.tiilikka@uta.fi)

The presentation discusses how interviewed paramedics' tell about their work experience and use particular material artifacts, which are named as "playing cards". The aim is to analyse how the paramedics describe their work and how they construct shared understanding about the movements from one discussion theme to another. The data includes eight interviews of paramedic teams. The group interviews were conducted during the paramedics' shifts. This meant that if the alarm was sent from the dispatching center to the paramedics' mobile phones, the paramedics had to suspend the interview and continue it until the job done. The group interviews included a pack of paper cards and one photograph with specific instructions or themes. The method appeared usable in

paramedic context since it enabled the temporary suspensions of interviews that took place due to the ambulance calls. The idea was that one paramedic chose one card from the pack of cards and then the paramedics started to talk about the theme presented in that card together. Irrespective of how the method was presented to the paramedics, they named and used the cards as "playing cards". The paramedics discussed the themes and negotiated together about when it is time to move on to the next card. The paper presents how these movements from one card to another took place and how paramedics described their work by using game metaphors. The presentation is based on an ongoing study of the collaborative work practices of paramedics that provide

emergency care for the patients on the scene of an accident or incident.

## **a02RN20 - Creative Occupations in Qualitative Research**

Chair(s): Izabella Wagner

### **The Sociologist Dancer – Pros and Cons of Auto-Ethnography in Studying Hidden Processes in Ballroom Dancing**

Mariusz Finkielsztein, University of Warsaw | [mariusz.finkielsztein@gmail.com](mailto:mariusz.finkielsztein@gmail.com)

Being a sociologist and a dancer provokes specific perspective of investigation. Auto-ethnography as a qualitative method puts researcher both sides: as a subject and an object of scientific exploration. Data are derived from member's observation and are analyzed using sociological apparatus. There are some phenomenons which can be detected practically only by dancer (insider), but others, for the same reason, can remain invisible, because they are too obvious. Such perspective also allows be more critical towards outsider's researches, because as says social psychology, "our" group is always more complex and

peculiar than others. The aim of this presentation is to show pros and cons of auto-ethnography as method of investigation by example of ballroom dancing. There will be also presented phenomenon of Matthew effect, concept popularized by Robert Merton, in the field of sport dancing. This effect describes mechanism of underestimating works of less-known performers and overestimating works of famous ones. On this process I will try to demonstrate how auto-ethnography works in practice, and how useful and in the same time, awkward this method can be.

### **Participant Observation and Creative Occupations in Theatre**

Wojciech J. Sobolewski, University of Warsaw | [wojciech.j.sobolewski@gmail.com](mailto:wojciech.j.sobolewski@gmail.com)

The paper tackles the subject of whether the structure of the institution reflects the everyday life division of labour. Production of a theatre play is a long and complex process and it requires technical, administrative and creative background. The institutional division mentioned above reflects the „common sense” idea that being an artist means being creative. The study conducted in one of Polish theatres shows that while the core activity is still reserved for the typical creative occupations such as actors, writers and/or dramaturgs and directors, the process of creating a theatre play is much more complex and requires what Howard S. Becker presented as the idea of

production of art as a joint venture of network of people sharing a certain knowledge and means. The process of production of a theatre play is divided therefore into a non-creative preproduction stage and a creative rehearsal stage. Both stages are closed to the outside world. Therefore in order to gather accurate data, one has to become a member of the theatre world. Participant observation is a controversial method which allows full access to the theatre. As a stage manager I was situated in the theatre structure between the creative and non-creative occupation. Thus, thanks to the covert participant observation I was able experience everyday life of the

institution and reflect on the official and actual division of labour and distinction between creative and non-creative. I argue that

participant observation is the best method to research art worlds such as theatre.

## Qualitative Methods and Artists Careers. An Interview with a Japanese Dancer

Beata M. Kowalczyk, Warsaw University | [beakowalczyk@yahoo.fr](mailto:beakowalczyk@yahoo.fr)

Social research focused on professional careers of artists can be based on the premise that there is no one pattern to be followed in that field and that therefore each artist has to create (social constructivism) one's career (in)dependently. Such a manner of constructing one artistic way in order to achieve professional perfection and a success one day in some cases should be analyzed in terms of broadly construed interpersonal relations and their quality. This approach is compatible with the idea of "career" proposed by symbolic interactionists, who define it as a set of interactions of different quality. Unveiling the plethora of indiscernible details, acquaintances or events, which constitute one's professional trajectory, in order to reconstruct and analyze social process of career making requires and justifies the application of qualitative methods

such as ethnography, participant observation and unstructured interviews with the actor to social studies in this domain. Given this, in my presentation while highlighting advantages of applying qualitative methods to an analysis of European Careers of Japanese Artists, I shall also point out difficulties and problems, which may arise in the course of an interview conducted with a respondent in his mother tongue, who originates from such a different from linguistic and cultural point of view area. Main concerns will be related to such issues as: problem of formulating question, understanding and interpreting responses; relevance of acquired data; culturally-dependent (over)interpretation of the information etc. Finally I shall also try to delineate possible solutions to the aforementioned dilemmas.

## b02RN20 - Ethnography II

Chair(s): Christoph Maeder (PH Thurgau, Switzerland)

## Doing Organizational Ethnography. Methodological and Ethical Dilemmas

Piotr A. Chomczyński, University of Lodz | [chomczynski@gmail.com](mailto:chomczynski@gmail.com)

The presentation shows the methodological part of postdoctoral studies encompassing research on reformatories for young delinquents in Poland. The paper covers some methodological and ethical problems concerning doing organizational ethnography in reformatories, which can be seen as total institution in Erving Goffman's typology. There will be addressed the question of creating researcher's identity and how it changes in

closed environment typical for reformatories. Researcher's identity is created during the process of making long-term direct quasi-participant observations and carrying semi-structured interviews. All the researcher's decisions concerning his/her performances and relations with observed people result in present and future research activities and chance to get valuable data. In total institution a researcher is often tested on his loyalty

toward informants before he/she will be delivered some important information (about some informal rules, code, etc.). The results of these trials may determinate his/her reliability among inmates and access to crucial data. Presentation also addresses the question of

balance between the effective ways of obtaining high quality materials and ethical issues connected with total institution reality and specific conditions of gaining data (keeping secret information, winning trust of inmates and staff).

## **Microstructures of Professionalization in Teacher Training: The Participation in School Practices through Discursive Positioning in Counselling Sessions for Learning**

**Katharina Scharl**, University of Education, North-Western Switzerland (FHNW) | [katharina.scharl@fhnw.ch](mailto:katharina.scharl@fhnw.ch)

**Daniel Wrana**, University of education, North-Western Switzerland (FHNW) | [daniel.wrana@fhnw.ch](mailto:daniel.wrana@fhnw.ch)

In the MIPS study (SNF, 2011-2013), we explore the development of thinking the professional world. Our main research question examines future primary teachers' understanding of 'teaching' and 'learning' via a poststructuralist approach with natural data of counselling Sessions for learning in teachers training. We understand professionalization as a process of growing participation in a knowledge field of professional "communities of practice" (Lave & Wenger 2001). Therefore, we analyse the articulated knowledge constructions as moments of professionalization arising from discursive performative practices. But the educational knowledge field is organized by various knowledge orders, which offer diverse positions within the discursive space of professional action. For subjectivization, discursive work in form of "positioning" (Davies & Harré 1990; Hollway 1998) is required. We

observe these processes of "meaning making" (Saljö 2009) through positioning as a fundamentally relational phenomenon: Depending on the adopted position and the iterated practices, 'teaching' and 'learning' can be thought of differently. In the interaction, student's 'doing teacher' can compete or conflict (cf. Lyotard 1988) with the teacher educators' understanding. Through the linkage of addressings, interpellations and recognitions, variable strategies of discursive positioning are revealed, tracing them in terms of fragile movements inside the discourse space of positioning options. We will show, how positioning evolves at the intersection of counselling practices and practices of 'schooling' and, accordingly, what discursive tools the actors deploy. In addition, we give insight in the poststructural analysis of social practices (Wrana 2012)

## **Positioning between Insiderness and Outsiderness: Contextuality of Identities in the Fieldwork**

**Murat Küçük**, Mardin Artuklu University | [muratku@gmail.com](mailto:muratku@gmail.com)

This paper aims to reveal how different domains of identity play role in research on intersectionality of identity in the case multicultural Mardin, Southeastern Turkey.

Data used in this paper is based on ethnographic research conducted in Mardin between September 2010 and June 2012 for my master thesis. Due to religiously and ethnically

diverse quality, belongings are quite strong to make and sustain relations, to solve problems and to establish trust for inhabitants. Therefore Mardin is a quite suitable site for studying identity. During the fieldwork process, my multiple identities and researcher status played a significant role in interviewing with inhabitants and living in the town to generate data. In this paper, I will discuss insider and outsider positioning in terms of signs of identity including ethnic and religious backgrounds, not being of native Mardinian, class and professional position, settlement choice, political views, and uses of languages. Living in the research site or studying in the

living place provided me an opportunity to participate in and observe the life experienced in the city, in addition to narratives generated by interviewing. It became a process for me to understand and discover reflections of different identity expressions on daily life. This researching and writing process in this multicultural site also made my belongings more explicit, and provided me rethinking of my own identity perceptions. Finally, this paper tries to reveal where, why and how my belongings become important or burden to contact and interview with inhabitants during the fieldwork.

## **Meanings of Weekend in Substance Abusers' Change-Related Talk**

Harri Sarpavaara, University of Tampere | [harri.sarpavaara@uta.fi](mailto:harri.sarpavaara@uta.fi)

This paper explores the meanings substance-abusing clients attach to weekend during motivational treatment sessions in the context of Finnish Probation Service. By applying Charles Peirce's semiotic theory of signs, this paper examines client's change-related talk utterance about weekend as a symbolic sign, and analyzes: 1) What kind of meanings the clients attach to it? 2) What does weekend mean to the clients' motivation to change? The present study is based on videotaped and

transcribed data consisting 98 motivational treatment sessions. The data analysis reveals that the general meaning of weekend is constructed as an obstacle to change. Weekend stands for an excuse to drink, a need to drink, a desire to drink and incapability to change in the clients' talk. The results show that by applying qualitative approach new and significant meaning constellations can be found in the client's talk during motivational counseling.

## **a03RN20 - Roundtable Session: New Issues in Qualitative Research I**

Chair(s): Lukas T. Marciniak (University of Lodz)

### **How Citizens Legitimize the European Union. A Qualitative Project-Oriented Approach: From Conceptualisation to Empirical Framework**

Heidi Mercenier, Université Saint-Louis, Bruxelles | [mercenier@fusl.ac.be](mailto:mercenier@fusl.ac.be)

The paper presents the first phase of our thesis. It aims to provide theoretical and empirical reflections justifying the investigation of the legitimization of the

European integration by citizens from a qualitative perspective. The paper aims to accomplish two goals. Firstly, the paper provides theoretical reflections on the

necessity to investigate the question of legitimacy of the European integration process from the grassroots. It outlines the relevance of analysing this macro question with a 'microscope'. It proposes novel insights into this question by adopting a project-oriented approach, linking the theories of legitimization with those of policy feedbacks. In this way, it presents ideas on the necessity of investigating the citizens' perceptions of two European fields - freedom of movement, migration policies and border control - in order to deepen our understanding of the legitimization of the EU.

Secondly, this paper links this analytical framework to empirical research by analysing the conceptualization of these reflections and proposes to discuss the research design elaborated to conduct our future focus groups (October 2013). Essentially, this paper seeks to provide reflections on how to add to the base of knowledge that exists about how citizens think about Europe. In so doing, it provides methodological reflections on the way to conduct qualitative research aiming at evaluating the European integration process.

## Discourse Practices and Patterns Online. Methodological Foundations and Implications

**Vivien Sommer**, Chemnitz University of Technology | [vivien.sommer@phil.tu-chemnitz.de](mailto:vivien.sommer@phil.tu-chemnitz.de)

**Claudia Fraas**, Chemnitz University of Technology | [claudia.fraas@phil.tu-chemnitz.de](mailto:claudia.fraas@phil.tu-chemnitz.de)

**Christian Pentzold**, Chemnitz University of Technology | [christian.pentzold@phil.tu-chemnitz.de](mailto:christian.pentzold@phil.tu-chemnitz.de)

Discourses can be defined as discursive practices and structures, which are realized in convergent, trans-medial arrangements. Digital communication so far presents the culmination of mediatization processes. In online communication on the Internet it's often difficult to distinguish between information processing, storage and circulation. Therefore online discourses can be conceptualized on the one hand as discursive practices in terms of manifest, observable and describable practices of a production of statements, which are manifested on the other hand as patterns in spoken or written language usage, and as visual and creative actions. In our presentation we would like to discuss methodological foundations and implications of how discursive patterns of practices and structures—especially of online discourses—can be reconstructed not only on parallel levels, but

also in their connection. One possible approach that we want to present and discuss is the triangulation of discourse analysis based on document analysis with ethnographic approaches based on participant observation. The following questions would lead our methodological discussion: The World Wide Web can't be described as physical geographical communication room. How can online discourses be defined as ethnographic fields? By what methodological strategies is it possible to connect the offline data collection of discursive practices with the data collection of discursive production and practices on the Internet? Ethnographic approaches usually examine social action in a copresent and simultaneous way, whereas discourse analysis reconstructs its objects of research in a retrospective way. How can this conflict be resolved for their triangulation?

## Some Implications of Josef Mitterer's Work for Qualitative Methods

Jerzy Stachowiak, University of Lodz | [jerzystachowiak@gmail.com](mailto:jerzystachowiak@gmail.com)

Josef Mitterer's critique of dualistic mode of speaking (The Beyond of Philosophy, 1992 and The Escape from Arbitrariness, 2001) has attracted a considerable attention however the audience still remains rather narrow. Needless to say, the most vigorous reactions came from the field of professional philosophy. Nevertheless, the potential implications and practical importance of delineating the opposition between dualism and non-dualism are much wider and lead to the heart of methodological concerns of qualitative social research. There are two separate but interrelated goal of this paper: on the one hand, to demonstrate to what extent qualitative methods would have to be modified or redirected if Mitterer's radical conclusions on

dualism were adopted. On the other hand, it is shown that it might be highly fruitful to put Mitterer's non-dualism to work with some of the well-established sociological perspectives grounded in detail-oriented qualitative research. Since much of Mitterer's claims are grounded in a specific type of analysis of talk, rhetoric and argumentation, in this paper a thorough focus is aimed at the discourse analysis. It shall be fostered that qualitative discourse analysis could be conceived as a genuine ground for considerations on advantages and drawbacks of non-dualism. Among others, what is called the essential reflexivity of accounts or indexicality of expressions could be taken as challenging points of reference.

## Managing Cultural Discontinuities in Data Collection: Methodological Strategies

Carla Rodrigues, Amsterdam Institute for Social Sciences Research | [carla.rodrigues@iscte.pt](mailto:carla.rodrigues@iscte.pt)

Telmo Clamote, ISCTE-IUL, Lisbon | [telmoclamote@net.sapo.pt](mailto:telmoclamote@net.sapo.pt)

Elsa Pegado, ISCTE-IUL / Lusophone University of Humanities and Technologies, Lisbon | [elsa.pegado@iscte.pt](mailto:elsa.pegado@iscte.pt)

Hélder Raposo, ISCTE-IUL / Lisbon School of Health Technology (ESTeSL-IPL), Lisbon | [helder.raposo@gmail.com](mailto:helder.raposo@gmail.com)

Noémia Lopes, ISCTE-IUL / Egas Moniz, CRL, Lisbon | [nlopes@egasmoniz.edu.pt](mailto:nlopes@egasmoniz.edu.pt)

The collection of data from socially and culturally heterogeneous populations poses methodological control challenges in the choice of techniques, in the construction of the observation instruments and in the process of inquiry. These challenges are even more

expressive when seeking to study practices of a more private nature, or practices with which the subjects have uneven levels of familiarity. This is the case of on an ongoing research about therapeutic consumptions to enhance physical, intellectual and social performance,

among the young population in Portugal. This paper aims to present a methodological reflection about the strategies used to overcome several obstacles when approaching this topic within a highly heterogeneous population - including young people both studying at university and without higher education, as well as from different geographic contexts (urban and rural). We used a mixed methods approach, including focus-groups in an exploratory stage (n=58), followed by a survey (n=1500). The challenges encountered can be systematized around three major issues. First, the difficulty to obtain interested

and available participants, especially in contexts culturally more distant from research and academic procedures. Second, the specificity and private nature of these kinds of consumptions required a greater control in the way the different topics were introduced, in order to reduce social constraint and to enable the deep exploration of the theme. Third, in a research that privileges lay rationales, the lack of familiarity regarding these consumptions in some sociocultural groups entailed a particular effort to operationalize our theoretical concepts into intelligible categories.

## **"I Can't Live without Climbing" – Analysis of Climber's Blogs as a Part of the Research on Social World of Climbing**

**Anna M. Kacperczyk**, University of Lodz | [anna.kacperczyk@gmail.com](mailto:anna.kacperczyk@gmail.com)

The paper refers to peculiar form of auto presentation of climbers and mountaineers that publish autobiographical materials on their blogs. The analysis is a part of broader research project on a social world of climbing that is being conducted for 5 years. In this part of my analysis I consider possibility of using these virtual diaries and memoirs as an additional form of data in the research on social world of climbing. I base my conclusions on analysis of a few dozen of climbers' and mountaineers' internet blogs. The analysis shows that visualization of acting and depiction of the space of activity play a vital part in bloggers' identity constructing. Blogs' analysis

make possible to follow biographical processes and gathering data during long time. Few years of writing and publishing posts on the blog reveal personal stories, firsthand accounts from expeditions, reports on events and situations, announcements of own preferences and attitudes, sharing experiences and commitment in a social world of climbing. Moreover, they remain a form of leaving own trace in the world, presenting own unique view, and identity constructing process. I discuss the role of biographical materials in the research on a sport activity of climbers and mountaineers.

## **Methodological Innovation and Uncertainty. The Example of a Content and Discourse Analysis of an Intellectual Tug-of-War**

**Konstantinos (Costa) Delimitsos**, EDSHPT - Université de Savoie | [konstantinos.delimitsos@univ-lorraine.fr](mailto:konstantinos.delimitsos@univ-lorraine.fr)

Since the late nineties, the French crime research arena has been the theater of a long controversy as the great majority of established scholars severely criticizes the works and postures of a handful of "urban

violences and security" experts occupying numerous crucial positions within the counter crime decision-making process. This controversy, which seems to be much more than yet another intellectual tug-of-war, is the

object of a sociology thesis aiming to analyze the scientific relevance but also the rhetoric, the means of reasoning and the representations that each side convey. From defining the field to elaborating appropriate observation instruments, undertaking such a content and discourse analysis is quite a complicated task, especially as it requires the comparison of (would be) scientific literatures, a process which raises a series of methodological and even epistemological questions: can different theoretical and empirical approaches of the same social phenomena become the object of a

comparative analysis, and if so, how? In what degree are different corpuses of texts likely to be rigorously categorized and thus compared and contrasted regarding their accuracy and scientific validity? And in the long run, is scientific rigor a measurable study object in the field of social science and by what means? Based on an ongoing empirical research, this paper presents some of the innovating answers given to those questions, while pointing out the degree in which methodological innovation and uncertainty sometimes go hand in hand.

## **How to Advance the Field of Health Communication: Allowing the Underdog to be Equally Distributed and Empowered**

Janelle Applequist, The Pennsylvania State University | [jra5032@gmail.com](mailto:jra5032@gmail.com)

This research further explores the objective of studying health communication and whether researchers are taking all necessary measures in order to achieve goals of patient advocacy. An often times unspoken, but many times emphatically declared, contention within the field of health communication exists where qualitative health communication is not given equal representation in academia. Health communication research published within scholarly journals and in public domains, on an international scale, has been biased toward quantitative research. The “quantitative versus qualitative debate” has been well underway since the innovation of health communication as a research field, however; until presently, the voices advocating on behalf of the need for

delineating and deconstructing the personal stories of physicians and patients have not been as prominent as those arguing for numerical evidence. This research uses a qualitative content analysis to investigate the presence of quantitative, qualitative, and mixed-methods health communication research. In a field that rests on patient care and understanding, it is unethical for researchers and journals to under-utilize qualitative work. Perhaps the best resolution possible in order to cultivate patient care is not to choose one method over another, but rather, by exposing that the less-prevailing method is just as salient, the solution lies in an equal distribution of both methods.

## a04RN20 - Roundtable Session: New Issues in Qualitative Research II

Chair(s): Maggie Kusenbach (University of South Florida, Tampa)

### Sociological Supervision. Towards Methodological Competence of Qualitative Researcher.

Łukasz Rogowski, Adam Mickiewicz University in Poznań | [lukasz.rogowski@gmail.com](mailto:lukasz.rogowski@gmail.com)

Qualitative sociological research is becoming more complex, which results mainly from the interdisciplinarity of research problems and new technologies used to collect data. „The Invisible City” („Niewidzialne miasto”, <http://www.niewidzialnemiasto.pl/>) is one of the examples of very complex qualitative research projects. This nationwide project, researching „the everyday urbanism” and its visual indicators, consisted of 100 photo-elicitation interviews, 20 participant observations and analysis of several thousands pictures. In my speech I will focus on the final stage of the project, when in online questionnaire the researchers collected their own methodological experiences, such as: (a) advantages and disadvantages of research tools, (b) ways of communicating in the research team and building relations with the

respondents, (c) methods of popularizing the results of the project. I will refer to this stage of the project in two ways. First, I would like to describe it both as a form of „sociology of qualitative research” and a type of „sociological supervision”: What are its functions?; at what stage of the research process should it be carried out?; who should carry it out?; what research techniques should it use?; does it affect intersubjectivity of terms used in the research?; does it increase the methodological reflexivity of the researchers? Second, referring to data collected in our „supervision” of The Invisible City, I would like to outline methodological competence of a qualitative researcher, which may be called „IPARI”: (Intuitive research tools; Practical training; Anti-essential character of terms; Relational analysis; Impact on social world).

### Heterogeneous "Cliques" at School: An Empirical Contribution to Social Spaces of Interaction and Collective Experiences

Cornelia Hippmann, University of Dortmund | [cornelia.hippmann@tu-dortmund.de](mailto:cornelia.hippmann@tu-dortmund.de)

Oktay Aktan, Technical University of Dortmund | [oktayaktan@tu-dortmund.de](mailto:oktayaktan@tu-dortmund.de)

The aim of this abstract is to discuss the various group formations inside the system school with a particular view at the peculiarities of peer group cultures that are compared in this social space. This research focuses on the analysis of different orientations of situations in life. To gain extensive facets 24 group discussions with cliques from different 9th grades in six Grammar and Comprehensive Schools in the Ruhr Region, Germany and the analysis of their video recordings serve as an empirical basis.

This study focuses on both: the subjective perceptions as well as the actions of the youth in the peer groups. That way offers the possibility to describe their construction in the field of their interaction, and this one can be reconstructed within the framework of their common experiences, too. Two perspectives are implicitly connected, i.e. both, the diachronic as well as the synchronic perspective. While the synchronic perspective looks at the interaction processes between the members of the cliques (video analysis), the

group discussions with the heterogeneous peer groups make it possible to register the diachronic perspective, and consequently the experiential contexts of their cohesion and the processes of getting their gender-identity. The following questions must be arisen: How heterogeneous are the groups with regard to their culturally acquired arrangements? How

important is friendship for the mutual support and the building-up of collective orientations in the social space of the school? To what extent has gender got influence on the composition and cohesion of peer-groups in interaction with ethnicity, social background and other categories?

## Evidence, Meta-Analysis, Generalization as Challenges for Qualitative Research

Uwe Flick, Alice Salomon University of Applied Sciences, Berlin | [flick@asfh-berlin.de](mailto:flick@asfh-berlin.de)

Qualitative Research is extending beyond the disciplines of its origin. It is more and more moving into more applied fields of research like health and health systems research for example and faces new challenges in these contexts. (1) For example in health sciences the call for demonstrating evidence with results produces new questions for qualitative research/ers: What is evidence in qualitative research, what is its impact of this concept on the research process in qualitative research and how can qualitative researchers respond to this challenges? (2) Trends to meta-analysis and re-analysis of qualitative data are developing in several of the above contexts. Again this is a challenge which is difficult to

ignore if further establishing qualitative research is an aim. What are the consequences for the ways qualitative research has been done so far? (3) Generalization is still a challenging issue for qualitative research. What are the ways discussed in this respect and what does that mean for qualitative research in general? These issues will be discussed on the background of reflections resulting from editing the Handbook of Qualitative Data Analysis (Flick 2013). A major point of reference will be the diversity of qualitative research approaches and how this is represented in discussions about the topics mentioned above.

## b04RN20 - Emotions in Qualitative Research I

Chair(s): Marie Buscatto (Université Paris 1 Panthéon Sorbonne)

## Digital-Vignette: A New Analytic Device to Capture and Share the Interpretation of Qualitative Data

Manuela Ferrari, Centre for Addiction and Mental Health (CAMH), Toronto | [manuela.ferrari@utoronto.ca](mailto:manuela.ferrari@utoronto.ca)

This paper presents digital-vignette, short digital videos, as a new analytic device to capture the interpretation of qualitative data in an evocative episode able to promote personal awareness, reflexive practice, and stimulate

dialogue among health practitioners. During the presentation, three digital-vignettes, developed using the Beyond Obesity and Disordered Eating in Youth (BODY) study data, a qualitative project aimed at exploring the

discourses that circulate regarding the relationship between the eating disorders and obesity prevention fields, will be shown to the audience to describe and discuss the value and insights of this new analytic device. BODY study data has been collected across Canada through interviews conducted with 35 practitioners who work in either eating disorders or obesity (for a total of 55 in-depth interviews), six focus groups and 12 in-depth interviews conducted with 26 youth. Within digital-vignettes, quotations are combined together to compose a script that represents the research themes. Final data interpretation

is depicted through the characters, set decorations, light, and music, which describes the data theorization. The presentation aims are as follows: First, to discussing the process of moving with and through the qualitative research paradigm and aesthetic values as a way for creating, perceiving and responding to qualitative data, its visual representations, emotionally as well as aesthetically; Second, to show how a digital-vignette can foster critical self-reflection and constructive dialogue among health professionals, so that they can share knowledge and deliver health promotion strategies in an informed and integrated way.

## **Analytic Challenges: Situating Play Fights in Youth Care Institutions**

David Wästerfors, Lund University | [david.wasterfors@soc.lu.se](mailto:david.wasterfors@soc.lu.se)

Ethnographic studies of play may generate several analytical issues. Should an analyst be sure about what is play and what is not? If a play frame emerges, do we need to mark out its beginning and end? What do members accomplish with a play situation, and how do they contextualize it locally? This presentation discusses these problems by exploring fieldnotes on how members of youth care institutions ('homes' for young criminals) enact and respond to play fights in ways that (i) make physical contact institutionally accountable, (ii)

soften and transform controversial 'masculinity shows'. As staff and youth accommodate play into their institutional setting, they key various strips of interactions so that frames of play and non-play are laminated. Staff seem to accomplish 'treatment' or 'learning' by down-keying play fights to slots of caring, and youth may create identificatory respite by playing with make-believe violence – and by playing with the play fight definition.

## **Migrant Identities in Research: Methodological Considerations about Positionality**

Sara de Jong, University of Vienna | [sara.de.jong@univie.ac.at](mailto:sara.de.jong@univie.ac.at)

In this presentation I will discuss the methodological implications of my research project about NGO workers in Austria who are supporting asylum seekers in their work and who are refugees themselves. An important analytical question for this project is whether identity is understood as constituting knowledge, or in more practical terms, whether these employees are expected to offer 'authentic' knowledge and insights into the migration experience due to their own refugee background rather than on the basis of their

professional expertise. In the semi-structured narrative interviews, the NGO workers themselves report the significance of empathy and shared (war) trauma for their relation with the asylum seekers who are their clients. Identity and emotions however also play a key role in the empirical data collection process. These methodological issues can only be understood in the context of a society which is generally hostile to migrants, which essentialises ethnic identities and differentiates between migrants. While the

interview setting is structured by the conventional power dynamics between researcher and interviewee, this is complicated in productive ways by the fact that the researcher is a recent migrant to Austria compared to the research participants and that the interview is conducted in German, which the research participants speak more fluently

than the interviewer does. At the same time, while the research participants relate to the researcher on the basis of their shared outsider status in Austrian society, this neither negates the privileged migrant status of the researcher nor the fact that she does not share the particular emotions of trauma and pain the interviewees express and relive.

## **Techniques of Visual Sociology as a Key to Understand Young Adults (Relation between One's Clothing and Self-Identity)**

**Gabriela - Żuchowska**, Jagiellonian University of Cracow | [g.zuchowska@gmail.com](mailto:g.zuchowska@gmail.com)

Contemporary sociology proves that the qualitative turn or 'everyday life turn' was crucial to understand contemporary people and contemporary culture. We are currently searching for new 'soft' methods and more reflexive approach to a growing number of fields and social phenomena. My presentation will show the advantages of such perspective, especially the use of visual methods that spread through different fields of sociology and anthropology. Firstly I will shortly present techniques of using and interpreting photographs in sociological study and reasons for which their use may be essential when exploring some topics and problems, along with conceptions that highlight the importance of the visual in post-modern culture (Banks, Baudrillard, Berger, Crane, Sontag, Sztompka,

Pauwels, Willis). Secondly, I will explore the methodological question of how to reach complex and authentic data on young adults (ones living in a computerized and thoroughly iconized world of popular, post-modern culture), especially on hard to reach questions of their self-identity, attitudes and preferences or shared values. I will try to prove how visual methodology such as photo-elicitation interview and analysis of pictures - supporting techniques of in depth interview and focus groups - can lead to valuable information and deeper understanding of young adults. This discussion will be exemplified by results of my own PhD research project (on how self-identity is constructed and presented by a personal clothing style).

## a05RN20 - Interviews

Chair(s): Shalva Weil (Hebrew University, Israel)

### Anonymising Interviews for Data Sharing: The Practical Research Ethics of Protecting Participant Identities

Benjamin Saunders, University of York | [saundersbm@cardiff.ac.uk](mailto:saundersbm@cardiff.ac.uk)

Celia Kitzinger, University of York | [celia.kitzinger@york.ac.uk](mailto:celia.kitzinger@york.ac.uk)

Jenny Kitzinger, Cardiff University | [kitzingerj@cardiff.ac.uk](mailto:kitzingerj@cardiff.ac.uk)

Our research is based on interviews with around 50 family members of people who are (or were) in persistent comas, vegetative states and/or minimally conscious states. This is a small group of families dealing with extremely difficult situations concerning end-of-life care served by an even smaller group of specialised consultants, lawyers etc. In interview they talked about sensitive personal, social medical and legal issues affecting their loved one. In sharing the interview transcripts with our research group - an interdisciplinary group of more than 10 researchers across two universities comprising the York-Cardiff Chronic Disorders of Consciousness research group - and in subsequently preparing the data for publication and for future archiving, we aimed to conceal interviewees' identities, and those of the people they talked about. This is

usually called 'anonymity' - a simple word for a complex, and far from water-tight, process which creates a tension between respecting confidentiality and maintaining the value and integrity of the data. Changing the names of people and places etc is only the first step in a more complex process in the management of 'identifying details'. This paper examines the issues that arose handling this data, based on empirical examples which invite discussion of the choices others might make in similar situations. They include issues relating to research with more than one member of the same family, our interviewees' use of social media, the place of potentially identifying attributes (personal ethnicity, occupation, sexual identity) in constructing interviewee's experience, and the personal revelations of the researchers in the course of the interviews.

### Second Thoughts on Interviews: the Motives of the Interviewees

Ivonne Kuesters, Technical University of Dortmund | [ivonne.kuesters@tu-dortmund.de](mailto:ivonne.kuesters@tu-dortmund.de)

In spite of the recent shift to ethnographic and visual methods interviews still remain the most prominent research method in qualitative sociology. Unfortunately, and unfavourable for the quality of the research, several basics of the interview method have been left in a rather unreflected state. Among these darkish areas of the method are the motives of the interviewees for giving interviews: Why do people give interviews to sociologists, inviting complete strangers into their homes or offices,

talking to them for one, two or more hours about private matters, giving themselves in into intense and often challenging conversations? These motives, their variety and the conditions for their occurrence in certain interview constellations, have to be reflected more accurately in order to gain the crucial knowledge of how they influence the interview, and if they are represented in the text of the interview. This presentation will examine and systematise existing

considerations of the motives for giving interviews, point out their inadequacies, especially in capturing the interaction during the interview, and provide a more thorough and generalised set of motives, their causes and their consequences for the interaction during the interview and the content of the interview. This effort will be based on the analysis of

empirical material, drawing from a stock of 86 interviews (narrative and semi-structured interviews and interviews with experts) from various sociological research contexts: from exploratory interviews in the artistic field, interviews in the context of inequality research to evaluation interviews in the scientific field.

## Creating a Space for Dialogue on Moral Dilemmas through a Questionnaire

Anne Kristine Haugestad, The Norwegian University for Science and Technology (NTNU) | [akhauges@online.no](mailto:akhauges@online.no)

This paper presents and discusses the qualitative research design which was developed during the research project "Norwegians in the Global House: On Norwegians' attitudes towards cosmopolitan values and global regimes of resource quotas". The aim of the project was to explore the narrative and normative resources people use when dealing with moral questions related to sustainable development. To achieve this, 28 men and women from 15 political parties were interviewed and different aspects of resource consumption and global justice were discussed. Each interview was staged as a conversation about 24 moral dilemmas. The dilemmas were presented in a questionnaire which served as an interview guide. To handle

the moral dilemmas the interviewees made use of available narrative and normative resources – both those resources accumulated through each interviewee's lived history, and the resources that were made available through the questionnaire. The questionnaire created a conversational space which in some respects was equal across all interviews. This facilitates comparisons between the interviews. In other respects, however, the interviews differ enormously. The paper concludes that this research design turned out to be a fruitful combination of qualitative interviews and a premade questionnaire. The design can easily be adapted to other types of qualitative interviews and the paper includes a "cook book" on how to do this.

## The Management of Prior Knowledge in Problem-Centred Interviewing

Herwig Reiter, German Youth Institute | [reiter@dji.de](mailto:reiter@dji.de)

The management of various forms of prior knowledge at the different stages of preparing, doing and processing interviews is among the practical and methodological aspects of qualitative interviewing research. How much, and what do I need to know about the issue in advance? How do I make use of this knowledge during the interview conversation? And how is my prior knowledge gradually transformed into comprehension in the confrontation with the practical perspective of the interviewee? The paper discusses the methodological status and

practical use of different forms of prior knowledge in the context of the problem-centred interview (PCI). The PCI is one of the systematically elaborated and recognised techniques of qualitative interviewing. It was developed in Germany by Andreas Witzel in the 1970s and 1980s, and it is now introduced to the international scientific community in an English monograph (Witzel/Reiter, 2012, *The problem-centred interview*, Sage/London). The PCI suggests resolving the tension between deductive and inductive aspects in the process

of discursive-dialogical reconstruction of socially relevant problems by bringing the researcher's prior knowledge and the respondent's practical knowledge into a corrective relationship. Prior knowledge is part of the researcher's preconception of a specific problematic that enters the immediate

interview interaction in a sensitizing way. By being confronted with the interviewee's practical perspective, it generates pre-interpretations on the part of the interviewer that get the chance to be clarified, revised or corrected in the course of the conversation and interpretation.

## **Interviewing and Surveying over the Phone: A Reflexive Account of a Mixed-Methods Research on Parenting**

**Dafne Muntanyola**, Autonomous University of Barcelona | [dafne.muntanyola@uab.cat](mailto:dafne.muntanyola@uab.cat)

**Pedro Romero-Balsas**, Autonomous University of Madrid | [pedro.romero@uam.es](mailto:pedro.romero@uam.es)

We present here a paper about the role of the phone in a mixed- methods research. This work is framed in a wider research project called "The Social Use of Parental Leaves in Spain" funded by the Spanish Ministry of Science and Innovation and directed by Prof. Dr. Gerardo Meil. Recent sociological literature on methodology tends to identify the use of the phone with quantitative surveying, while phone interviews are considered a less than desirable outcome for qualitative approaches. We believe such polarization does not contribute to a better understanding of the phone as a tool for research in social science. On the contrary, what is needed is an account of a research design with the phone as the only communication tool between researchers and subjects. Our object of study is a mixed-methods case study on the use of parental leaves by Spanish fathers that took place in 2012. The fieldwork included 30 phone

interviews to fathers following snowball sampling, and a phone survey to 4000 individuals between 25 to 60 years of age with children under 13. We analyzed our own experience as interviewers on the field in the qualitative phase, as well as face to face interviews to key informants of the phone survey, which was outsourced to the "Centro de Análisis y Documentación Electoral de Andalucía (CAPDEA) in the University of Granada. We compared the use of both techniques in sampling and design, taking interviewing and surveying as situations for mediated communication. Our findings, which we analyzed with Atlas.ti following the principles of grounded theory, show that the value of the phone as a tool for research is a matter of adequacy to a given methodology, rather than an issue of validity, reliability, or credibility.

## b05RN20 - Democratization of Research

Chair(s): Dominika Byczkowska , Łódź University, Poland

### Communicative Methodology of Research: Scientific Evidence for Social Transformation

Mimar Ramis, University of Barcelona | [mimarramis@ub.edu](mailto:mimarramis@ub.edu)

Carmen Elboj, University of Zaragoza | [celboj@unizar.es](mailto:celboj@unizar.es)

Marta García Lastra, Universidad de Cantabria | [garciama@unican.es](mailto:garciama@unican.es)

The Communicative Methodology of Research (CMR) is a methodological response to the new social demands and needs which has already attained an extraordinary impact in the transformation of situations of inequality and exclusion in the current context of social crisis. Conducting research with the CMR means to involve the persons and social groups investigated throughout the whole research process, in an ongoing egalitarian dialogue with the project's researchers. Through this dialogue, researchers provide the necessary scientific knowledge regarding the reality being investigated and the subjects of the research provide the knowledge from their own experiences and contexts, both of them contributing to the social transformation of their reality going beyond the mere description

and explanation of it. Therefore, research based on this methodology provides scientific tools for the transformation of situations of social exclusion particularly with vulnerable groups, as well as for the development of efficient social policies. In fact, the CMR has already been recognised by the European Commission for its value in scientific work with vulnerable groups, highlighting its relevance to develop socially useful research with greater impact. Qualitative Inquiry, one of the journals on qualitative research with highest impact in the Journal Citation Reports (Social Sciences, Interdisciplinary), dedicated a Special Issue to the conceptual framework and developments of the CMR. This presentation will introduce this framework illustrating its impact with vulnerable groups such as the Roma people.

### Evaluation as a Research Platform for Empowering and Strengthening Civil Society Organisations

Asta H.M. Rau, University of the Free State, Bloemfontein | [rauahm@ufs.ac.za](mailto:rauahm@ufs.ac.za)

The goal of evaluation is to meet the need for constructive critique that can be applied in contexts of ongoing change. Although evaluation is essentially an instrumental undertaking, and although philosophical underpinnings of evaluation methods are rarely made explicit in evaluation reports and articles, in fact the field has well developed ontological and epistemological frameworks. This paper describes a process evaluation of a small South African civil society organisation

(CSO), which was designed and implemented within an overarching critical realist paradigm, applying an emancipatory approach, and using participatory methods. One evaluation aim was to uncover ways for the organisation to improve its programmes and interventions in order to better serve its beneficiaries. But a key offshoot of this was to improve the organisation itself– this goes to the very heart of sustainability and funding crises that local CSOs currently face. I argue that strengthening

civil society– fostering its power to bring about positive change– is vital in building community resilience to large scale societal changes. Part of that power lies in mobilising and developing the skills and abilities of ordinary people who work in CSOs. This paper brings evidence to show how participatory methods were used to help participants learn how to analyse and use

monitoring data they had accumulated over years, how to capitalise on their local knowledge to gather data relevant to the CSO's needs and objectives, and to understand and use logistics in strategic decision-making. In this evaluation we attempted to demystify and democratise research without supplanting the need for and place of expert researchers

## **Succeeding in Publishing Ethnography - Cultural Obstacles in the Sociological Production**

**Izabela Wagner**, University of Warsaw | [wagneri@is.uw.edu.pl](mailto:wagneri@is.uw.edu.pl)

This presentation will focus on the process of publication (papers and books) in the areas of international sociological production. Based on the tools provided by sociology of work and the theory of center/periphery adapted to the academic production I will develop the issue of global competition for publication in the highly ranked journals and prestigious publishing houses of academic book. I will discuss particular situation of the authors of ethnographies (monographs based on the

ethnographical research), who belong to the peripheral institutions in non English speaking countries. The questions of language of writing, translation into English and very important issue - that of cultural roots of our discipline will be elaborated. The presentation handles the issue of the character of our discipline (resonance of the Burawoy-Sztompka dispute about - local v/s global sociology). Some propositions for authors will conclude the presentation.

## **Democratizing the Social Research. Paradox or Sustainable Approach? Toward a Dialogic Relationship between the Researcher and the Social Actor**

**Silvia Cataldi**, University of Cagliari | [s.cataldi@unica.it](mailto:s.cataldi@unica.it)

Participation topic is assuming more and more interest by various social disciplines: from political science to psychology, from urban sociology to evaluation, participation has a new appeal and now talking about participatory approach appears the new frontier of the research. Despite that, the literature demonstrates a lack of methodological reflection on what are the participation effects in the concrete research practices. The aim of this paper is primarily oriented to fill this gap. It begins with a brief overview on how the relationship between researcher and object of study has been approached in epistemology and in social sciences. Moreover, assuming a critical and a reflexive point of view, the paper

asks one essential question: what kind of relationship (and of participation) develops between the researcher and the social actor? To answer this question the paper proposes identifying four different type of participation in social research: an adversarial type based on the acceptance of a dualistic point of view between researchers and social actors; an idyllic type, which is characterized by the negation of the conflict and the imposition of the technical power of the researcher; the institutional type, which is characterized by the negotiation of involvement spaces dedicated to social actors in the research process; and, finally, the dialogic type which assumes the social actor as a real co-protagonist of the

research process. The effects of each participation type are analyzed by rediscovering all the practices that include a particular involvement of the social actor in the

research activities. The paper ends wishing social sciences a new cooperative and emancipatory relationship with its public.

## a06RN20 - Mobile Methods in Qualitative Research

Chair(s): Maggie Kusenbach (University of South Florida, Tampa)

### Mobile Migrants, Immobile Left-Behinds. A Mobile Multi-Sited Approach to the Study of the Transnational au Pair Migration

Mariya Bikova, University of Bergen | [Mariya.Bikova@sos.uib.no](mailto:Mariya.Bikova@sos.uib.no)

During the last few years thousands of young women from the Philippines came to Norway to work as au pairs despite the Philippine Ban of Deployment to Europe from 1998. The ban was lifted in 2010 as a result of which the au pair-migration to Norway took the form of legal temporal migration regulated by a bilateral agreement. The lifting of the ban and Norway being a preferred destination for au pair-placements attracted even more young Filipinos to Norway. Based on mobile multi-sited ethnographic fieldwork in Norway and the Philippines, and approaching the au pair-migration with the notion of global care chains, the paper aims to explore how Filipino au pairs in Norway and their left-behind families

experience being part of the scheme and what consequences this participation has for the involved parts. The mobile multi-sited approach allows also exploring how the left-behind family members perceive of and experience being part of the global care chains. The perspective of the mobile migrants as expressed in the interviews is combined with the perspective of their immobile family members to reveal the meanings and mechanisms of migration. A major methodological discussion in the paper revolves around the relevance and applicability of the mobile multi-sited approach in the sociological study of transnational au pair-migration.

### “I Don’t Know Where I’m Going”: Using Go-Along Interviews When Discussing Neighbourhood Change with Young People in Two Deprived Neighbourhoods in Glasgow, UK

Joanne Neary, MRC | CSO Social and Public Health Sciences Unit, Glasgow | [jneary@sphsu.mrc.ac.uk](mailto:jneary@sphsu.mrc.ac.uk)

A go-along interview enables the environment of the participant to play an integral part in the interview process- often taking place in the participant’s neighbourhood; the interviewer will accompany the participant on a short walk while asking semi-structured questions relevant to the route (Anderson, 2007). This utilises participants’ own knowledge of the neighbourhood by allowing the context of the neighbourhood to become a dynamic place where landmarks and biographies overlap.

This has been used to some success within childhood and youth studies, as it addresses the power imbalance within the research context (Langevang, 2007) and enabled participants to be seen as experts. My PhD used go-along interviews as part of a longitudinal multi-method qualitative study examining how 15 young people (aged 11-18) experienced regeneration in two deprived neighbourhoods in Glasgow (UK). As the regeneration strategy involved demolition of

buildings, and closure of services, it was assumed that many of the personal landmarks of the young people would have changed. Therefore the go-alongs had two purposes: to ask about their current experience of the neighbourhood, and to ask about their memories of the neighbourhood. This paper

will focus on the experience of conducting the go-along method, and will highlight the methodological considerations of this method; specifically issues surrounding control and power within the interview context, and environmental factors which facilitate or hinder the research process

## Present and Future Practices of Personal Interviewing

**Martin Griesbacher**, University of Graz | [m.griesbacher@uni-graz.at](mailto:m.griesbacher@uni-graz.at)

**Rafael Schögler**, University of Graz | [rafael.schoegler@uni-graz.at](mailto:rafael.schoegler@uni-graz.at)

Technological innovation has brought important changes in the ways of empirical research methods. Today even the most elementary forms of interviewing techniques rely on technical tools (e.g. audio recorders or data analysis software). The Center for Social Research is engaged in making tablet computers available for the needs of personal interviewing. Tablet-Computer-Assisted-Personal-Interviews (TCAPI) offer a wide range of options for interviewers ranging from multimethod designs, multimedia implementation, intuitive handling to gains in efficiency. To develop good technical solutions it is necessary to take into consideration the present practices of personal interviewing. However little empirical data about current practices of qualitative interviewing, the use of interview guides and other tools is available. Using document analysis, qualitative interviews

and a comparative corpus of textbooks we investigate the practice(s) of interviewing. The textbook analysis depicts the ideal interview, strategies to cope with different types of interviews and in more general terms the normative expectations sociologists are to follow when interviewing. Against this background of normative instructions, we interview researchers and analyze their interview guides, which provide first hand empirical data on the layout, organization of questions, memos and room for note-taking etc. We ask how interviews are structured, how dynamic they are and how interview-guides are used. Also, the use of additional material (cards, audio, video, post-interview questionnaire etc.) will be elucidated. With this research of the present practices it is possible to show new ways of technology enhanced personal interviews. (Altern: Innov in qual me)

## Site-Specific Focus Groups: Analyzing Learning Spaces in Loco

**Alexandra Duarte**, ISCTE-IUL, Lisbon | [alexandra.duarte@iscte.pt](mailto:alexandra.duarte@iscte.pt)

**Luísa Veloso**, ISCTE-IUL, Lisbon | [luisa.veloso@iscte.pt](mailto:luisa.veloso@iscte.pt)

**Joana Marques**, ISCTE-IUL, Lisbon | [joana.marques@iscte.pt](mailto:joana.marques@iscte.pt)

This paper reflects on site-specific focus group as a research technique used in a study on the Portuguese Secondary Schools Modernization Program. The analysis of the impact of the renovation of school buildings in learning practices is a central objective of the research,

and given the complexity of the study, we mobilized a methodology which includes different techniques: document analysis, interviews, and questionnaires. Subsequently we initiated a process of collective reflection on the impact of the interventions by

conducting site-specific focus groups with pupils and teachers, a process that involved the interaction in the classroom (focus groups, in the classical sense) with a commented visit to the school, totally guided by teachers and pupils. Focus groups were particularly important for research because it generate a dynamic social interaction between people and physical space, leading to an in loco confrontation of opinions and perceptions about the impact of renovation of the spaces in learning models and in the processes of appropriation of physical spaces by social actors. Despite the growing use of focus

groups in the social sciences, the major innovation of this study is the fact that the focus group takes place before, during and after visiting the school, which enabled a physical contextualized data recording about the spaces and its relation with learning practices. Empirically it was found that the combination of these techniques enhanced the research in the identification of critical and positive aspects mentioned about the spaces, in the explanation of the differences between pupils and teachers, as well as in understanding the forms of appropriation of the space.

## **b06RN20 - Visual Analysis**

Chair(s): Bernt Schnettler (University of Bayreuth)

### **Photo-Elicitation Interviews as a Tool to Understand Gendered Ethnic News Coverage: From Media Studies to the Study of the Perception of a Gendered Racism**

Luigi Gariglio, University of Torino | [luigi.gariglio@unito.it](mailto:luigi.gariglio@unito.it)

Populism, ethnocentrism and racism are more or less relevant in different social and political settings and do structure in different ways media production and consumption though out European and non-European countries. Race, ethnicity gender, sexuality have long been addressed, in very different ways, as a contested battleground by media scholars. This article shows the result of a qualitative research based on ethnographic approach and photo elicitation in which 33 women characterized by different ethnicities (Italian, Rumanian, Nigerian) and by different position in Italian society, living in different areas of the country (the polarize sample is composed: on one side of street prostitute and, on the other, of feminists and Catholic nuns) read and describe a group of media images that often represent Italians as sexual bodies and almost always represent "black women" as sex

workers. That images were selected from three mainstream Italian news weekly magazines from the crises period (2008-2012). Taking into account the legacies of the methodology of this project, methodological issues about using visual stimuli in the interview will be addressed and pro and cons discussed with a reflexive approach. Two main finding include: first, a strong colour line among "black" and non "Black" women regarding the topic of racism both in the representation and in everyday life and, second, a less strong "ethnicity line" regarding visual representation of women naked bodies in news magazines. We conclude by stressing the necessity of research in this field and in the necessity of paying more attention both to the visual and media sphere in sociological qualitative research.

## Benefits of Visual Narrative Analysis: Exploring Self-Shooting as a Body - And Self Construction Practice

Katrin Tiidenberg, Tallinn University | [katrin.tiidenberg@gmail.com](mailto:katrin.tiidenberg@gmail.com)

Social media sites are the latest generation of 'mediated publics', they allow people to make sense of the social world, express themselves, make certain acts 'real', etc. The body (like the self) has become a 'site of interaction and appropriation' in late modernity. As the meaning of the body has changed from the 'locus of the soul' to a consumerism reinforced 'unfinished project' its boundaries have altered. One of the ways to witness this, are self-portraits, which now, via camera phones and online sharing, take part in embodiment processes. Self-shooting is becoming ubiquitous with the proliferation of camera phones and popularity of social media sites that ask for profile pictures. One could argue, that understanding self and body construction via self-images sheds light on our grander 'reflexive project of the self'. Hence, the 21st

century sociologist should, when possible, involve bodies, when researching identity; and include image interpretation into one's array of tools (unprompted self-images whenever possible). This paper offers a methodical argument for enhancing one's research with image analysis based on the example of author's two-year (and ongoing) cyber-ethnographic field-, and interview research with 'not suitable for work' bloggers and self-shooters on tumblr.com. In particular it argues for the suitability of the less often used visual narrative analysis (which combines the analysis of images, captions, comments with the pre-existing interview and field note material) as it allows a 'critical approach' to interpreting images, is sensitive to their constructed nature while 'taking images seriously'.

## Between Image and Practice: Methodological Challenges for Computer Assisted Qualitative Data Analysis (CAQDA) in Poland

Anna M. Kordasiewicz, University of Warsaw | [anna.kordasiewicz@gmail.com](mailto:anna.kordasiewicz@gmail.com)

Karol Haratyk, University of Warsaw | [karolharatyk@gmail.com](mailto:karolharatyk@gmail.com)

Since the beginning in the '80 there were reservations toward CAQDAS among qualitative researchers (e.g. Seale 2000: 154-5). Currently in Poland their use is more common, but not universal and the reservations remained. Taking this into consideration the Polish literature of the subject engages in continuous CAQDAS legitimizing practices instead of offering critics of the CAQDAS' capabilities. The legitimizing strategies consist mainly of 1) exploiting the grounded theory (GT) approach to theoretically support the CAQDA and creating the image of an analytical "magic wand", and 2) each time providing introductory detailed descriptions of software procedures which impedes the

papers to develop beyond this basic description. Our paper is based on the pioneer meta-methodological mixed method research on practice and opinions of Polish researchers on qualitative analysis and especially computer assisted analysis. Our results include the diagnosis of a dual gap within Polish sociology in the area of CAQDAS. First one is between image of CAQDAS in the methodological literature and in the opinion of the researchers themselves. Second gap is between the image among the users and actual practices of the software use. There is also inconsistency between opinions commonly repeated in the methodological literature about close links between CAQDAS and GT and the lack of

functions essential for the analysis inspired/required by the GT in CAQDAS. By presenting our paper we would like to inspire an exchange between qualitative scholars

across Europe to develop a methodology of qualitative research, including CAQDA methodology.

## **Video Ethnography in a Glocal Context. From Genoa to Dakar**

Luciana L.T. Taddei, University of Genoa | [taddei.luciana@gmail.com](mailto:taddei.luciana@gmail.com)

It is very difficult to represent the complexity in physical spaces. The paper discusses the possibility to include video ethnography as a useful method to study social issues. The researcher, in fact, through visual methods, has the possibility to show natural setting and also to transmit strong emotions that are the basis of social reality. Visual approach became fundamental in the century of technology and communication. To improve this method we have worked with an antiracist group that is fighting for the regularization of peddlers in Genoa, Italy. This group is self-organized by immigrants, and the majority of them is sans-papier and come from Senegal. The video is recorded both in Italy and in Senegal and try to explain to Italian citizens that also these guys

are "persons". Understand this concept is really important because sans-papiers are strongly criminalized by Italian government, laws and media, and it is fundamental to change the public opinion. Working with this organization and the families in Senegal was fascinating but also really difficult: problem for who and how film, where reproducing video, agree upon what message we want to transmit, etc. The paper will discuss how a method like video is able to capture the complexity of urban spaces and can transmit, better than other methods, emotions and feelings, to bring people closer to "Others". Potentially, video is a tool that has this capacity and it could be able to make debate and to modify public opinion, at least at local level.

## **07\_20JS28 - Sport and the Visual: New Developments and Opportunities**

Chair(s): Roger Penn (Queen's University, Belfast), Ajit Singh (University of Bielefeld)

### **Visualization of Knowledge and Embodiment within Coach-Athlete-Interaction**

Ajit Singh, University of Bielefeld | [ajit.singh@uni-bielefeld.de](mailto:ajit.singh@uni-bielefeld.de)

Sport as a specialized environment of embodied practices seems to be predestined as a laboratory for observing and analyzing processes, where the use and visibility of bodies is an essential part of communication and social action. The case of trampoline jumping, in the context of young competitive sport, will be analyzed using video-based data of recorded training situations on the coach-athlete-interaction. Already Bateson and Mead (1942) in their study on Balinese culture

pointed out, that methods of teaching and learning are not only verbal but also visual, embodied and kinaesthetic. Also Goffman stressed the expressive quality and meaning of the body ('display') in everyday life, focusing on the analysis of face-to-face-interactions in social situations. Referring to these considerations, I want to discuss the constitutional role of physical representation and visualization as a relevant practice of conveying embodied knowledge in coach-

athlete-interaction. Therefore firstly, various forms of multimodal instructions of “skills” (Schütz) and “techniques of the body” (Mauss) in the institutionally embedded coach-athlete-interaction are reconstructed. Secondly, I will show how in practices like demonstration, imitation and adaption, a sport specific identity is formed. ‘Doing being’ the ‘trampoline

jumper’ is bodily and intersubjectively constructed based on physical visualization and performative habitualization. Finally and thirdly, it seems necessary to reflect methodologically the possibilities and limits of videographic fieldwork and the use of visual data for a deeper understanding of embodied and communicative action in sport.

## Visualization of Visual Data - The Problem of Transcripts and the Play with Purity and Persuasion

Maud C. Hietzge, PH Freiburg | [hietzge@ph-freiburg.de](mailto:hietzge@ph-freiburg.de)

The paper is a methodological one. It starts with a short overview on recent developments of videographic data analysis of very different kinds (Streeck, Bohnsack, Knoblauch, Moritz, Loer etc.). Bodily interaction needs video documentation to analyse it more closely - this has always been clear in motion and game analysis, but seems to cause trouble in (sport) sociology. The results will be reviewed systematically in comparison to other paradigms, we get an idea, what would be missing without videographic research. Using different examples of videography (the close analysis of an extraordinary play activity of girls, Parkour videos, and boxing films) it will be shown how one can do visual research on different levels: the interaction in front of the

camera, the self-mediatization of youth cultures, and the intentional aesthetics of the body in film (Hietzge 2010, 2011, 2013). The argument is clear concerning the necessity to use visual data and to overcome the gap between ethnography and hermeneutics on one hand and ‘scientistic’ approaches (Hitzler) on the other. The interplay of numerical and visual data will be shown to work together. Videographic interaction analysis allows new evidence for bodily processes of subjectivation (Alkemeyer). The bodily reaction on other bodies action shows meaningful processes inspite of there tacit character (Polanyi). Videography is a means to unravel unconscious aspects of practices in the double perspective of simultaneity and sequentiality.

## Ethical, Legal and Practical Issues in the Use of Visual Data within Sociology

Roger Penn, Queen's University, Belfast | [r.penn@qub.ac.uk](mailto:r.penn@qub.ac.uk)

Damon M Berridge, Lancaster University | [d.berridge@lancaster.ac.uk](mailto:d.berridge@lancaster.ac.uk)

The paper will examine the legal, ethical and practical issues that surround the use of visual materials in contemporary sociological discourse and practice. The paper will explore the vexed question of the legality of taking photographs and videotext as part of any empirical sociological project. The analysis will assess both current legal constraints and - more pertinently - contemporary views about what these laws constrain and restrict. These

issues will be analysed within a comparative European perspective. Examples will be drawn from the authors' research on football in England and Italy. The paper will also explore the debate surrounding the ethics and norms of photographic practice within sociology. This will focus on the issue of ‘consent’ and the conditions under which ethical approval of research is needed. The paper will propose a set of protocols that should be used in any

sociological analysis that incorporates visual materials. The paper will also explore the practicalities of producing visual material and of publishing analyses that incorporate such

data. These include difficulties surrounding the use of colour photographs and of presenting videotext evidence within conventional academic sociological outlets.

## The OZ Project: Observing Attention

**Roberta Ferrario**, Institute of Cognitive Science and Technology, Italian National Council of Researches - CNR, Rome | [roberta.ferrario@loa.istc.cnr.it](mailto:roberta.ferrario@loa.istc.cnr.it)

**Chiara Bassetti**, Italian National Council of Researches - CNR, Rome | [chiara.bassetti@loa.istc.cnr.it](mailto:chiara.bassetti@loa.istc.cnr.it)

**Marco Cristani**, University of Verona | [marco.cristani@univr.it](mailto:marco.cristani@univr.it)

**Francesco Setti**, CNR - Italian National Research Council, Rome | [francesco.setti@loa.istc.cnr.it](mailto:francesco.setti@loa.istc.cnr.it)

Understanding whether an event has attracted the audience attention and singling out the moments that have been mostly enjoyable is a primary goal for those who manage sport and show business, in order to ameliorate presentation strategies, logistic aspects, and the like of an event. So far, such activities have been based on data concerning the sold tickets and ex-post polls. OZ is an interdisciplinary, mixed-methods project that we propose for a methodological discussion. It aims at developing a technology able to automatically detect at run time if and how intensely attention is captured, via the use of models integrating computer vision and ontology. The ontological model will be built based on a sociological analysis of the audience's behavior. Leveraging on cheap and not invasive

sensors (cameras, microphones) directed towards the audience (whose privacy will be seriously taken into account), the result of the project should be an algorithm able to classify the public attention on a scale from 1 to 10 in a continuous way all throughout the sport event. The project's case study is the Trentino Winter Universiade (December 2013). Research activities are organized in: an evaluation phase antecedent to the event, in which sensors will be installed, ethnographic observation conducted, and the algorithm progressively refined and tested; an execution phase, in which the level of audience's attention will be measured; an evaluation phase, in which the performance of the algorithm will be finally compared with the results of an a-posteriori survey.

## a07RN20 - Videography and Video Analysis

Chair(s): Bernt Schnettler (University of Bayreuth)

### The Study of Social Interactions in Meal Practices of Young Adults: Assets and Limits of Video Data

Giada Danesi, EHESS, Paris | [danesi.giada@gmail.com](mailto:danesi.giada@gmail.com)

This communication focuses on the video data collected in a research dealing with eating practices and representations among young adults in three European Countries (France, Germany and Spain). We were interested in better understanding how young adults gather together to share meals and highlighting how food sharing contributes in establishing social ties, building social belonging and collective identity. We choose to work with complementary methods (in-depth interviews, participant observations and video recording of meals in a restaurant) in order to collect discourses on one hand, and usages on the other. Video data were collected in a restaurant already equipped with 6 cameras in the ceiling where different groups of young adults came to have lunch or dinner. The

equipment allows us to record single tables from different perspectives. In this way, it has been possible to see the front of every person eating around the table. Moreover, one camera recorded the entire room. This allows us to have a view of the general context and to better understand the behaviours of the commensals when they were looking or commenting something happens off-camera, such as the waiter or the people sit at another table. In this paper, we would like to discuss the reflections we carried out and the difficulties we met in the use of this method at the different steps of the research: the choice of this method, of the social situations to record, the recording, the type and the tools of analysis and the challenges in traducing this type of data in a text.

### Video Hermeneutics: Conceptualizing Social Relations between Objects as Well as Bodies

Ulrike Tikvah Kissmann, Catholic University of Eichstätt-Ingolstadt | [ulrike.kissmann@ku.de](mailto:ulrike.kissmann@ku.de)

The author has developed an approach to video hermeneutics which draws upon Maurice Merleau-Ponty's concept of "intercorporeity". It provides the theoretical framework for considering social relationships between objects as well as between bodies, and it goes beyond traditional notions of intentionality. In contrast to the Weberian approach, for example, which relates intentionality to consciousness and subjectivity, the author argues that gestures and facial expressions

are understandable on a supra-individual and preconscious level. Merleau-Ponty's distinction between "gestural" and "notional" meaning is presented as a precondition for analysing video data from a pre-iconographic perspective on the one hand, and an iconographic perspective on the other, as developed by Erwin Panofsky. Well known gestural meanings can be found in, for example, the movement of head banging, or the facial expression that constitutes "the caring look". The author argues that within

different cultures, or *gemeinschaften*, gestural meanings can be interpreted differently. Against this background, it makes sense to consider certain gestural meanings as being objective within a certain culture or

*gemeinschaft*. The author suggests that these objective meanings are internalized by every child as part of Thomas Luckmann's "socio-historical apriori".

## **An Ethnography of Synchronized Swimming: How to Video Capture Creativity in Sports**

**Dafne Muntanyola**, Autonomous University of Barcelona | [dafne.muntanyola@uab.cat](mailto:dafne.muntanyola@uab.cat)

**Carlos Lozares**, Autonomous University of Barcelona | [carlos.lozares@uab.cat](mailto:carlos.lozares@uab.cat)

**Anna Estany**, Autonomous University of Barcelona | [anna.estany@uab.cat](mailto:anna.estany@uab.cat)

We present here a new video capture methodology applied to the context of synchronized swimming. Its specificity as a competitive sport comes from the need to work with social bodies in an extremely constrained environment, that of underwater, dealing with the swimmers' physicality, skills and emotions. In this paper we address the interactive patterns of the Spanish Olympic team through a video-aided ethnographic work, which included observation and interviewing. Systematic audiovisual analysis required a detailed knowledge of the observational field through note taking and video capture for 3 months in 2012. We considered the trainers as well as the swimmers' experts in their domains. In order not to get lost with the data, we classified Activity Recurrent Episodes between the trainers and the synchronized swimmers. To code and analyze the video we

used ELAN® developed by the Max Planck Institute for Psycholinguistics, for small-scale interactions. We classified the type of interactions and sorted through the channels of communication that lead to the production and selection of choreographies. As preliminary results, their interactions included cognitive processes that were empirically embodied, situated and distributed. The communication process between the trainers and the synchronized swimmers seems to be shaped by environmental elements such as the music and the water. Plus, there is shared awareness among synchronized swimming professionals of the emotional implication of their interactions. Video-aided ethnography allows to understand synchronized swimming as a sports based on expert social patterns of interaction and creativity.

## **b07RN20 - Narrating Crisis and Change**

Chair(s): Jan Coetzee (University of the Free State, Bloemfontein, South Africa)

### **The Poor and the Powerless amidst Crisis and Change: Narratives of Serfdom**

**Jan K Coetzee**, University of the Free State, Bloemfontein | [coetzeejk@ufs.ac.za](mailto:coetzeejk@ufs.ac.za)

Almost 20 years into democracy and South Africa remains a highly unequal society.

Although economic inequality is to a lesser extent based on race, race remains an

important predictor of poverty. For some time now a large proportion of black share-croppers and labourers have been pushed off white-owned agricultural land so that ever-smaller groups of black families live permanently on white-owned farms. Amendments to the 'security of tenure' acts/laws strengthened the rights of workers occupying housing provided by farmers. Nonetheless a strong degree of paternalism persists in the relationship between some farmers and 'their' farm workers. In many parts of the former apartheid state, generations of black farm workers, born on a specific farm, spent their entire working life there. Most would eventually die on 'their' home farm never experiencing another life

outside of it. Their lives resemble a form of serfdom. They occupy a fixed social status which prevents them changing the conditions of their existence: a social status underwritten by custom and agreement. On some farms relations of absolute dependency continue to exist. This paper firstly attempts to structure the narratives of serfdom and to document aspects of individual and social memory. It sets out to un-wrap the aspirations and frustrations of the powerless and to illustrate the dehumanising effects of a lack of participation over time. It thirdly trusts to contribute to the broader discourse on the effects of crisis and change in contemporary society.

## Researching Lived Experience among Young People in Detention Homes: An Experience-Centred Approach to Narrative

Zulmir Becevic, Linköping University | [zulmir.becevic@liu.se](mailto:zulmir.becevic@liu.se)

In the Swedish context the notion of young people in detention homes has for long been associated with various societal as well as individual problems; psychological-, family- and addiction problems to name a few. As a result, this particular category of adolescents is often understood and described as being "deviant" per se, in research as well as in public discourse. This is due to the fact that most of the research within this field focuses on mapping and investigating underlying factors (criminality, segregation, poverty, dysfunctional childhood) that are characteristic for this group of young people, omitting the subjective meaning of the lived experience these young people give to their existence. Aiming at understanding the lived experience as it is expressed through life narratives, this paper puts forward a methodological approach

that primarily focuses on the voices and perspectives of the subjects themselves. The methodology is grounded in a constructivist theoretical framework drawing on the works of Jerome Bruner and Paul Ricoeur and their ideas about the intertwined concepts of (lived) experience, narrative and narrative identity. This approach also rests on the assumption that experience is created in (and becomes a part of) consciousness when people process events from the lived life. Experience is understood as a personal phenomenon that is characterized by subjectivity and change, expressed through the mode of narration. The methodological approach will be further explicated through a presentation of "narratives of experience" that were collected through life story interviews with institutionalized adolescents.

## Where to, Where from? The Narrative Construction of Social Spaces in Migration

Alexandra G.I. Deliu, University of Bucharest | [alexandradeliu@yahoo.com](mailto:alexandradeliu@yahoo.com)

The recent history of Romania makes it an emigration country, as there are a vast number of Romanian citizens who adopt a transnational life strategy. Numerous studies focus on the determinants of the Romanian migration, its effects on the sending regions and localities, as well as on the future shape of migration trends, in order to determine migrants' orientations or preferences. The perspective from which I choose to study migration provides different openings, as I pay attention to the construction of narratives in relation to migration experiences. My work is based on field research carried in the summer of 2012. My analysis is situated at the confluence of migration studies and narrative analysis: the empirical material consists of transcripts of conversations between sociological

interviewers and individuals with migration experiences, in a village situated in the East-central part of the country. I highlight and discuss types of narratives in accounts of migrants' experiences, and their reliance on discursive resources in order to make sense, in talk-in-interaction, of origin and destination and the itineraries that link them. The two social spaces are present in migrants' narratives in different ways, and they imply the use of distinct discursive resources. Often built as opposites, the local community from Romania (the village), on one hand, and Italy as a whole, on the other, are the migrants' correspondents of researcher's concepts of 'origin' and 'destination'. Indicated area: Qualitative research on migration

## 'Unlike my Brother I Managed to Adapt Well to the New Times' - Narrating Transformation in Poland

Ina Alber, Herder Institute for Historical Research on East Central Europe -  $\frac{3}{8}$  Institute of the Leibniz Association | [ina.alber@herder-institut.de](mailto:ina.alber@herder-institut.de)

Crisis and change are fundamental parts of the Polish discourse on transformation and democratisation after 1989. Formerly well-established patterns of acting and interpretation had to be transformed and adapted to the new political and economic circumstances. While doing research on Polish civil society activists I have found narrations of crisis and change not only in my biographical-narrative interviews but also in various forms on the internet (web 2.0). The combination of different sources in which people tell and/or write about their experiences proved very fruitful. In my approach using discourse analysis and biographical research in the tradition of sociology of knowledge narrations can be analysed in different sorts of material. It can be reconstructed in this case that the

discourse in Poland is dominated by the figure of the 'winners' on the one hand side and the 'losers' on the other hand side. In my sample of civil society activists the interviewees present themselves as 'winners', who used their abilities and qualifications in order to master crisis and change. In my paper I want to reconstruct the patterns of interpretation they use in order to construct themselves as 'winners', e.g. by comparison to the 'losers' or by stressing the importance of their engagement for societal change. In general, I want to show how crisis and change are constructed and re-constructed through narration. Besides I would also like to discuss the challenges and opportunities of triangulating different sources of empirical material like interviews and internet posts.

## Biographical Work of Young People in Transition - An Individualised Crisis?

Sina Mareen Koehler, Gottfried Wilhelm Leibniz University of Hanover | [sina-mareen.koehler@iuew.phil.uni-hannover.de](mailto:sina-mareen.koehler@iuew.phil.uni-hannover.de)

A longitudinal qualitative study of youth with different school careers and backgrounds during transition to vocational or academic education system will be presented. Initially, the presentation will give an insight of the empirical design of the longitudinal study. Taking the stance of the praxeological sociology of knowledge I used the documentary method to reconstruct different kinds of habitus formations. In a first phase the study explores the concepts and views of students and their teachers. The second and third phase of the study will consist of qualitative interviews with the same young adults and their instructors or lectures. The data of the first phase consists of 30 qualitative interviews with students and 18 qualitative interviews with

teachers. The forthcoming results will show the fields the teenagers are going to enter after school and the development of their concepts and views after transition. It is necessary to find out more about the connection between labour market crisis and individual crisis. Furthermore, the presentation will discuss how the methodological perspective of reconstructive school research can provide a deeper knowledge of students' world. The findings could prove useful for improving vocational orientation programs at schools. Currently, such programs are disconnected from students' everyday life and display little attention for their individual experiences.

## a08RN20 - Online Research

Chair(s): Giampietro Gobo (University of Milano)

## Researching Virtual Realities -- Methodological and Conceptual Issues

Robert Miller, Queen's University, Belfast | [r.miller@qub.ac.uk](mailto:r.miller@qub.ac.uk)

The first decades of the century have seen profound transformations of societies through digital media. One effect of these new means of contact is that virtual identity does not necessarily correspond to corporeal identity and can become divorced from it or deliberately masked (with sometimes criminal sinister results; such as sexual predation via the internet). An extreme manifestation is the creation of 'virtual worlds' populated by 'avatars', alternate online identities. For many, the opportunity to take on an alternate identity in a 'virtual world' is its primary attraction. Biological constraints, from being plain or unattractive through being too old or the wrong

gender to having a physical handicap, can be transcended. Arguably, moral constraints need not apply either. While not 'real' in the physical sense, virtual worlds can be very real in their effects and are independently evolving societies. They have economies that interact with economies in the 'real world' and it is possible to make a living or become rich in the real world through your activities in a virtual world. Even in their present, rudimentary form, some persons prefer their virtual identities and lives to those in their 'first lives'. Driven by strong economic and technological imperatives, human/computer interfaces and virtual realities will become radically more

immersive in the near future. It is not hyperbole to speculate that this could have profound effects for what it means to be human and social in the 21st century. This paper will explore some of the myriad issues –

ethical, methodological and practical – that arise from conducting research in virtual worlds and attempt to discuss how virtual realities can be theorised.

## Qualitative Methods and On-Line Research. A Case of Patients' Blogs on Radical Therapy for Acute Leukemia

**Mateusz Stopa**, University of Information Technology and Management, Rzeszow | [mateuszstopa@gmail.com](mailto:mateuszstopa@gmail.com)

**Dariusz Wojakowski**, AGH University of Science and Technology, Cracow | [darekwojak@wp.pl](mailto:darekwojak@wp.pl)

**Marek Dudziński**, Voivodship Specialized Hospital, Lublin | [marekdudzi@gmail.com](mailto:marekdudzi@gmail.com)

The presentation contains theoretical, methodological and empirical reflections on possibilities of using on-line sources for recognition of social and cultural conditions of behaviour of patients treated with radical therapy for acute leukemia. Theoretical basis are symbolic interactionism (Thomas, Znaniecki, Blumer) and some assumptions within grounded theory (Glaser, Strauss, Chamraz). From accepted sociological perspective medical treatment is interaction process, therefore understanding components of this process including perspective of the

patient and their relatives is crucial for analysis of relations between patient, medical staff and third parties and effectiveness of the treatment. Posts on blogs and vlogs might be considered as qualitative data for e.g. Health History Calendar, however within mixed methods paradigm. Analysis conducted with Atlas.ti show multidimensional information inside each blog treated as personal document (Thomas, Znaniecki) but with some important differences, especially actual interaction between author and readers.

## Content Analysis of Weblogs in the Migration Research

**Katarzyna Andrejuk**, Polish Academy of Sciences, Warsaw | [katarzyna.andrejuk@gmail.com](mailto:katarzyna.andrejuk@gmail.com)

The increasing popularity of netnography is a result of easy access to the research data and variety of social activities which can be examined using this method. Qualitative content analysis of weblogs (blogs) is a significant part of Internet-based ethnography. This research technique can be seen as a continuation of analysis of personal notes and "diaries" which has been used in the classical research about the unemployed of Marienthal by M. Jahoda, P. Lazarsfeld and H. Zeisel (1933). In case of migration research, analysis of blogs simplifies and accelerates gathering the data about people on different stages of migratory process (preparing to migration,

living in the host country, returning to the sending country or migrating to third countries). In the presentation I will describe the example of my qualitative study about Polish students at British universities after Poland's accession to the EU. I will examine the usefulness of content analysis of blogs in the migration research, its comparability with other qualitative methods (the study used two main methods: blog content analysis and structured interviews) and key limitations of this method. The presentation will describe techniques of self-presentation and subjective perspectives on individual biographies which are presented in blogs.

## b08RN20 - Emotions in Qualitative Research II

Chair(s): David Wästerfors (Lund University, Sweden)

### 'We Are not Paedophiles': Recognizing and Managing Emotions in the Fieldwork

Morena Tartari, University of Padova | [morena.tartari@unipd.it](mailto:morena.tartari@unipd.it)

This paper focuses on some methodological issues emerged by the ethnographic study of an Italian local community where a sensational case of ritual child abuse happened in a nursery school. The study was realized in the frame of Grounded Theory with the use of sensitizing concepts (Blumer 1969). An interpretation of the case grown up is compatible with the moral panic theory (Cohen 1972; Critcher 2003, 2009; de Young 2004). The conflicts between parents, teachers, inhabitants, media and several institutions at a local level, and between criminal justice system and different professional approaches to the assessment of child abuse at a national level distinguished the field. In this paper I discuss the role of ethnographer's emotions and identity negotiation in gaining access, constructing and maintaining trust

relationships with the social actors involved in the case. The construction of the fieldwork situation pertains the ethnographer's emotions and identities and needs an objectification of the researcher as suggested by Bourdieu (2003). In particular I focus on the ethnographer's need to recognize and manage her/his own emotions when they concern moral dilemmas and moral identity in order to prevent inappropriate emotional responses or fieldwork stresses. In conclusion, it is necessary to recognize and analyze the amount of emotional work in the field (e.g., Holland 2007, Sampson et al. 2008): such research process constitutes an ethical responsibility of the ethnographer and provides important findings of the research that require to be interpreted as well as other data.

### Emotions, the Ethnographic Self and Performance of Classed Masculinity

Elias le Grand, Stockholm University | [elias.legrand@sociology.su.se](mailto:elias.legrand@sociology.su.se)

Recent years have seen a dramatic increase in reflexive or 'first-person' accounts in ethnographic research. In sociology such work has also started to appear in mainstream journals (e.g. Sociological Quarterly, Sociological Research Online and Sociology). Contributing to this reflexive turn in ethnographic research, the present paper discusses how an analysis of the researcher's emotions, identity-work as well as the roles in which she is positioned during fieldwork, can inform our understanding of how class and masculinity are performed in the field. In so doing, the paper draws on the author's experiences of long-term ethnographic fieldwork of white working-class youths

residing in a deprived area located on the outskirts of South London, in which he lived and also worked as a youth worker. The paper shows that codes of interpersonal behaviour, particularly apparent among young men in the area, were tied to issues of respect, deference and the display of a 'tough' front. The researcher analyses his experiences, including his emotions, thoughts and behaviour, of being a middle-class and male researcher in this space. He also examines how he was perceived by the young men in the area. In particular, the paper discusses at length an incident involving the researcher and a young man. The paper shows how the researcher's behaviour was coded as effeminate and 'posh', and thus failed

to perform according to the codes of masculinity prevalent in the area. Yet it also shows how he gradually appropriated such masculine codes during fieldwork. In

conclusion, the paper demonstrates the importance of analysing the ethnographic self for understanding the role of class and masculinity during fieldwork.

## **The Continuous Negotiation of Access: Emotion Work and Strategic Emotions in the Field**

**Åsa Wettergren**, University of Gothenburg | [asa.wettergren@gu.se](mailto:asa.wettergren@gu.se)

**Stina Bergman Blix**, Stockholm University | [stina.bergmanblix@sociology.su.se](mailto:stina.bergmanblix@sociology.su.se)

Gaining access to the field is a process of continuous negotiation between researcher and participants, with no guarantee for stable once-and-for-all admittance. In ethnographic research the researcher uses herself, 'body and soul', as a tool in the data gathering process. However, few scholars have highlighted the emotion work inherent to access negotiation. Analyzing field diaries from an ongoing project about emotions in court, we aim to address this blind spot in reflexive qualitative research. Strategic other-oriented emotion work pertains to the building up and preservation of participants' motivation and trust. Introspective self-oriented emotion work is needed to uphold the balance between proximity and distance; to understand why

ruptures in access occur and how to repair them; and to manage strong emotions emanating from experiences of exclusion/inclusion. Unruly emotions of rage, shame, fear, guilt and joy can be difficult to handle, but can also be useful analytical markers of important or vulnerable aspects of the phenomena under investigation. While in everyday life people construct a coherent identity through managing the impression of self-consistency between interactions, a researcher's effective role expressions adapt to every new respondent in an effort to make her feel comfortable. This may compromise the impression of self-consistency, and thus authenticity, when more than one respondent has to be tended to at a time.

## **Black, White and In-Between: Affective and Emotional Facets of Performing Diversity in 'Tiny Publics'**

**Florian Elliker**, University of the Free State, Bloemfontein | [ellikerf@ufs.ac.za](mailto:ellikerf@ufs.ac.za)

**Jan K Coetzee**, University of the Free State, Bloemfontein | [coetzeejk@ufs.ac.za](mailto:coetzeejk@ufs.ac.za)

**Conrad Kotze**, University of the Free State, Bloemfontein | [pckotze@yahoo.com](mailto:pckotze@yahoo.com)

The paper is concerned with the affective and emotional facets of belonging to, living in and relationally identifying with groups on the campus of a historically white South African university. It focuses on the transformation of student residences, initiated by institutional efforts aimed at increasing the 'racial' diversity. The corresponding population categories, however, intersect with a 'hinterland' of other relational and categorical

identifications and self-understandings, the inclusion or exclusion of which in/from the explicitly acknowledged notion of diversity is negotiated locally within the 'tiny publics' (cf. Fine & Harrington) and established idiocultures of the groups. These groups are not understood to be 'generic' interaction vessels, but spaces for the creation of shared meaning and collective action that are connected to local traditions and histories.

Three facets will be analysed: a) What are the affective and emotional dimensions of becoming a member of and identifying with the group? b) What are the affective and emotional qualities at stake when the group culture and the corresponding identifications (are about to) change? c) How do students negotiate intersecting but conflicting identifications and self-understandings: What is at stake for

individuals to (openly) deviate from or comply with cultural expectations of the group? The paper explores these issues through narrative interviews with students living in residences on the university campus. The narratives will be read in context of the students' socio-cultural backgrounds, as these have historically been influential in shaping the group cultures.

## 09\_20JS21JS28 - Doing Social Research on Sports. Methodological and Empirical Challenges (1)

Chair(s): Alessandro Porrovecchio (University of Torino), Ajit Singh (University of Bielefeld), Katarina Jacobsson (Lund University)

### Climbing Walls, Making Bridges: Innovative Methodologies, Embodied Identities, Space & the Cultural Politics of Capoeira

Michael L Silk, University of Bath | [m.silk@bath.ac.uk](mailto:m.silk@bath.ac.uk)

Nicola De Martini Ugolotti, University of Bath | [nicola.demartiniugolotti@gmail.com](mailto:nicola.demartiniugolotti@gmail.com)

Ceri Brown, University of Bath | [C.L.Brown@bath.ac.uk](mailto:C.L.Brown@bath.ac.uk)

In this paper we explore the ontological, epistemological, axiological and methodological contingencies at the intersections of identity politics, physicality, embodiment and space. As a lens through which to consider the researcher/researched body, we focus on our on-going work that addresses the processes by which (marginalized) migrant young people navigate spaces of inclusion and exclusion within the multiple materialities and discursive narratives of urban space. This work centres on the performative body practices of young men between 13 and 20 engaging in capoeira and parkour as it articulates with notions of citizenship, identity, visibility, and the recognition of young geographically transitory people in Italian public life. Addressing identities that are put 'to work' towards a sense of belonging and self worth, we explore

the messiness of reflexivity and empirical vulnerability as we engage the body in redefining the boundaries of knowledge production, performativity, and physicality: a project that we see as productive for the future potentialities of the 'sociology of sport'. We advocate for research that centralises corporeal movement and which is suggestive of an innovative approach that elicits or allows for a fuller exposition of the cultures of the body that are being experienced (Giardina & Newman, 2011). Such an approach is one that can destabilize taken for granted forms of knowledge, makes salient the discursive currents of gender, race, class, ethnicity, religion that converge and permeate cultural spaces/sites, and that ultimately can aid in unlocking the processes of identity construction for migrant young people within spaces of inclusion / exclusion.

## Crisis in Body- A Qualitative Insight into a Process of Physical Therapy.

Dominika Byczkowska, University of Lodz | [dominikita@wp.pl](mailto:dominikita@wp.pl)

In the paper there will be presented an outcome of a study on social aspects of embodiment, concerning body in crises after serious bodily change such as an accident, stroke or during a course of other illnesses. The crises may take various forms- physical crisis, crisis of self identification, crisis in interactions with close ones, serious changes in everyday life and many other. The process of physical therapy is used as a mean to regain lost skills (e.g. everyday skills, interactional skills); to rebuild lost identities; to become as independent as possible. The general aim of this process is to get back the life that one had before the crisis, as well as possible. The paper discusses also ways of coping and not coping with the crises, ways of reconstructing

what was lost in an individual's life, as well as emotions and feelings that appear (like fear or disappointment) or that are no longer present (like self-acceptance, pride) during the crises. The process of physical therapy will be presented in context of Polish medical care system. In the study there have been used an autoethnography, interview and participant observation as main research methods. I will also compare some of the conclusions with my former study which showed a way of using one's body as a tool of building a dancer's career. In the paper I will set an important question of subjective and emotional commitment of a researcher to a subject of research.

## Sex Equity in Sports Media: An Invitation to Open a Methodological Discussion

Nicolas Delorme, University Bordeaux Segalen | [nico\\_delorme@hotmail.com](mailto:nico_delorme@hotmail.com)

In the last decades, the media coverage of sport in relation to participants' sex has been extensively analysed in the scientific literature. As one of the most covered international sport competitions, the Olympic Games provide an interesting database for studies investigating differences in journalistic treatment according to athletes' sex. The majority of these studies concluded that women were underrepresented in the media coverage of this event. However, there is an important heterogeneity in how to proceed to determine whether media coverage in relation to athletes' sex is equitable. Therefore, the aims of this study are to determine the most appropriate standards for this comparison and to use them to assess whether there are biases in the journalistic coverage of the Olympics, using data from previous studies ( $n = 18$ ). Equitable media coverage could be measured using a chi-

square goodness-of-fit test in four distinct ways: (a) using the global representation of each sex in the considered Olympics; (b) using the representation of each sex in the considered Olympic team; (c) using the percentage of available events for each sex in the considered Olympics and (d) using the representation of each sex in the number of events for which a given country fields a team/athlete. Results show that media coverage is far from being detrimental to women: they are either equitably represented (28.79%) or significantly overrepresented (46.97%). Indeed, all modalities combined, women are only underrepresented in 22.24% of cases. In most cases, these results significantly differ from those of previous research and stress the importance and the need to take methodological precautions for this type of study.

## Performance in Archery. An Ethnographic Approach to Research the Social Construction of Embodied and Tacit Knowledge in Sports.

Christoph Maeder, Thurgau University of Teacher Education | [christoph.maeder@phtg.ch](mailto:christoph.maeder@phtg.ch)

Archery as an old practice of the humans, which initially was used for hunting and fighting in conflicts, has become domesticated. Nowadays archery is performed mainly as a sport and is even an Olympic discipline. While for the outsider it seems quite obvious what archers do, namely shooting arrows on targets, there is also a more intricate insiders view. In the latter perspective the flying arrow is the product of a complex process of a disciplined body, the use of special artifacts and a correspondingly adapted and specially trained mind. Some of the knowledge to become a successful archer can be expressed verbally. But a lot of the performing competence as a skilled archer can only be gained through

'learning by doing it'. Or "you need to feel it, you need to get the feeling", like some archers say. The production of this feeling refers to embodied and even tacit knowledge necessary to perform in nearly any sport, not only in archery. But how is this feeling socially produced? In my contribution I want to address the question of how we as sociologists can understand, describe and analyze the different forms of knowledge necessary to perform in sports. As an ethnographic case I use the example of archery, where the body, artifacts and the mindset of the performer have to be trained and packed together on different levels: verbally, emotionally and physically.

## a09RN20 - Challenges in Inter-Ethnic and Cross-Cultural Research

Chair(s): Anne Ryen (University of Agder, Kristiansand, Norway), Hanne Halaand (University of Agder, Kristiansand, Norway)

## A Global Ethnography? The Challenges of Conducting Ethnographic Research Transnationally.

Peter H Holley, University of Helsinki | [peter.holley@helsinki.fi](mailto:peter.holley@helsinki.fi)

How might one conduct ethnographic research within a transnational context? In this presentation I discuss the method I have used when conducting ethnographic research that extends beyond the boundaries of the nation-state and across multiple localities. Drawing examples from my doctoral research (a work-in-progress) that studies the identities of present-day migrants both to and from Finland, I discuss the practical challenges I have faced when in the 'field'. These include the challenge of developing and maintaining

research contacts across multiple locales, the limitations of conducting ethnographic fieldwork in multiple research sites, and difficulties in making comparisons between heterogeneous, geographically dispersed groups. In addition to such challenges, I emphasize the advantages of my multi-sited approach: an attempt to develop a cosmopolitan perspective to the study of identities amongst contemporary transnational migrants.

## On Co-Supervising Western Undergraduates in the Bolivian Field: Displaying Assumptions of Hegemonic Power and Reflexivity:

Hanne Haaland , University of Agder | [hanne.haaland@uia.no](mailto:hanne.haaland@uia.no)

Pablo A Regalsky, UMSS, Cochabamba | [regalsky@gmail.com](mailto:regalsky@gmail.com)

Working within the field of development studies and development research, ones framework of understanding is not only influenced by culture and theory, but also by ideas of a hegemonic relationship between the Global South and the North/ West in terms of power. This dimension of power does, perhaps, particularly influence Northern researchers in the South, how we interact with the field and its actors as well as how we interpret our findings, striving to avoid ethnocentrism and generalisations yet often struggling with our interaction with and interpretation of the field. Less attention has been paid to how the same notion of power may have an impact on our interaction and cooperation with fellow academic colleagues from the South. In this paper, based on cross- cultural experiences of co-supervising Norwegian undergraduate students doing ethnographic fieldwork in

Bolivia, we discuss from our respective and different perspectives this particular aspect of research and interaction. How do we as fellow colleagues and academicians representing respectively a North – South dimension observe and interpret the students' struggle with understanding actions or images that are not necessarily culturally shared? To what extent do overarching ideas of hegemonic power relationships, potential ethnocentrism and (lack of reflexivity) impact our supervision of the student's research, our understanding of their projects and our suggestions for the research process? Considering how supervisors and students also can be seen as co-producers of knowledge, we argue that this dimension of the research process, particularly in a cross –cultural context, is one that requires increased attention.

## My Life is Part of It: Articulating the Silenced Work of Female Ethnographers

Hege Wallevik, University of Agder | [hege.wallevik@uia.no](mailto:hege.wallevik@uia.no)

Hanne Haaland , University of Agder | [hanne.haaland@uia.no](mailto:hanne.haaland@uia.no)

Anne - Ryen, University of Agder | [Anne.Ryen@uia.no](mailto:Anne.Ryen@uia.no)

This paper discusses the complexities and quandaries of ethnographic work when aiming at understanding networks and reciprocity in the South. As always, if we are to understand such relationships from within, there is a need, as researchers, also to get involved and to participate in them. Thus, this paper focuses on the level of involvement and the personal implications of this approach. For decades ethnographers have discussed, worried about as well as indulged into, the interactional issues in the field. However, they have also tended not to articulate how the ethnographers' personal life may co-shape the

conduct of research as well as the text. From a feminist perspective we claim that getting immersed also implies challenging the boundaries between the western conception of the private and the public of ethnographic work as reflected in the discussion of contemporary codes of field conduct. We claim that resistances and invitations present stories about the organizations and communities themselves. Drawing on our cross-cultural ethnographic experiences, we argue that ethnographers should articulate these stories as they expose values and interests of the actors, both ties and conflicts. Our focus is with

the first phase when entering the field. We draw on data from our respective projects, - our ways into a small-scale female network for income-generation in Zanzibar Town, the entry

into a larger male Asian business network in East-Africa, and third, the entrance into networks and relationships in a Mozambican village context.

## **Intersectional Analysis – Research Strategies for Studying Change in Heterogeneous Society**

**Tal Meler**, Zefat Academic College | [talmeler12@gmail.com](mailto:talmeler12@gmail.com)

This paper is based on a study I conducted between 2007 and 2011 among Israeli-Palestinian single-mothers. These women are part of a national minority group living in Israeli society. As such they contend with marginality within hegemonic Jewish society and as women living in a patriarchal society. The women experience reality as a simultaneous existence. This simultaneousness stems from living in a space fraught with multiple tensions. Data were gathered by means of in-depth, semi-structured interviews that were conducted and analyzed out of commitment to the principles of feminist research and post-colonial theories. Supervision of the women by their family members emerged as a central theme in the study, but its nature, intensity, and scope were expressed in different ways in each of the women. Since this was a heterogeneous group

of women, the differences between them were also manifested in other variables and underscored the need to conduct intersectional analysis. The intersectional analysis enabled me to expose the repertoire of different voices in the studied field, and accentuate the contexts in which different power structures emerge as meaningful in the women's experiences. Classification of the women according to their economic status, occupation, religion, place of residence, and education, created a typology of three discrete groups. Through the use of the intersectional analysis the findings can illustrate the simultaneous and contradictory trends of change and preservation taking place among women living as a minority in western societies; conservative trends alongside trends of renewal and empowerment.

## **"Heroin Is Like a Swamp (...)" – Methodological Challenges for Studying Drug-Related Concepts and Practices of Russian-Speaking Migrants in Germany**

**Uwe Flick**, Alice Salomon University of Applied Sciences, Berlin | [flick@asfh-berlin.de](mailto:flick@asfh-berlin.de)

**Gundula Röhsch**, Alice Salomon University of Applied Sciences, Berlin | [roehnsch@ash-berlin.eu](mailto:roehnsch@ash-berlin.eu)

Migration can be a (critical) life event that produces many challenges in different areas of life. Due to missing resources for coping with the migration distress, migrants are a vulnerable group. Social support in such a situation often comes from peers using drugs and alcohol. This again intensifies the migrants' health-related vulnerability. Russian-speaking migrants in Germany

consume alcohol and drugs often in very risky way and suffer from diseases like Hepatitis C resulting from their addictions. Do members of this group perceive their substance use as problematic? How are they reached by the health care system, how is their access to it and what are their ideas of effective support? Such questions are pursued in a study with interviewed with around 30 Russian-speaking

migrants. The interviews focus on their illness experiences related to their addiction and hepatitis and on their experiences in the context of utilization of professional help. In the study, we face several methodological problems: First, the language problem – some interviews need to be done in Russian and based on translations and translators. Second, the differences in value systems around drugs and addiction. These differences influence the treatment of the participants' problems in the

health care system. They influence how questions about these issues are filled with meaning in the interview and translation process. Third, in order to understand the gaps between the Russian-speaking participants and the German health care system, which obstruct that they receive adequate treatment, we need to complement their interviews with expert interviews with service providers. Methodologically speaking that calls for a specific form of triangulation.

## 10\_20JS21JS28 - Doing Social Research on Sports. Methodological and Empirical Challenges (2)

Chair(s): Ajit Singh (University of Bielefeld), Alessandro Porrovecchio (University of Torino), Katarina Jacobsson (Lund University)

### Avoiding Social Desirability Bias by Means of Indirect Questioning

Jens Flatau, Christian-Albrechts University of Kiel | [jflatau@email.uni-kiel.de](mailto:jflatau@email.uni-kiel.de)

Frank Schröder, Otto-Friedrich University Bamberg | [schreder.frank@googlemail.com](mailto:schreder.frank@googlemail.com)

**Introduction** Social desirability bias is a long known but so far only rudimentary solved problem in social survey research. On the basis of a real research example, this contribution demonstrates how this bias can be reduced applying the method of indirect questioning. **Research Problem** Voluntary engagement in sport clubs itself is no reason to be embarrassed for. However, altruistic motives for it like the desire to help others are certainly regarded to be more honourable than egoistic ones like the promotion of one's occupational career. Thus, particularly rational egoistic actors can be expected to hide their true intentions and questionnaire surveys on their prevalence are confronted with the social desirability problem. **Method** Fisher (1993) could demonstrate that the social desirability bias can be reduced by indirect questioning. His approach is adapted to the mentioned

research project. Besides direct questioning, two sorts of indirect questions are used regarding similar items representing different kinds of motives for voluntary engagement. Firstly, the interviewees are asked what they think the motives of the other volunteers in the club are. Secondly, they are asked to rate their actually gained utility from their engagement, independent from their intentions. **Results** The study reveals high differences between the corresponding items' values, as expected notably between self- and external attribution. Distinct 'dissonance patterns' can be identified that correlate with socio-economic variables as well as with the temporal extent of the voluntary engagement. **References** Fisher, R (1993). Social Desirability Bias and the Validity of Indirect Questioning. J. of Consumer Research, 20, 2, 303-315

## The Interactive Construction of Sport/Illness Life Histories of Chronically Ill People. An Innovative Approach to Study the Meaning of Sport in Times of Health and Illness.

Mirjam Stuij, Mulier Institute | [m.stuij@mulierinstituut.nl](mailto:m.stuij@mulierinstituut.nl)

Agnes Elling, Mulier Institute | [a.elling@mulierinstituut.nl](mailto:a.elling@mulierinstituut.nl)

People's personal sporting behaviour and attitude towards sport and physical activity are related to one's individual sporting biography and experiences as well as to broader social conditions, perceived expectations and constraints. Influential life events like illness may influence both people's actual and future sporting behaviour and the meanings given to sport and physical activity. Besides an individual process, this is also a cultural and socio-political one, in which patients can accept, negotiate with or resist the most prominent types of success stories ("recovery through sport") as well as the most prominent health discourse ("sport is good for health"). Our study focuses on the (interactive construction of) narratives around sport, physical activity and health of people with a

chronic illness, especially in interaction with their (allied) medical professionals. Therefore, we created a cyclical narrative design where the emphasis is on encounters of different story lines of patients and their professionals. We use a mixed methods design in which we combine surveys among patients, interviews with (allied) medical professionals, sport/illness life histories of patients and ethnographic studies in medical settings. Based on three different pilot studies, this paper introduces our method of collecting sport/illness life histories of patients, with its strengths and weaknesses, and their different contributions to gaining insight in the co-production, negotiation and criticizing of patient's different sporting bodies, identities and practices.

## Exploring the Validity of 'Sport' as a Sociological Concept.

Susan M. Lagaert, Ghent University | [Susan.Lagaert@Ugent.be](mailto:Susan.Lagaert@Ugent.be)

Henk Roose, Ghent University | [henk.roose@ugent.be](mailto:henk.roose@ugent.be)

In this contribution we raise a number of critical issues about how 'sport' is used as a sociological concept in the current quantitative literature on sports participation. We argue that if 'sport' wants to be an adequate and valid concept in sociology, and in the sociology of culture in particular, two related threats need to be considered and overcome: (1) the adequacy of a conceptual definition should be evaluated also in terms of sport activities as being culturally distinguishing practices, and (2) the validity of its measurement in surveys should be evaluated. Often, definitions of 'sport' one-sidedly focus on physical exertion or competitiveness, which neglects the socially distinguishing nature of specific forms of

sports as part of a lifestyle. The phrasing in questionnaires often reflects a specific definition of 'sport', limiting possibilities for analysis. Moreover, it is assumed that 'sport' has an obviously similar meaning to respondents in questionnaires, cf. the wording in the Eurobarometer (2010): 'How often do you exercise or play sport?' Yet, different types of respondents may interpret 'sport' in different ways, undermining the validity of its measurement and hence, its suitability for sound sociological analysis. Using data from the survey 'Cultural participation in Flanders 2009' we focus on some of the undesirable consequences of both threats in sociological research. By applying Multiple

Correspondence Analysis (MCA), we show that people with different sociodemographic backgrounds differ in their understanding of 'sport', implying that the measurement, as it is

used now, lacks validity. Suggestions on how to collect valid data on sport participation are presented.

## **a10RN20 - Archiving and Using Archived Qualitative Data: Dilemmas or Possibilities?**

Chair(s): Anne Ryen (University of Agder, Kristiansand, Norway), Ricca Edmondson (National University of Ireland, Galway)

## **Understanding Effects of Crisis via Historical Qualitative Secondary Analysis (Please Note: 2nd Submission Due to Technical Problems with Email Address)**

Sabine Beckmann, Bremen University | [sabine.beckmann@uni-bremen.de](mailto:sabine.beckmann@uni-bremen.de)

Following the thesis that effects of social change can be studied at the level of subjects' experiences, their norms, values, and discourses, a secondary analysis of qualitative data gains further interest to study social changes and the impact of (modified) social structures on the individual. As a research strategy, qualitative secondary analysis provides multifaceted potential for historical-comparative research designs which combine research data from different points in time. Our paper aims to discuss the potentials, difficulties, and constraints of this research strategy, such as methodological aspects of analyzing foreign data from different studies with different respondents or with (slightly) different analysis methods, but also strategic aspects to highlight historical developments. We will discuss these aspects by presenting results from our DFG-funded research project

IDconstruct. The project is experiencing the method of qualitative secondary analysis for the German scientific community, as this research strategy has hardly been established in Germany. We are analyzing qualitative interviews which had been conducted in four important research projects over a period of more than ten years. Our presented examples derive from two subprojects, both examining elements of capitalist crisis: on the one hand the rising unemployment (a critical side-effect of capitalist economy) and effects of the activation paradigm on unemployed individuals, on the other hand the impact of the raise of the adult worker model on women's subjectification (which is strongly related to the crisis of social reproduction – using a broader notion of crisis as Polanyi does, or, drawing on Polanyi, Nancy Fraser).

## Archiving Qualitative Data. Potentials and Restrictions for Linking, Sharing and Reuse.

Andrea Christine Smioski, University of Vienna | [andrea.smioski@wisdom.at](mailto:andrea.smioski@wisdom.at)

In recent years, much has moved in the discourse on archiving and secondary analysis of qualitative research data. Given high levels of data loss, one-off data usages and a new movement towards more transparent and open means of access to scientific research data, hitherto common handling of research data has become questionable. A culture for archiving and sharing is starting to develop and potential benefits of reusing existing qualitative research material in follow-up projects, re-studies or comparative research have become apparent. At the same time, there are still a number of factors that impede the progress of archival efforts as well as the secondary use of qualitative research material. Challenges reside both on an archival dimension (missing

archiving policies, poorly documented research data, data protection and confidentiality issues) as well as on a methodological level (problems of “data-fit”, using someone else’s data without “having been there”, context sensitivity of qualitative data). Besides pointing out the main possibilities and advantages of re-using qualitative data, this paper addresses methodological problems of doing a secondary analysis project. These considerations lead to a discussion of the prerequisites that are necessary to make someone else’s data not only available but usable. Furthermore measures are suggested by which qualitative data archiving and secondary use can be anchored more profoundly in the social science research community.

## Data Archives and Sensitive Data. Lessons from Evaluation Research and the Boston College Oral Histories.

Aileen O'Carroll, National University of Ireland, Maynooth | [Aileen.OCarroll@nuim.ie](mailto:Aileen.OCarroll@nuim.ie)

Data archives and repositories, especially those dealing with contemporary data, must balance the sharing of data with that of protecting those who the data refers. This paper outlines two case studies. Firstly the experiences of the Irish Qualitative Data Archive in negotiating and developing an archival strategy with for use with data associated with an community based evaluation study. The second, The Belfast Project an oral history of Irish Republican and Loyalist paramilitaries gathered between 2001-2006 in Boston College. The implications and ethical issues arising from the subsequent

Boston College court case are outlined. The IQDA is a partner of the the Digital Repository of Ireland (DRI), an interactive national trusted digital repository for contemporary and historical, social and cultural data held by Irish institutions; providing a central internet access point and interactive multimedia tools, for use by the public, students and scholars. DRI is a four-year exchequer funded project, comprising six Irish academic partners, and is supported by the National Library of Ireland, the National Archives of Ireland (NAI) and the Irish national broadcaster RTÉ.

## Archives and Qualitative Sociological Research in Spain: Methodological Reflection on New Cases and the Way Ahead

Miguel S. Valles, Complutense University of Madrid | [mvalles@cps.ucm.es](mailto:mvalles@cps.ucm.es)

The 11th ESA Conference, to be celebrated in august 2013 at Turin, may be a suitable opportunity for sharing with colleagues some recent initiatives of archiving qualitative sociological research in Spain. Drawing from two different archival practices encountered in a more or less serendipitous way in 2012, the author of this paper pretends to push a poorly developed research stream of qualitative methodology in this part of Southern Europe. The new cases represent a typological and strategic sample of the process in progress and the way ahead. One archive is housed by a public institution, and has already become

visible and accessible. The other archive belongs to a private research group, with a history of thirty years of sociological and qualitative studies; their primary documents are not yet visible and accessible but have been donated to a university department the audio materials of those studies. Regarding the methodological contribution of the paper to be presented orally, the concepts of quality and backstage materials are related to the concept qualitative archives, in order to approach the debate about dilemmas and possibilities. A proposal for promoting and improving the process in progress is also presented.

## Personal Documents in Post-Modern Society. Proposals Derived from the Life Stories of Adoptive Parents

María-José Rodríguez-Jaume, University of Alicante | [mj.rodriguez@ua.es](mailto:mj.rodriguez@ua.es)

José I Garrigós, University of Alicante | [ignacio.garrigos@ua.es](mailto:ignacio.garrigos@ua.es)

Contemporary post-modern society presents new forms of personal documents which deserve methodological discussion. We propose the study of "personal learning experience documents" as one of these new forms, based on the "formation novel", signifying a progressive personal formation and a search for meaningful existence within society. Personal learning experience documents are characterized by the differentiation and stigmatization of their subjects as compared to the rest of society. One of the main differences between these documents as compared to earlier personal documents (Chicago School) is their instructive quality in the process of constructing new identities. In 2004, Spain became the European

leader in the number of foreign children adopted. Between 1990 and 2011, 31 life stories of Spanish adoptive parents have been published. This study of the "personal learning experience documents" has used an interpretive framework to identify the values, symbols and significance associated with the collective identity of Spanish adoptive parents and aims to discuss the validity and limitations of these personal documents as methodological tools, as compared to "classic" personal documents. The research centres on the perceptions of Spanish adoptive parents with regard to social stigmas which distance them from the standard model of the biological family.

## b10RN20 - Qualitative Research II

Chair(s): Erika Andersson Cederholm (Lund University)

### Sociological Metaphor Analysis. Language Images as a Condensed Structure in the Interaction

Anja Pannewitz, University of Leipzig | [anja.pannewitz@uni-leipzig.de](mailto:anja.pannewitz@uni-leipzig.de)

The lecture is dedicated to the question of the sociological importance of metaphorical concepts. It thus contributes to the theoretical and methodological link between the newer metaphor analysis with sociology. This issue all the more urges, as in practice the interpretation of sequential analysis metaphors sometimes take a central position. The paper attempts to provide the remedy. One hand, the phenomenon of metaphor tentatively

terms of sociological interaction theory can be applied. On the other hand a corresponding integrative method is proposed, which integrates systematically based on the sequential analysis of objective hermeneutics, the analysis of metaphors. Based on a case study, this method of interaction analysis embedded in metaphor analysis is eventually shown.

### Using Novels as a Sociological Source

Mariano Longo, University of Salento | [mariano.longo@unisalento.it](mailto:mariano.longo@unisalento.it)

Literature has often been evoked as a possible sociological source. At the beginning of the 20th century, authors such as Park and Burges (Introduction to the Science of Sociology: 1921) and Znaniecki (The Method of Sociology: 1934) stressed the fact that narrative could be adopted as one of the sources of empirical research in sociology. since the seminal reading by Coser (Sociology through literature: 1963) literature has also been adopted so to exemplify social relations, action in context, human characters. Therefore, it has been adopted as one of the instruments to introduce the somewhat abstract conceptual tools of the sociological jargon. Aim of the paper is twofold. First of all, I will try to explain why literature and narrative are so fascinating for people doing sociology. My idea is that literature (especially in the form

of narrative: novel and short stories) complies with the postulate of adequacy introduced by Alfred Schutz: what is told in the story may be recognized by the reader in term of his/her own experience. On the contrary, sociological analysis may not comply (and perhaps can not comply) with Schutz' postulate, as the sociologist has to interpret reality within his own cognitive and disciplinary framework. Second aspect is that, whereas everyday narratives (for example in the form of narrative interviews) have been analysed within the methodological reflection, that seems not to be the case for literature. The presentation will sketch a possible employ of literature as a sociological source, specifying that the sociologists has always to redefine in his own terms content and meaning of literary narratives (Carlin).

## Uncovering the Contradictory Logics of Creativity in the Senior School Art Classroom: A Study of the Reality of a Social World

Kerry A. Thomas, University of New South Wales, Sydney | [k.thomas@unsw.edu.au](mailto:k.thomas@unsw.edu.au)

This paper reports on an investigation of the contradictory logics of creativity where an expert art teacher and his senior students held true to the belief in creative autonomy, or did what they could to keep up the appearance of maintaining this belief, but in contradictory actions did all they could to overcome the shortfalls of the students' creative resources. The study was an ethnographic and intensive longitudinal investigation of creative activity. It was situated in the socio-cultural context of an art classroom in a secondary school in Sydney, Australia, where the demands of artmaking and the artefacts that ensued were dependent on a tactful reconciliation of the teacher and students' contradictory goals of maintaining their belief while also shoring up the students' performances in final year high stakes assessments and state wide examinations. The study was theoretically framed by Bourdieu's

theory of practice: most particularly, his concepts of habitus, symbolic capital and collective and individual misrecognition. In this paper I focus on the design and methods. The study was designed to provide a systematic way of navigating the role of misrecognition as it emerged in the transactions between the art teacher and his students, framed as a systematic observation in search of evidence for the interrelated function and character of misrecognition as outlined by Bourdieu, in the day-to-day practice of the art classroom. Methods included unstructured, semi structured and structured interviews and observations; semantic analysis of the cultural context and domain reconstruction; triangulation; narrative reconstructions; and the use of a camcorder and digital still and moving records that augmented these methods.

## Defending the Quality of Qualitative Research. The Contribution of Theory of Argumentation.

Mario Cardano, University of Torino | [mario.cardano@unito.it](mailto:mario.cardano@unito.it)

One of the most common criticism moved toward qualitative research is its lack of rigor, where the rigor who critics have in mind is that of quantitative research, based on standardization of the procedures. This idea of rigor conflicts with the distinctive methodological feature of qualitative research, the commitment to attune the observational practices to the characteristics of the object to which they are applied. Moving from this premise, it seems difficult to apply in the field of qualitative research the "logic of inference" and the theory of probability recommended to the ethnographers by one of the most prominent sociologist, John Goldthorpe. In this presentation it will be stated that the syntax more appropriate for qualitative research is

that offered by the theory of argumentation, due to its distinctive context sensitivity, in tune with the flexibility of this kind of social research. The version of theory of argumentation that can best carry out this function is the pragma-dialectical approach expressed in the works of von Eemeren and Walton. The distinguishing feature of this approach lies in its commitment to reconciling the rhetorical with the dialectical aims, carrying out, for qualitative research, the same function that probability theory performs for quantitative research. Two main contexts of application of this syntax will be analyzed. The first will be the case selection, where will be illustrated the use of the proleptic argumentation and that of double hierarchy

argument. The second context will be the reflexive account, where theory of argumentation is applied in order to defend the

robustness of research results and the legitimacy of their generalization.

## 17\_11JS20JS28 - Emotions, Objectification and Reflexivity in Qualitative Body and Sport Research (1)

Chair(s): Monica Aceti (University of Strasbourg), Katarina Jacobsson (Lund University), Haifa Tlili (Paris Descartes University)

### Coming to a Moving Body: Methodological Grapplings

Judy Davidson, University of Alberta | [judy.davidson@ualberta.ca](mailto:judy.davidson@ualberta.ca)

Angela Meyer, University of Alberta | [ammeyer1@ualberta.ca](mailto:ammeyer1@ualberta.ca)

Randi Nixon, University of Alberta | [rlnixon@ualberta.ca](mailto:rlnixon@ualberta.ca)

In this project, we seek to hear from and move with those people who would describe themselves as having been alienated from their moving bodies for most of their adult lives, and work with their kinesthetic and affective experiences (struggles, successes, failures, etc.) of coming to movement as adults. The project is inspired by Davidson's late partner, whose trauma history seriously hampered her embodied movement horizons. This paper will grapple with how one not only addresses the discursive effects of biographical histories, including legacies of ethnocentric, sexist, homophobic, and fat phobic physical education/activity instructional spaces (Sykes, 2011), but also query how affect contribute to kinesthetic experiences of movement. We will stretch the frame of participant observation to participant participation with the researcher – wherein research participants will be invited to move

with a researcher, narrating their in-process, embodied experience. We will think through the dialectical relationship between a skilled mover and an unskilled mover, between someone who struggles with an alienated moving body relationship and a more conventionally skilled athletic body. How does a researcher's investment in being an already confidently embodied subjectivity impact the relational, participative movement and moment – where an adult neophyte mover narrates and does movement. Questions we will address include: How does hegemonic doxa about presumed movement patterns, knowledges and abilities subjectify bodies that experience themselves as alienated from conventional, taken for granted movement capabilities? How might those alienated movers move dialectically with a different kind of approach to movement pedagogy?

## The Challenges of Conducting Qualitative Research into the Experience of Female Football Fans

Caroline Dunn, Regent's College, London | [dunnc@regents.ac.uk](mailto:dunnc@regents.ac.uk)

This paper outlines the methods I used to conduct my research into the experience of female football fans in England. It begins by setting the historical context of research into fan experience, which has long depended on participant observation; and it explores the reasoning behind the selection of a questionnaire as a 'development stage', proceeding to one-to-one interviews with each respondent. It goes on to examine the concepts of 'narrative' and 'memory' as they relate to the respondent's part of the interview, and the challenges they represent. It discusses whether or not completely 'accurate' accounts can ever be elicited – and if so, if that should

matter to the researcher. The paper then puts forward the argument in favour of the researcher positioning herself reflexively and critically, accepting and acknowledging her biases and preconceptions by invoking the concept of the 'aca-fan', as put forward by Jenkins and Hills. It assesses the difficulties of a researcher interrogating a fandom they share, and highlights some examples of how this was encountered in my own research. It concludes that there is no such thing as a 'perfect' piece of research: a social scientist can never be entirely objective and detached from either her respondents or the data elicited.

## Careers of Sociologist in Sport: Epistemological Essay of How Things Intertwine between Subjects and Objects.

Haifa Tlili, Paris Descartes University | [tlilihaifa1@gmail.com](mailto:tlilihaifa1@gmail.com)

Monica Aceti, University of Strasbourg; IUHMSP-CHUV Lausanne | [monica.aceti@unifr.ch](mailto:monica.aceti@unifr.ch)

The objective of this work in-progress is to light up research in the sociology of sport activities. Sport sociologists' career is analyzed as per Becker's method, considering at the same time the objective dimension (status, career plan), the subjective dimension (intimate meanings, emotions, strategies and hurdles) and the diachronic dimension (linear evolution of the career or junction). In the feminist thinking, the normality of "axial neutrality" is questioned. In order to generate a typology of sociologist career, we cross different methods: directed and informal interviews, reflexive work of writing and an autobiographical exchange platform. There are 2 steps for this field study: First, a methodology is tested with a small group of researchers by the way of exploratory exchanges about personal and professional

background. Doing so, a forum for exchange is created allowing to roll out our own careers recollecting personal ethnography and coming to the realization of the many undertakings that might interfere in the structure of our sociological research and its implementation (whether political, institutional, professional, biographical, familial or intimate). In parallel of this reflexive exercise of objectification, direct interviews with sociologists in sport are conducted to understand how they are doing their work as they are themselves involved in situ and belong to the social environment they are studying. For this paper, we will analyze verbatim of sport sociologist, most known in France, with different speciality (specialist of gender studies, queer studies, socio-politics studies, in philosophy, in critical studies, in quantitative studies, in ethno-phenomenology

or in ethnomotricity).

## When Research Calls in Question the Body. Am I an “Able People”?

Rémi Richard, Paris Descartes | [richardremi@hotmail.fr](mailto:richardremi@hotmail.fr)

Does the “not-disabled” researcher have any legitimacy to speak about the body experience of people presenting a physical impairment? For the most radical activists of disability studies, the answer is obvious: to speak about disability, it is necessary to have lived it (Oliver, 1990). Nevertheless, my two years spent in the clubs of powerchair football (the only team sport proposed to people using daily an electric wheelchair) led me to rethink the apparently immense difference, between the “abled people” (“valides” in French) and the “disabled people” (“handi” in French). As my interviews and my investigations on the field progress, the players made me realize that I was not an “abled” (valide), without being a “disabled” (handi). During the data analysis, I realized that I am in a liminal situation (Van Gennep, 1981). I understood, a posteriori, that because of my professional background in a special

institution for disabled people, I am not considered as an “abled” by the powerchair football players without being a “disabled”. The aim of my communication will be, at first, to expose the reflexive processes, which bring me to rethink my “abled people” (valide) position. Then we will see that this position of “not really abled” (pas tout-à-fait “valide”), which was originally unconscious, allowed to lead my research in a privileged way, particularly in giving the possibility of sharing the sports experience of the body in a powered wheelchair. Oliver, M., 1990. The politics of disablement. London: MacMillan. Van Gennep, A., 1981. Les rites de passage: étude systématique des rites de la porte et du seuil, de l'hospitalité, de l'adoption, de la grossesse et de l'accouchement, de la naissance, de l'enfance, d

## Conducting Research in Egypt before and since the Revolution. How Does the Researcher Deal with Personal Emotions, Violence, and Gender Issues?

Chaymaa Hassabo, Collège de France, Paris | [chaymaahassabo@gmail.com](mailto:chaymaahassabo@gmail.com)

Since January 25th, 2011, a revolutionary process has begun in Egypt. Within this context, several new political and social actors have emerged, allowing entirely new interactions in society to take place. Some of these interactions have taken a violent turn, especially, those involving the confrontation of

« revolutionaries » with security forces (either of the army or of the police). This new context has made apparent inevitable political divisions amongst the Egyptian people - sometimes even within families - between pro-revolutionary and anti-revolutionary factions. Before this new political context, I have pondered over

some of these relational dynamics when working on issues that implicate personal, ideological or generational conflicts of interest (the case of Egyptian young political activists for example). What initially appear as « problems » that could hinder the objectivity of the research, eventually became the fruitful resources that helped enrich my fieldwork. Today, the personal implications of the researcher are again questioned because of the overwhelming, unprecedented political situation. However, several questions come to light that need to be addressed with regards to

participatory observation: How does a researcher deal with such situations? How can personal emotions and ethical issues effect - either positively or negatively- ongoing or past research? What gender-specific problems arise when doing research in the current male-dominated situation that poses restrictions on the physical presence of the female researcher in some circumstances (the events involving the Football Ultras are a case in point, but the question also pertains to violent mass demonstrations in general)?

## **Shadow Boxing among the 'Pro's': Autobiography, Embodiment and the Crafting of 'Insider' Understanding among Amateur and Professional Boxers in England.**

Alex Stewart, University of Bedfordshire | [alex.stewart@beds.ac.uk](mailto:alex.stewart@beds.ac.uk)

This paper focuses on the practice and production of what is often termed 'insider ethnography' or 'ethnography at home', or qualitative research carried out in cultural settings intimately familiar to the ethnographer priori commencement of fieldwork (O'Reilly 2012). Following this methodological vein I conducted ethnographic fieldwork over a five-year period among amateur and professional boxer's based in Luton and London, England (Stewart 2008). More to the point, having accumulated many years experiences as a competitive boxer prior to my scholarly endeavour, I ventured into the field enamoured with a belief that being able to 'talk the talk' and 'walk the walk', be a 'real' boxer among the boxing-practitioners studied, I could bodily and intellectually capture other boxer's reality vantages from a somehow more

culturally nuanced and intuitive position of knowing. Whatever suppositions I may have harboured at that time, however, it is safe to say that as a neophyte researcher I had little, if any, appreciation of the intellectual, physical and emotional turmoil I was to experience as I reflexively grappled with issues of strangeness and over-identification in both the field as 'the boxer' and the library as 'the researcher' writing-up and amending the thesis. The discussion henceforth is thus mindful to convey something of the messy and emotionally draining ethnographic journey realised and the necessity of questioning and drawing upon one's evolving 'fieldworker self' in order to bring autobiographical and embodied sense-making assumptions and intuitions to consciousness.

## Speaking With(in): Embodied Reflexivity & Embodied Knowledge

Jessica M Francombe, University of Bath | [jmf22@bath.ac.uk](mailto:jmf22@bath.ac.uk)

Emma Rich, University of Bath | [E.Rich@bath.ac.uk](mailto:E.Rich@bath.ac.uk)

Laura De Pian, University of Bath | [L.De.Pian@bath.ac.uk](mailto:L.De.Pian@bath.ac.uk)

Predicated upon our desire to destabilize any notion of “axiological neutrality” within qualitative research on the (moving) body we examine how our own researcher bodies come to bear across the spectrum of the research process. We engage the cultural identities of ourselves and the individuals we encounter through author body-narratives derived from three separate research studies all of which focus on our biopolitical subjectivity in some way. These narratives point towards the corporeal contradictions of being located within a culture of reading and critiquing bodies while realising our own trajectories as a somewhat complex set of assemblages. They advance a politics of reflexivity that shed light on how we experience, make claims and speak about others as bodies made known through our own bodies which are always in a process of becoming (Coleman, 2008). We consider

speaking with bodies, highlighting the challenges of moving beyond taken-for-granted body knowledge when our physicality legitimises bionormality. We tussle with the vulnerability our subjectivities evoke, we question our responses when our corporeality is silenced and we problematize our ability to engage in border crossing within particular communities when the body and embodied knowing complicates the process. Whilst much has been written about intersubjectivity of data collection and the politics of representation and voice, we advocate for the extension of this reflexivity in relation to the lived embodied experiences of researchers’ presentation and dissemination of their work across public and academic context. Doing so means understanding not what researchers’ bodies might signify, but what they do relationally in the constitution of knowledge.

## Writing Graffiti - Risks and Chances of 'Ethnographic Life-World Analysis'

Paul Eisewicht, Karlsruhe Institute of Technology | [paul.eisewicht@kit.edu](mailto:paul.eisewicht@kit.edu)

The 'Ethnographic Life-World Analysis' developed by Anne Honer is an outstanding approach to field research. Rather than participant observation it favors observational participation (which means the existential involvement of the researcher in the field). In doing so, the aim is to reconstruct: a) the guiding subjective knowledge of the agents in the field and furthermore b) the typical experience of the specific small life-world (which in accordance to the Social Phenomenology of Alfred Schütz is bound to emotions). By this guideline, the subjective and emotional connection of the researcher to the field becomes constitutive for his scientific

work as a basis for the analysis rather than a contamination that has to be avoided (in other words: it turns the unavoidable problem of the researcher in the field in a productive way for sociological insight). The talk focuses on the practices of the Ethnographic Life-World Analysis and the risks and chances of this approach using the example of a research project about learning in youth cultures. The research question is: how do people gain skills in informal settings in the case of the graffiti scene. Writing Graffiti as an activity involves various meaningful actions (e.g. observing, climbing, writing, running, even self-defense) that has to be understood in relation to the

subjective motives and the personal emotional experience in the situation. Using this project as an example this talk addresses: a) the use of the researcher's experience as a participant, b) the triangulation of observational data and c)

the problems with ethnography in deviant fields, which challenge the balance between scientific insight, ethical principles and the trust of the research subject.

## 20JS34 - Qualitative Research on Religion

Chair(s): Regine Herbrich (Leuphana Universität Lüneburg), Bernt Schnettler (University of Bayreuth)

### Uncovering Assumptions. Researching Protestant Churches in Ireland and Italy as an Insider and a Migrant

Alessia Passarelli, Trinity College, Dublin | [passarea@tcd.ie](mailto:passarea@tcd.ie)

In this paper I question whether the inter-methods triangulation (Denzin, 1989) is the most accurate method to be employed in studying religious communities and whether being an insider can shed a different light to the data collected with the inter-methods triangulation. Thus, starting from my research on the integration policies and practices in Protestant Churches in Ireland and Italy in relation to the arrival of immigrants in their midst, I analyse the qualitative approach employed in my research and the different findings emerged in the two countries. The

paper critically reflects on my position as both a migrant and Protestant researcher in Ireland and as an insider policy maker and researcher in Italy. I rely on Ellis (1996, 1997, 2005), Flaherty (1992) and Byrne (2000) on autoethnography, however, although the research is not autoethnographic in the strict sense, there are evident links between what I research, and who I am. I also critically analyse my position – as a privileged insider, a migrant and also a researcher – with the various stakeholders to uncover underlying meanings and assumptions.

### Analyzing Media Material on Religion and Child Sexual Abuse

Andreas Häger, Åbo Akademi University | [ahager@abo.fi](mailto:ahager@abo.fi)

This paper discusses analysis of a media material on religion and child sexual abuse. The material relates to a case in Finland, involving a preacher from a conservative Lutheran group having sexually abused his grandchildren. The paper raises some issues relating to material and method in this particular study. The study deals with a complex and delicate topic which stirs up strong emotions and requires that the researcher avoids risks of either demonizing

the religious group or belittling the crime. The material exists without the influence of the researcher, it is "spontaneous", and this fact has consequences. The method used is discourse analysis. In the study, I claim to find various discourses in the material, and a central methodological question is the validity of these claims, particularly considering the complexity of the case. The significance of genres and channels, particularly anonymous web discussions, is also discussed. The main

question is how discourse analysis of this material can contribute to knowledge of the particular case; of the issues of media, religion and child abuse; and of the place of religion in contemporary society in general. Power is a central aspect in discourse analysis, and the

media discussion in this case, with editorial material and an extensive public debate on religion and child sexual abuse, can be seen as a power struggle between religious institutions, media and the secular public.

## Biographical Narratives and Religious Sects

Silvana Greco, University Milan-Bicocca | [silvana.greco@unimib.it](mailto:silvana.greco@unimib.it)

The paper will focus on the importance of biographical narratives such as diaries, letters and autobiographies in studying the rising and the development of religious sects and their relationship to orthodoxy, with special attention to their interaction with social and economic crisis. Drawn on a specific and still ongoing qualitative research on members of a Jewish sect, the paper will highlight how biographical narratives are particular useful in

showing deep motivations, which drive single individuals in moment of crisis to enter in a sect, and their ambivalent relationship with the orthodox religious community. In addition, the paper reflects on how biographical narratives permits to understand the influence of the broader social context on the choice to join but also to leave the sect. Gender differences for this particular religious adherence will be underlined as well.

## Reflecting on How to Study Popular Religion

Carolina Nuti, University of Pisa | [carolina.nuti@sp.unipi.it](mailto:carolina.nuti@sp.unipi.it)

In Italy the very concept of popular religion draws its origins and evolved under the influence of Antonio Gramsci's theories, according to which popular religion acted in opposition to the hegemonic and institutionalized religion of the elite. Although an unanimously shared definition of popular religion has not been reached in the academic community, the concept is associated with a religiosity characterized by spontaneity and affectivity, responding to the need for a more direct and immediately profitable contact with the divine. However, with the complexification of social structures within advanced capitalist societies in the twentieth century, the idea of popular religion underwent a crisis from which it has not yet recovered. Nevertheless, while on the one hand the phenomena labelled as popular religion suffered, and still suffers,

from an "attrition" from a theoretical perspective, on the other hand, it continues to hold the interest of scholars and an empirical analysis is still needed. In this paper I will illustrate the methods used to study the devotion of people visiting the Sanctuary of Montenero (Li), adopting the perspective of Symbolic Interactionism with particular reference to the indications of Herbert Blumer. Following an initial phase dedicated to the exploration of social processes at work in this place, attention focuses on the analysis of the contents of the books of the pilgrims, in which they have left messages, on the visual analysis of the contemporary votive tablets, on the pilgrims themselves and on a prayer group composed of young devotees, studied through participant observation and in-depth interviews.

## Territorial Transformations and Religious Rites: The Case of Saint Rosalia.

Rossana Marianna Salerno, Kore University of Enna | [rossana.salerno@unikore.it](mailto:rossana.salerno@unikore.it)

The project of my research analyzes the correlation between the territorial transformations and religious rites, and the context which are development. Central focus of research is therefore the relationship that the religious rites entertains with the territory. The religious case of Saint Rosalia contains, in the context, the whole of the rites and meaningful symbolic elements. The Feast of Saint Rosalia in Palermo, Sicily's best-known religious festival, is traditionally held from 10 to 14 July and 3 to 4 September. The adopting research methodology into the territorial transformations and religious rites is essentially an ethnographic/qualitative analysis. The goal is to draw the main characteristics of a culture living "within" and "as a member" of the shared beliefs. The ethnographic research is a typical example of qualitative observations: firstly the survey is

conducted through field observations and secondly through observation lens by cameras, video cameras and voice recorders. Deriving and emphasizing empirically human behaviors, social facts and interactions among social actors. The dynamic relationship that exists among a religious rite and the territory that it entertains is interpreted and analyzed as a form of protection, offered from the sacred on the place in which he resides. This is the beginning of an analysis that sets on the same plan two varying specifications: one on side the rite (sacred and profane) and other from the territory. The religious beliefs and the rites are a circle in which the research of the meaning of the existence manifests. The social phenomenon and its characteristics is given by comparing aquired data and observation results analysis.

## RN20 - Poster Session

### Is There Diary a Proper Sociological Method for Studying Changes?

Ozana Cucu-Oancea, Romanian Academy | [ocucuoancea@yahoo.com](mailto:ocucuoancea@yahoo.com)

This paper focuses on the critical analysis upon using diaries, seen from a historical perspective at how it was practiced in different paradigms in the humanistic-social sciences. The exposé also considers the methodological and the ethical implications of using this method, underlining, in this respect, the aspects related to the preservation and reuse of such kind of materials. By putting into balance the trumps and downsides of the diary methods, the paper wants to highlight, in fact, the importance of using them in studying a wide range of specific problems from the humanistic-social sciences, especially when it talks about crisis periods and other kinds of

changes, that require a longitudinal perspective for a better understanding. The ultimate purpose of the paper is, therefore, that of prompting the social scientists to look more carefully and more trustingly at the alternative of choosing the diary methods, as a potential powerful tool for sociological research, providing them, at the same time, with possible directions in discerning between the favorable and unfavorable situations for using them. From my point of view, the use of diaries in sociological literature depends, on one hand, on the more general societal dynamics. On the other hand, it is influenced by broader trends in sociology and social

sciences, and on the availability of digitalized diaries, and computer tools to analyze them. Consequently, I anticipate an already visible

tendency to reassess the importance of this source to retrieve information in order to empirically validate sociological explanations.

## Types of Textual Analyses Applied to Qualitative Data within Sociological Research

Irina V. Trotsuk, Peoples' Friendship University of Russia, Moscow | [irina.trotsuk@yandex.ru](mailto:irina.trotsuk@yandex.ru)

Most scientific articles use word combinations with terms 'coding' and 'analysis' as quite clear rarely identifying any differences between them. Such a position is quite inexcusable within sociological frames due to the serious borders as well as intersections between the theoretical and empirical levels here. If we are to conduct an empirical sociological research we have to find definite unambiguous empirical indicators to all semantic constructions that identify the object, the subject and the categories of the textual analysis that may go without any saying within other disciplinary frames. The identification of textual analysis type appears to be understandable if we follow such a distinction as the focus of our attention: the object, the subject or the categorical scheme. The first two patterns leave us within the theoretical level of sociological work. That

is, for instance, if we look for the dominant discourse that underlies biographical narratives of soviet people we can name our work both the narrative analysis (if we pay close attention to both the structural properties of texts and their subtle linguistic nuances, concentrating on the object of our study, the narrative data itself) or discourse analysis (that supposes focus on the subject of study regardless the type of data under consideration). Within the empirical sociological research the only appropriate way to work is to fulfill all the requirements to constructing content analysis categories and tools. How we prefer to call this process and its results – biographical, narrative, discourse, textual etc. analysis – doesn't really matter as long as we follow the scientific method rules.

## The "Biogram" and Ideal-Typical Processes of Identity Construction

Ivana Acocella, University of Florence | [acocella@unifi.it](mailto:acocella@unifi.it)

This paper aims to present the "biogram" as a new and useful tool for analyzing materials produced by biographical approach. This tool allows to match the interest in the individual and in the subjective meanings with the temporal depth and the multi-dimensional structure of social phenomena. The aim is to investigate how several "trajectories of life" change over time and are integrated into different paths of identity formation. Furthermore, from the analytical point of view, the purpose is to overcome the obsolete opposition between "objectivism" and "subjectivism" (which often characterized the debate on the social sciences), avoiding to

reduce each human action to social factors deterministically, as well as every social event to human actions exclusively. Through the biographical approach, the object of study is intensively investigated (identifying its main features), rather than extensively (namely how much it is widespread). Especially, the use of "biogram" may be useful to elaborate different types that are analytical syntheses (in order to describe a phenomenon) or interpretative syntheses (in order to identify processes related to mechanisms of concatenation, also causal). In particular, this tool will be used to identify processes of configuration identity, emphasizing the main ideal-typical features.

## RN21 - Quantitative Methods

### b01RN21 - Measurement Quality and Measurement Equivalence

Chair(s): Kathrin Komp (Umea University)

#### The Effects of Measurement Error in Gender Wage Gap Models: A Comparison of HILDA and BHPS

SC Noah Uhrig, University of Essex | [scnuhrig@essex.ac.uk](mailto:scnuhrig@essex.ac.uk)

Nicole Watson, University of Melbourne | [n.watson@unimelb.edu.au](mailto:n.watson@unimelb.edu.au)

Our research addresses the question of to what extent conclusions about gender based wage inequality are muddled by measurement error? An important use of large household panel surveys is an examination of inequality dynamics in society. An example might be how research on discrimination in employment focuses on sex or race differences in wages, job quality, mobility chances or status outcomes. A well known problem, however, is how random measurement error can lead to attenuation bias in observed substantive coefficients. Moreover, there is mixed evidence on how panel conditioning might affect measures as panels age. One approach to assessing data quality is to estimate the

reliability of variables using quasi-simplex Markov models initially formulated by Heise (1969) and Wiley and Wiley (1970). This approach relies on panel data with at least three time-points to estimate reliabilities from a measurement model incorporating latent true values. Comparing data from the Household, Income and Labour Dynamics in Australia Survey and the British Household Panel Survey, our research examines whether these estimates of reliability derived from panel data might be useful for adjusting coefficients in an analysis of the gender wage gap. We conclude with a discussion of how reliability assessments may affect other substantive research using panel data.

#### Measuring Racism and Xenophobia via Survey Methodology

M<sup>a</sup> Ángeles Cea D'Ancona, Complutense University of Madrid | [macda@cps.ucm.es](mailto:macda@cps.ucm.es)

This paper offers the results of two experimental surveys carried out in Spain within the MEXEES I (SEJ2005-00568) and MEXEES II (CSO2009-07295) Projects. Three survey modes were compared: (1) The conventional face-to-face survey; (2) A modified face-to-face condition where respondents answered a subset of questions in a self-administered form; (3) A completely non-interviewer condition where questionnaires were handed out and picked up

by the interviewers on an agreed upon date to enhance response. Telephone survey was rejected as an experimental treatment, both because it required a variation in the procedure of selection of the sample and because of its lesser adequacy for racism and xenophobia measurement. Although the respondent's political ideology is what most determines the scores on xenophobia versus xenophilia scales, some support for the social desirability bias and survey mode effects was

obtained. Self-administration of questionnaire encourages declaration of xenophobia, but contrary to what was hypothesized, the effects occur more consistently in less direct or more subtle indicators of racism and xenophobia; precisely the indicators that collect more opinions against immigrants and ethnic minorities in Europe and Spain. Results also show the lesser appropriateness of (fully or partially) self-administered modes among

persons with a low educational level (a higher nonresponse error). However, the results do not back that an increase in privacy raises the probability (among respondents with higher educational levels) of expressing negative attitudes towards immigrants. On the contrary, less educated respondents are more affected by survey mode. Some proposals for survey questions will be given.

## Analysis of Response Rate Based on Missing Data from the European Social Survey

Jolanta Perek-Bialas, Jagiellonian University, Cracow | [jperek@sgh.waw.pl](mailto:jperek@sgh.waw.pl)

Joanna Wójcik, | [joanna.wojcik1988@gmail.com](mailto:joanna.wojcik1988@gmail.com)

Both refusals and untrue responses strongly contribute to the increase in risk of getting biased survey results. The research question of the paper: is it possible to identify individuals characterized by a very low propensity to respond in surveys taking their socio-demographic features into consideration? We estimate and compare the logistic regression and ordered logistic regression models in terms of correctness of identification of respondents of different socio-demographic characteristics who showed different levels of propensity to respond. We used ESS data for Poland (2010/2011) (n=1751 cases). In analysis we take into account all types of refusals, missing data or untrue answers which represent no and a low propensity to respond in surveys. We performed analysis of willingness to respond in ESS survey in STATA

to correctly estimate the marginal effects of interaction terms in the implemented nonlinear models with interaction terms in logit and probit models (Ai, Norton, 2003). Our analysis show a lot of possibility to identify those who are less willing to participate in the survey like e.g. males having children, have 67% higher odds for responding to at least 12 questions than childless males, *ceteris paribus*. As a conclusion weighted models achieved more preferred values of fit measures at each stage of the estimation process. Introducing statistically significant interactions into nonweighted logistic regression models visibly improved their goodness of fit. Logistic regression models better fitted data than ordered logistic regression models.

## Expanding Effect Measures: A Graduated Measure of Distance to the Labour Market for the Unemployed

**Sofie Dencker-Larsen**, SFI – The Danish National Centre for Social Research & the Department of Sociology at the University of Copenhagen. The PhD is funded by SFI – The Danish National Centre for Social Research, the Department of Sociology at the University of Copenhagen, the Municipality of Copenhagen and the Danish Ministry of Employment | [sdl@sdi.dk](mailto:sdl@sdi.dk)

This paper aims at developing and testing a graduated measure of distance to the labour market for the unemployed. During a financial crisis a key question is whether the money spent on Active Labour Market Programmes is well spent? Studies show that ALMPs have little, non-existent or negative effect on unemployed persons who have been assessed by their case worker to have problems besides their unemployment. These studies typically use gained employment or reduced welfare benefit dependency as effect measures. To the author's knowledge there are no validated effect measures that include the steps before actual entry to the labour market; steps where the unemployed may feel healthier, more confident, better equipped for a job etc. and thus have moved closer to the labour market. As health problems are widespread among the group in question, the measure that will be

developed and tested is expected to be based on internationally recognized measures of health and non-cognitive skills. The validity of the measure as a measure of distance to the labour market is to be tested in three ways: 1) Applying Factor Analysis to data from a sample survey of unemployed persons in Copenhagen, 2) Analyzing if the measure is a good proxy for future employment using detailed register data, 3) Comparing it with findings from qualitative interviews with case workers and unemployed persons. The measure draws on marginalization theories in viewing unemployment as degrees of marginalisation from the labour market. Marginalisation is seen as points in a spectrum between social exclusion from the labour market in one end and social inclusion in the labour market at the other.

## Measures of Subjective Social Status: How Do Objective Indicators Relate to Subjective Evaluation of Social Status?

**Miloslav Bahna**, Slovak Academy of Sciences | [miloslav.bahna@savba.sk](mailto:miloslav.bahna@savba.sk)

**Roman Džambazovič**, Comenius University, Bratislava | [dzambazovic@gmail.com](mailto:dzambazovic@gmail.com)

Subjective social status measurement has been a topic in social sciences at least since Centers used his subjective social class question in 1945. In our contribution we focus on two measures of subjective social status – the subjective social class and the top-bottom ladder scale question. We analyze the connection of those subjective measures with objective social status indicators. We assert that across countries, cultures and continents

compared to the top-bottom question, the subjective social class question inflates the connection with objective social status indicators such as education and occupation. This is a robust finding tested on two large ISSP datasets from 1999 and 2009 including data from dozens of countries and various cultural settings. In almost all countries included in the ISSP Social Inequalities 1999 and 2009 surveys objective social status

variables explain more of the subjective social class variation than of the top-bottom answers. On this background we present a modified subjective social class question – one which omits the “worker class” category – that was experimentally included in the Czech and Slovak ISSP Social Inequalities 2009 surveys.

We conclude that omitting “worker class” from the social class question weakens the connection of education and occupation with subjective social class placement. Nevertheless the relation still remains stronger than for the top-bottom question.

## a02RN21 - Data Analysis

Chair(s): John MacInnes (University of Edinburgh)

### Inter-Model Comparisons with Logit and Probit: Problems and Solutions

Henning Best, Gesis - Leibniz Institute for the Social Sciences | [henning.best@gesis.org](mailto:henning.best@gesis.org)

Christof Wolf, Gesis - Leibniz Institute for the Social Sciences | [christof.wolf@gesis.org](mailto:christof.wolf@gesis.org)

Logit and Probit models can be thought of as resting on a linear model for an unobserved variable  $y^*$  from which a nonlinear model for the probability of  $y=1$  is derived. Based on a series of Monte-Carlo simulations we demonstrate that the regression coefficients from logit and probit models should not be compared between nested models. However, as model building in the social sciences oftentimes employs a stepwise procedure a method allowing valid comparisons of effect

sizes between models would be advantageous. Results from our simulation study show that  $y^*$ -standardized coefficients are of limited utility and coefficients from a linear probability model should only be used with normally distributed variables. Average marginal effects and regression coefficients corrected by a method proposed by Karlson et al. (2012) lead to satisfactory results and can be compared between nested models in many different scenarios.

### Analysing School Value-Added with a Bivariate Multilevel Model

Patricio Troncoso, University of Manchester | [patricio.troncoso@postgrad.manchester.ac.uk](mailto:patricio.troncoso@postgrad.manchester.ac.uk)

The aim of this paper is to present a novel application within the multilevel modelling framework for the study of pupils' performance. Multilevel models are especially useful in Social Sciences when dealing with high levels of data clustering, as happens with the analysis of school effects on pupils' performance in educational research. This research seeks to analyse the effects of socio-economic characteristics at the level of pupils, classrooms, schools and local authorities on pupils' performance in Mathematics and

Language. This paper uses the Chilean Ministry of Education's standard tests datasets (N=202,605) from 2004-2006 to illustrate two novel implementations of multilevel analysis: (a) 4-level hierarchical model of Mathematics and Language scores, and (b) a bivariate response (4-level) model for both topics. 2-level models have become standard practice in educational research of school effects; however, these models lack precision when significant additional levels are ignored. This research shows that the specification of two

additional levels to the model is highly relevant and decreases estimation bias. Furthermore, a bivariate model for Mathematics and Spanish together is also implemented to account for the correlations between the two topics and resolve issues around multicollinearity and endogeneity of the separate univariate models. This research intends to contribute to school

value-added modelling by increasing the number of levels to analyse additional relevant structural effects and by considering the relationship between two of the most relevant educational outcomes, implementing a bivariate multilevel model. The ultimate outcome would be more reliable and precise school effects estimations.

## **Modelling Bivariate Repeated Ordered Categorical Data on Attitudes to Gender Roles in Britain**

**Damon M Berridge**, Lancaster University | [d.berridge@lancaster.ac.uk](mailto:d.berridge@lancaster.ac.uk)

**Roger Penn**, Queen's University, Belfast | [r.penn@qub.ac.uk](mailto:r.penn@qub.ac.uk)

The paper will examine how attitudes to gender roles have changed over time. It will be based upon longitudinal data taken from the British Household Panel Survey [BHPS] and will extend our earlier univariate analysis published in *International Sociology* in 2009. In the earlier paper, we focused on the analysis of one Likert item on attitudes to gender roles at two waves of the BHPS [1991 and 2007]. The current paper will analyze three Likert items on attitudes to gender available at every other wave since 1991. We will analyse these

multivariate ordinal categorical data by fitting a series of bivariate ordered response models with correlated random effects to each pair of items using the SABRE software (<http://www.sabre.lancs.ac.uk>). The paper will explore the effects of a set of explanatory variables derived from the relevant sociological literature. These include gender, age, social class, ethnicity, marital status and educational attainment, as well as political and religious affiliation.

## **Logistic Regression and Log-Linear Models in Social Research: How to Make Their Application to Complex Tables more Understandable**

**Fabrizio Martire**, Sapienza, University of Rome | [martire.f@gmail.com](mailto:martire.f@gmail.com)

When applied to polythomous variables, logistic regression and log-linear models – two of the most used techniques for the analysis of qualitative data – produce output less understandable than output produced by the traditional techniques for the analysis of quantitative variables. Difficulties derive from the fact that the more are the categories of a polythomous variable the more are the necessary parameters to describe its relationship with other variables. This problem depends on the fact that the associations among qualitative variables has to be read in terms of interactions among categories rather

than as relations among variables as wholes. It's a problem connected to the meaning of statistical relationships and, therefore, not solvable on a technical or mathematical level. Starting from the fact that the fortune of an analysis technique is more due to a kind of intuitiveness of its outputs than to the comprehensibility of its algorithms, in the paper I will show and discuss some of the solutions proposed in the specialised literature to make outputs of logistic regression and log-linear models more understandable. In particular I will focus on the use of contingency tables as visual devices to display statistical

coefficients and models parameters, showing pros and cons of this strategy by its application

to different kinds of log-linear model and logistic regression outputs.

## **a03RN21 - Experimental Methods and Simulation in Sociological Research II**

Chair(s): Meitinger Katharina (GESIS - Leibniz Institute for the Social Sciences)

### **Time Use and Social Comfort: Experimental Analysis**

**Viktor Artemov**, Institute of Economics and Industrial Engineering, Siberian Branch, Russian Academy of Sciences | [arttime@ieie.nsc.ru](mailto:arttime@ieie.nsc.ru)

**Olga Viktorovna Novokhatskaya**, Institute of Economics and Industrial Engineering, Siberian Branch, Russian Academy of Sciences | [olganovo@ieie.nsc.ru](mailto:olganovo@ieie.nsc.ru)

1. This is an attempt to answer a question about how changes in the time use and in health of the population relate to each other, what connection exists between duration and character of work and the state of health. 2. The paper draws on the data from the time budget surveys of the rural population of the Novosibirsk region (IEIE SB RAS, 1986-1987, 1993-1994, 1999, 2004-2005, 2011-2012 – 1400-1100 persons in each). 3. Last 25 years are a unique period in the Russian modern history reflected in most different forms on all aspects of life, including time use, everyday activity and health of population. 4. The analysis of relationship between time use and health was made at micro and macro levels. At the former

health is presented by indicators of the respondent's state of health, diseases he has come through, at the second by life expectancy. Time use is presented by work duration and character and by aggregated structure of average time budget, respectively. The assessment by respondents of changes in living conditions and in their own state is seen as a measure of social-psychological well-being of the population. 5. The direction and degree of influence between "time use – state of health" depend on macro and micro life conditions, on social-psychological well-being of the society and individual, on the "initial" state of health of the individuals.

### **The Validity of Scenario-Techniques in the Analysis of Prosocial and Deviant Behaviors – Effects of Vignette Form and Social Desirability**

**Stefanie Eifler**, University of Halle-Wittenberg | [stefanie.eifler@soziologie.uni-halle.de](mailto:stefanie.eifler@soziologie.uni-halle.de)

Scenario-techniques have been frequently applied to the analysis of so-called sensitive topics. However, up to now it remained an open question whether vignettes lead to more valid measures of sensitive topics. A variety of research strategies have been employed in order to assess aspects of the validity of scenario-techniques. In this paper, various

forms of prosocial behaviors are taken as an example. It is assumed that subjects tend to overreport the probability and frequency of prosocial behaviors in principle depending on their tendency to answer in a socially desirable way. The present study is based on Paulhus' concept of self- and other-deception. Abelson's Script Theory allows the assumption that the

overreporting of prosocial behaviors not only depends on the subject's realisation of self- and other-deception but also on formal features of the vignettes. This assumption is analysed on the basis of an experimental study (2\*3-design). A mail-survey of adult inhabitants of a German city aged 18 to 65 was carried out (n=2382). Analyses of variance revealed that the formal features of vignettes as well as the tendency of subjects to respond in a socially

desirable way exert effects upon the probability and frequency of prosocial and deviant behaviors depended on formal features of the vignettes as well as on the tendency of subjects to answer in a socially desirable way. However, the patterns of these results varied with the behaviors analysed. The results are discussed with regard to the underlying theoretical assumptions.

## **Do High Status Individuals Like Lowbrow Cultural Products? An Experimental Study**

**Viviana Zenucchini**, University of Brescia | [viviana.zenucchini@eco.unibs.it](mailto:viviana.zenucchini@eco.unibs.it)

**Flaminio Squazzoni**, University of Brescia | [squazzon@eco.unibs.it](mailto:squazzon@eco.unibs.it)

**Giangiaco Bravo**, University of Torino | [giangiaco.bravo@unito.it](mailto:giangiaco.bravo@unito.it)

This paper focuses on the relation between status and consumptions of "cultural" goods, such as songs, books and movies, and examines the role of social influence mechanisms. Studies on cultural consumption and social stratification showed that individuals with high social status are omnivores, i.g., they consume different kind of goods, while individuals with low social status are univore, i.g., they consume a narrow range of goods. It is likely that differences in the consumption of cultural goods are conditioned by social influence mechanisms and that exposure to these mechanisms depends on social strata one belongs to. These can also determine the range dimension of cultural consumption. Individuals more sensitive to social influence will chose only mainstream products, following

univore consumption. Omnivore individuals will be less sensitive to social influence. We tested these hypotheses in a lab experiment with 120 subjects, with different status, called to listen to and rate 10 songs. Status was established with occupations extrapolated from Italian prestige occupation scale. An artificial rate for each song was displayed to half of the subjects to mimic social influence. We created an index to measure social influence subjective sensibility, and we found that individuals with high status were less influenced by social influence and followed omnivore consumption. Vice-versa, low status subjects followed univore consumption and their preferences were more concentrated on mass cultural products.

## **A New Look at Experimental Studies of Everyday Social Cognition: Examining Relationships between Descriptive and Normative Components in Evaluations of Distributive Justice.**

**Inna F. Deviatko**, The Higher School of Economics, Moscow | [deviatko@aha.ru](mailto:deviatko@aha.ru)

"Naïve" sociological concepts and judgments made by ordinary people are widely considered by sociologists as constitutive for the social

world itself. However, attempts to study empirically the relationships between normative, descriptive and explanatory

components of “folk” social knowledge are rare even in the burgeoning field of distributive justice research. The paper argues that sociological analysis of justice perception phenomena requires a closer examination of their purported relationships with everyday descriptive knowledge of social facts. The results of an experiment (N=72) studying relationships between individual judgments on fair division of putative centralized transfer payments to different groups of the general population (age cohorts and employees from different economic sectors) and subjects’ pre-existing ordinary knowledge of relevant social and economic facts are analyzed. The experimental results obtained indicate that in most cases no significant correlations were

observed between individual judgments on just distribution of money transfers aimed at equalizing average salaries and Internet-access levels, on the one hand, and relevant everyday predictions for salaries and Internet-access distributions, on the other hand. The weak-to-moderate correlations between individuals’ everyday cognitions and their justice-related judgments were revealed only in few cases and could have a direction contrary to one theoretically expected. The results obtained demonstrate a promise of the new experimental style of everyday social knowledge research and give indirect support to a “cognitivist” theory of moral feelings (R. Boudon, 1997) while casting doubts on broad interpretations of “the Thomas theorem”.

## **b03RN21 - Experimental Methods and Simulation in Sociological Research I**

Chair(s): Sin Yi Cheung (University of Cardiff)

### **Fiscal Federalism, Economic Segregation and Regressive Taxation: An Empirically Calibrated Micro-Macro Agent Based Simulation of Exit and Voice**

Debra Hevenstone, University of Bern | [hevenstone@soz.unibe.ch](mailto:hevenstone@soz.unibe.ch)

Proponents of Agent Based Modeling (ABM) argue that simulation should test whether specific mechanisms linking the macro and the micro levels are] sufficient explanations of empirically observed social phenomena. Traditionally ABM has focused on more abstract models, but in recent years attention has shifted towards the goal of integrating empirical data into more realistic models[. Such models can then be used to test hypothetical scenarios. In my talk I will present an ABM of fiscal federalism as an example of a study in which simulation is merged with real data and discuss several issues in simulation design. Previous research has found a correlation between federalism and government size, economic segregation, and local taxation design. First, I will show that

two simple mechanisms, Albert O. Hirschman’s exit (also relevant to Tiebout, 1956) and voice can be used to link the micro and the macro in a sufficient explanation for the observed empirical phenomena under fiscal federalism. Second, the simulation will be used to illustrate the potential and the limitations of integrating data into simulation. I will show how data on taxes, income distributions, and public goods expenditures were used in the simulation design, and how data on secessions and amalgamations can be used for validation. The issue of matching empirical and simulation time will also be discussed. Third, the simulation will be used to illustrate how empirically calibrated ABMs can be used to create in-silica experiments, in this case, testing which government policies lead to

optimal social outcomes.

## The Use of Multiple Imputation Methods to Predict Electoral Outcomes

**Modesto Escobar**, University of Salamanca | [modesto@usal.es](mailto:modesto@usal.es)

**Antonio M. Jaime**, University of Málaga | [amjaime@uma.es](mailto:amjaime@uma.es)

The literature on electoral forecasting has focused on the prediction of electoral outcomes by using aggregate variables. At the same time, there is huge literature on electoral behavior aimed to explain voting choices but with limited forecasting ability. In this research we use modern imputation techniques to forecast electoral outcomes by using individual survey data. We draw on the theoretical models on voting behavior to estimate the probabilities of vote for the main political parties competing in one particular election, depending on socio-demographic attributes, ideological profile and voters' preferences. To illustrate the use of imputation

techniques to predict electoral outcomes, we focus on Spanish recent electoral history. Data come from pre-election studies carried out by the Spanish Centro de Investigaciones Sociológicas (CIS) in every election since 1979 till the most recent election in 2011, covering a total of ten elections. We run several models, including multiple imputation by chained equations of ordinal and multinomial logistic regressions, and then compare estimates to decide which model fits better the electoral outcome in each election. To do that, results obtained from imputation techniques are compared with real electoral outcomes in order to assess the accuracy of the procedure.

## Unpacking the Social Mechanisms of Peer Review: An Agent-Based Model

**Flaminio Squazzoni**, University of Brescia | [squazzon@eco.unibs.it](mailto:squazzon@eco.unibs.it)

**Francisco Grimaldo**, University of València | [francisco.grimaldo@uv.es](mailto:francisco.grimaldo@uv.es)

**Juan Bautista Cabotà**, University of València | [juan.cabota@uv.es](mailto:juan.cabota@uv.es)

This paper investigates the consequences of referee behaviour on the quality and efficiency of peer review through an agent-based model. We assumed a population of  $N$  scientists ( $N = 200$ ), randomly selected each to fill one of two roles: author or referee. We assumed that authors and referees were randomly matched and created two scenarios where (1) referees were randomly more or less fair in their judgment of author submissions and (2) scientists tried to outcompete each other by underrating potential competitors (i.e., those with equal or greater status). We measured peer review outcomes in terms of evaluation bias (Type I and II errors, i.e., number of low quality papers eventually published and high quality papers eventually rejected), resource

dynamics and accumulation (e.g., growth and inequality of resource distribution between scientists) and reviewing expenses. We tested various publication rates, more or less competitive. Simulation results show that the quality and efficiency of peer review is extremely sensitive to scientist's heterogeneous behaviour. We found that unfair behaviour of referees increased evaluation bias but also imposed higher reviewing expenses. On the other hand, it ensured less inequality in resource distribution than fair behaviour, which provided room for cumulative advantages rewarding more productive scientists. These results can provide insights on the micro-sociological foundations of the Mertonian's "Saint Matthews effect" in science.

## Analytical Techniques to Discover the Recurrences in the Data

Maria Carmela Catone, University of Florence | [mariacarmela.catone@unifi.it](mailto:mariacarmela.catone@unifi.it)

This work is a study of some linear and non-linear techniques used to show hidden recurring elements in a time series. The data is examined, using the time chart, the probability distribution, the phase space plot and the power spectrum in order to find the general trend, the relation between consecutive data and the possible periodicity. Then, the structure of the data emerge from the recurrence plot, that is an important tool of data visualization. In this diagram the cartesian coordinates are provided by indexes of the delayed vectors, made up of the data, and the

euclidean distances between these vectors are represented using a colour scheme: short and long distances are indicated by light and dark colours respectively. In conclusion, the analysis is performed by calculating various non-linear coefficients, that is the correlation dimension, the embedding dimension and Lyapunov exponents, in order to discover signs of determinism. These techniques will be explored from a theoretical point of view and an empirical one, examining the behaviour of visits to a website.

## 04RN21 - Methods and Applications of Social Network Analysis

Chair(s): Georg Müller (University of Fribourg)

### Volunteers V.I.P. : The Network of True Social Cohesion

Beba Molinari, University of Genoa | [beba.molinari@unige.it](mailto:beba.molinari@unige.it)

Mariano Vacca, University of Naples | [marismith@libero.it](mailto:marismith@libero.it)

Volunteering in Italy has deep roots, it is a phenomenon that transforms in to a dynamic reality constantly evolving into a variety of explicit forms with different connotation values. Both in terms of ideal (which affirms the objectivity of merit, as a gesture of generosity that is expressed in the community-relations) and on the economic, voluntary organizations represent an important relief for a wide spectrum of Italian society, plays an important roll to support public and private institutions. The objective of this paper firstly is to put highlights in the structure of the research and highlight the contribution that a Social Network Analysis makes to the qualitative and quantitative methods. The

challenge will be to consider the Social Network Analysis as a tool to examine - drawing from the Theory of Action - conditions and products of social interaction (Cohen, 1971), going beyond the descriptive level and placing instead on a more purely explanatory level . Thanks to attitudes and behaviors adopted by volunteers, in the process of data analysis a scenario has emerged as strongly oriented towards a series of bottom-up well aware actions and interventions, deriving from individual behaviors guided by a rational action towards a target, which is defined in this case as an improvement of one's level of well-being thanks to social cohesion achieved in an associative context (Tocqueville, 1968).

## Communications Networks as Mediators of Economic Crises' Individual Outcomes – The Part Played by Mass Media and Personal Communications in the Transpiration of Economic Phenomena

Frank Mangold, University of Hohenheim | [frank.mangold@uni-hohenheim.de](mailto:frank.mangold@uni-hohenheim.de)

Michael Schenk, University of Hohenheim | [michael.schenk@uni-hohenheim.de](mailto:michael.schenk@uni-hohenheim.de)

**Goals** Given the current economic crisis's urgency, considerable economic research has been devoted to its macro outcomes. Fewer studies, however, have dealt with its effects on individuals' personal lives. These haven't been sufficient to describe the social mechanisms through which economic crises transpire from the macro to the micro level. Especially, presumably important mediators such as mass media and peer effects have widely been neglected. Therefore, the paper addresses how individuals utilize media and personal communications in coping with economic downturns. Its purpose is twofold. First, a deeper understanding of the interplay of mass communications and personal communications on economic issues is provided. Second, it is shown how combining social network and multilevel analysis helps to overcome theoretical discrepancies about the interplay of mass media and personal communications.

**Methods & Measures** The paper relies on data representative for the population of Germany (n=10.100). These data combine standard survey results on respondents' characteristics with results from ego-centered network analyses on their communication networks. A multilevel latent-variable framework is applied. The determinants and effects of communications on economic issues are detected by combining methods of mediation and compositional effect analysis. Results Results show that news media and personal communications are important assets in coping with economic crises. Furthermore, mass communications and personal communications are essentially multilevel phenomena which heavily depend both on individuals' dispositions and their social networks. Thus, single-level studies have yielded incoherent findings on their interplay.

## Social Capital in Associations - A Study on Sources of Social Resources

Julia Häuberer, University of Hamburg | [julia.haeuberer@wiso.uni-hamburg.de](mailto:julia.haeuberer@wiso.uni-hamburg.de)

In times of the European fiscal crisis, resource allocation by the welfare state as well as by employment will be reduced. First, social expenditures are likely to be reduced to allow nations to consolidate their budget. Second, the crisis comes along with increasing unemployment rates – especially among younger well educated cohorts. Individuals need to compensate for this loss of resources. Fruitful sources of social resources are social networks. Members in voluntary associations constitute formal networks that are in the focus of the presented paper. Thus, I ask which kinds of associations are most valuable in

providing social resources. I present results of the Eurobarometer 62.2 survey carried out in 2004. The survey covers all European member states and includes social capital indicators – amongst others also a resource generator. My descriptive results indicate that individuals active in voluntary associations access more social resources than inactive individuals do. The investigation corroborates my hypothesis that resource provision depends on the type of association in which an individual is involved. Multilevel analyses show that activity in bridging associations comes along with a broad range of accessed resources. Focusing on

bonding associations, the division of apolitical (e.g. elderly leisure associations) and political associations (e.g. trade unions or professional organizations) allows a deeper insight. The analysis shows that individuals active in political bonding associations do not feature

higher social capital access than those individuals, which are not active in such. However the activity in apolitical bonding associations turns out to be a valuable source of social resources.

## **Friends in Protest: A Social Network Analysis of the NO-TAV Movement on Facebook**

**Giuseppe A. Veltri**, University of East Anglia | [g.veltri@uea.ac.uk](mailto:g.veltri@uea.ac.uk)

Social media, such as Facebook, open up new platforms for social movement to mobilise individuals and coordinate actions at the same time creating a potential insightful set of data that help us understand their internal structure and functioning. In this study, the 'NO-TAV' movement - an Italian protest movement against the realisation of the Turin-Lyon high-speed train connection with a high national visibility- is analysed using a large dataset from their Facebook platform. Applying social network analysis, the study uses both vertex and group network metrics to understand information flows based on co-comments of posts and of cultural

homogeneity based on co-likes. Facebook data are used to build two user-to-user large unimodal networks of members of the group, one based on co-comments and the other on co-likes of posts. Exploring additional network structural features of this movement and testing hypotheses derived from the 'new social movements' scientific literature, this study is one of the first attempts of using Facebook 'fan-page' data for social science research purposes. Last, implications for modelling the diffusion of innovation and information starting from the obtained network parameters will be discussed.

## **a05RN21 - Mixing Methods: Moving beyond the Quantitative-Qualitative Divide II**

Chair(s): Jolanta Matgorzata Perek-Białas (Jagiellonian University)

### **The Multidimensional Nature of Islamophobia. A Mixed Method Approach to Construct an Appropriate Scale.**

**Wolfgang Aschauer**, University of Salzburg | [wolfgang.aschauer@sbg.ac.at](mailto:wolfgang.aschauer@sbg.ac.at)

**Elisabeth Donat**, University of Salzburg | [elisabeth.donat@sbg.ac.at](mailto:elisabeth.donat@sbg.ac.at)

Islamophobia is an emerging comparative concept in prejudice research and represents "indiscriminate negative attitudes or emotions directed at Islam or Muslims" (Bleich, 2011, p. 1581). A number of scales on attitudes towards

immigrants exist from relevant cross-national research projects (ESS 2002) and surveys among the population (ALLBUS, 2006), whereas an empirically sound evaluation of Islamophobia is still in its infancy. In an

ongoing research project we aim to construct a differentiated scale based on 16 in-depth qualitative interviews. These interviews consist of a biographical section as well as a photo-elicited part exploring various dimensions of potential Islamophobic thoughts towards Muslim symbols (e.g. the veil, minarets and terrorism) and areas of potential threats (e.g. demographic scenarios, integration in schools, Muslims eroding the own culture). After a narration analysis of the interviews we aim to figure out the main dimensions of the multifaceted perceptions towards Muslims. We then follow the full process of Likert scaling

which involves pretesting a long list of items (student samples), reducing the items to an appropriate scale (based on item analysis) and testing the factorial structure and reliability of the items (based on a quota sample of the local population of Salzburg). The mixed method design adopted in this project can be seen as a pioneer approach for scale constructing. It stands for a deeper integration of the life worlds of the locals and represents an empirically grounded approach with regard to the extraction of relevant dimensions and selection of appropriate items to measure the multidimensional nature of Islamophobia.

## **The Construction, Representation and Reception of Findings in Mixed Methods Research: An Example from Youth Transition Research**

**Nora Gaupp**, German Youth Institute | [gaupp@dj.de](mailto:gaupp@dj.de)

**Herwig Reiter**, German Youth Institute | [reiter@dj.de](mailto:reiter@dj.de)

Mixed methods research produces findings by connecting one or more theoretical propositions with several empirical observations that are usually based on different methodical and methodological approaches. The paper complements this perspective by reflecting the process of constructing, representing and receiving findings from mixed methods research on the basis of a youth transitions study that combines a longitudinal survey with qualitative interviewing. The paper traces these three steps of knowledge production on the level of both individual cases and aggregation. By

following a single case, which was part of the quantitative and qualitative steps of data collection, analysis and interpretation, we take a closer look at the inside of producing findings and the way they are communicated in terms of more or less descriptive or abstract accounts and models. In order to frame the discussion analytically we borrow the heuristic distinction between pragmatic, semantic and syntactic programmes of explanation from Abbott (2004, *Methods of discovery*). We conclude by discussing the benefits of such an analytic distinction for the integration of findings from mixed methods research.

## **Studying Chance: Capturing the Role of ad hoc Social Interactions in Migrants' Transnational Social Networks**

**Nataliia Gladkova**, Maastricht University | [n.gladkova@maastrichtuniversity.nl](mailto:n.gladkova@maastrichtuniversity.nl)

**Valentina Mazzucato**, Maastricht University | [v.mazzucato@maastrichtuniversity.nl](mailto:v.mazzucato@maastrichtuniversity.nl)

When collecting migrants' life stories, researchers often report on the role of chance encounters in influencing the way a migration trajectory took shape or how migrants have

managed their livelihoods in a new country. Aside from reporting on such encounters, however, little has been done by way of theorizing on and systematically studying the

role of chance. This paper aims to make a first attempt at theorizing the role of chance encounters in the migration process by bringing to bear insights from social cognitive theory where spontaneous or ad hoc social interactions have been theorized. This theory has been used in psychology, career counseling and gambling research but has remained separate of migration studies. Secondly, the paper will reflect on the methodological implications of chance encounters in analyses of migrants' personal transnational social networks and suggests ways to identify and study social interactions

brought about by chance. Network studies tend to capture lasting relationships be they weak or strong. Yet how can ad hoc social interactions that are usually short in duration but may have a lasting impact be researched? We propose a methodological approach that consists of systematic collection and visualization of network data combined with qualitative, in-depth interviews and observations. The paper makes use of some evidence collected with the help of mixed-method techniques amongst 46 African migrants in Ukraine.

## **Petri Nets as Semi-Quantitative Process Models: A Policy Analysis of Smoking Bans**

Georg P. Mueller, Univ. of Fribourg | [Georg.Mueller@Unifr.ch](mailto:Georg.Mueller@Unifr.ch)

Petri nets were originally developed in order to describe in a special graphical "language" parallel processes in computers and other automata. This paper explores the features of Petri nets, which are essential in order to use them in sociology for the analysis of public policies like health protection or poor relief. The toolkit resulting from this methodological investigation contains on the one hand qualitative elements from classical network analysis, like nodes and relational arcs. On the other hand, the investigation of social processes with Petri nets also requires quantitative elements like triggers and inhibitors of processes, which are activated by transcending numerical thresholds. Hence

social modelling with Petri nets is based on a mix of structural case studies and statistical analyses. For illustrative purposes, the author presents a comparative analysis of the smoking-bans and -restrictions, which many European governments put into effect between 1990 and 2010, in order to prevent their national populations from passive smoking. The paper shows the structural design process as well as the calibration and validation of the model with quantitative and qualitative international data from the WHO and OECD. It turns out that the proposed semi-quantitative analysis of partially dependent parallel processes is indeed very fruitful for the study of public policy.

## **b05RN21 - Mixing Methods: Moving beyond the Quantitative-Qualitative Divide I**

Chair(s): Andrea Breitenbach (University of Frankfurt)

### **The Effect of Data-Collection Methods in Studying the Finnish People's Attitudes toward Sexual Violence**

Marianne Silén, University of Lapland | [marianne.silen@ulapland.fi](mailto:marianne.silen@ulapland.fi)

Suvi K. M Ronkainen, University of Lapland | [suvi.ronkainen@ulapland.fi](mailto:suvi.ronkainen@ulapland.fi)

The majority of the discussion on the effects of sampling bias has been concentrated on statistical and technical issues. There is, for instance, large number of researches on how to correct statistically, by weighting, the non-response rate and how to make the data more representative. Less is known how data collection techniques and self-selection together 'invite' differently respondents and therefore also effect to the picture the research gives about general opinions. The question is important since the idea of active citizenship and listening to the public opinion has become important part of the political governance and NPM. In our presentation we will describe the results of a study that

compared three data-gathering methods: 1) nation-wide, representative survey (paper-pencil-questionnaires) 2) open web questionnaire, 3) face-to-face interviews in public places like shopping centers and libraries (Mall Intercept Interviews). The research questions are: 1) how do the respondents differ ? 2) How do the results differ? Do the different data-collection methods that invite differently people to take part to the research also end up to the different picture on 'public opinion'. Should the idea of mixing methods also be applied while doing quantitative research? At the end we will discuss about the political use of survey results and the idea of active citizenship.

### **Combining Tools for Social Research as a Strategy for Better Understanding the Users of Virtual Environments**

Rodolfo Martínez Gras, University of Alicante | [rodolfo.martinez@ua.es](mailto:rodolfo.martinez@ua.es)

The development, dissemination and introduction of Information and Communication Technologies (ICTs) into almost all areas of daily life have encouraged the appearance of new virtual environments and areas. These new virtual spaces include the now traditional website, a characteristic feature of Web 1.0, where the user has a predominantly passive role, and the new services of Web 2.0, such as wikis, blogs and Social Network Sites (LinkedIn, Facebook, Twitter, etc.), where the user's level of active participation is essential. The continual

appearance and development of such new virtual environments and related services mean that specific research techniques must be used in order to enable us to understand the profiles, preferences and habits of the members of these new virtual environments. This paper describes the main research techniques that are available for a better understanding of different aspects relating to the user population of a specific virtual environment. They are listed and those that are currently most used by virtual community researchers are described, including: analysis

of web log files, which collect information on server traffic, and the features of the web-based, self-administered survey. The article discusses the strengths and weaknesses of these techniques and aims to demonstrate that

by combining them to complement each other, the most appropriate research strategy can be achieved for obtaining optimum results and for understanding the users of virtual environments.

## Value Determined Attitudes in Time of Crisis Researched through Mixed Methods

Michaela Smidova, Charles University, Prague | [smidovamichaela@seznam.cz](mailto:smidovamichaela@seznam.cz)

Martin Vávra, Charles University, Prague | [martin.vavra@soc.cas.cz](mailto:martin.vavra@soc.cas.cz)

Tomáš Čížek, Faculty of Social Sciences, Charles University, Prague | [t-cizek@volny.cz](mailto:t-cizek@volny.cz)

Attitudes of majority towards marginalized or minority groups always worsened in critical historical periods of European civilization and sometimes led to disastrous results. And as has been shown many times attitudes towards these groups are largely determined by relatively stable value structures, both on individual and societal levels. In our research we are trying to find out what influence has the current crisis on these attitudes and how they are related to value structures. In general, both quantitative and qualitative sociological research on values and attitudes has more or less traditional methodological and interpretational limitations. On the quantitative research these include, e.g. respondent's positioning to all issues, strict borders of closed questions and impossibility to reach respondent's "real" understanding of questions. An interpretational problem of

qualitative research is mainly linked to the generalization, i.e. limited reliability of findings. We examine values of Czechs and of other Europeans and their relation to attitudes towards chosen groups (homeless and foreigners) through secondary analysis of relevant surveys (EVS, ESS, ISSP) where batteries of questions based on different value research concepts (Inglehart, Schwartz, etc.) are included. In our project we enrich this quantitative analysis with qualitative interviews, which are based on formulations from questionnaires of above mentioned surveys. We assume this approach allows mutual data comparability and interconnection. The results of our research mainly contribute to the debate on the use of mixed methods as a research approach that can lead to a deeper interpretation of data and better exploration of the research topic.

## Exploring the Meaning of Left-Right Identifications in Poland 2012

Tadeusz Szawiel, University of Warsaw | [szawiel@uw.edu.pl](mailto:szawiel@uw.edu.pl)

The standard method of measuring left-right identifications is self-placement scale (10 or 11 points) used in surveys on representative samples. According to this method ideological self-identifications in Poland: a) Appear to be a good predictor of voting behavior b) The ideological self-identification of the political parties' electorates is astonishingly stable over time; c) Perceptions of the political parties along the left-right dimension are also very

stable over time: the political parties are very consistently perceived in the left-right space by their own electorates, by electorates of other parties, and the general public But "in itself" the self-placement says nothing on the meaning of "left" and "right". The research from 2012 uses the additional methods to reveal the meanings: a) It uses the correlation analysis to establish the social basis of left and right identifications. b) It directly explores the

meanings by using the complex scheme of open-ended questions. The analysis reveals that majority of those who self-placed themselves on the left-right scale are able to present a consistent substantive description of left or right identifications (their own and their ideological adversaries); it also reveals that the “center” identification category does not mean

“the escape to the center”, for those without political views who are unable to acknowledge that, but means a substantive centrist views and attitudes. c) It supplements the above results by analyzing the findings of Focus Group Interviews differentiated regionally, by age, and level of education.

## 06RN21 - Teaching Quantitative Methods

Chair(s): Henning Best (University of Frankfurt)

### Embedding Quantitative Methods in Social Science Teaching: Tackling the 'Crisis' and Opportunities for Change

Sin Yi Cheung, Cardiff University | [cheungsy@cardiff.ac.uk](mailto:cheungsy@cardiff.ac.uk)

Carole Sutton, Plymouth University | [csutton@plymouth.ac.uk](mailto:csutton@plymouth.ac.uk)

Malcolm Williams, Cardiff University | [WilliamsMD4@cardiff.ac.uk](mailto:WilliamsMD4@cardiff.ac.uk)

In the UK quantitative methods (QM) in sociology degrees is not considered an essential part of the curriculum. Students often view the discipline being closer to humanities than science (Williams et al. 2008). Unlike psychology and economics degrees, entry qualification does not include mathematics or statistics. In most undergraduate sociology programmes, quantitative research and statistics are only taught in standard Research Methods modules. The norm is two 20-credit modules delivered in the first and second year, with at least 50% of the content devoted to qualitative methods. In other words, very limited curriculum space is available for quantitative training at the undergraduate level. In this paper we discuss the strategies of increasing curriculum space and embedding quantitative teaching in

substantive modules. Students taking compulsory Research Methods ‘do numbers’ because they have to, not because they wanted to. In contrast, teaching quantitative methods in optional substantive sociology modules can avoid this ‘motivation’ problem. In our QM embedded module on Race and Ethnicity, students learn about operationalization of theoretical concepts and measurement issues in survey research in context. The use of real data and real world research also breathes life into the ‘dry’ and ‘dull’ statistics. Through the acquisition of analytical skills and statistical reasoning, students learn how to ask interesting research questions using statistical analysis. In turn we hope this would increase the number of students using quantitative methods for their final year dissertation projects.

## An Investigation into the Impact of Visual Teaching and Learning Strategies on Undergraduate Student's Self-Reported Experience of Quantitative Research Methods Teaching

Paola E Signoretta, Loughborough University | [p.e.signoretta@lboro.ac.uk](mailto:p.e.signoretta@lboro.ac.uk)

Martyn J Chamberlain, Loughborough University | [j.m.chamberlain@lboro.ac.uk](mailto:j.m.chamberlain@lboro.ac.uk)

John Hiller, Loughborough University | [J.Hillier@lboro.ac.uk](mailto:J.Hillier@lboro.ac.uk)

This paper discusses the current progress and findings of a two-year Economic and Social Research Council (ESRC) funded project investigating the evidential base for the commonly held assumption that adopting a visual approach to the teaching of quantitative research methods for social science students serves to enhance their teaching and learning experience in addition to the quality of their learning outcomes. It does this against the background of a well-known concern with the standard of the statistical literacy and general quantitative data management and analysis skills, of graduates in the United Kingdom (UK). The project utilizes a pre/post-intervention experimental research design, Baseline data are collected from students

concerning their perceptions and attitudes toward quantitative teaching alongside their confidence in completing core statistical tasks, Comparative data are collected after students complete a quantitative teaching module (the experimental intervention) that emphasizes a visual approach to teaching and learning quantitative research methods. The paper outlines project findings from baseline pre-intervention data collection as well as outlining the proposed intervention - the new quantitative module. Project activity and findings will be of interest to higher education institutions in both the UK and worldwide as they seek to enhance the teaching of quantitative methods.

## New Methods to Teach Statistics

Andrea Breitenbach, Goethe University, Frankfurt | [a.breitenbach@soz.uni-frankfurt.de](mailto:a.breitenbach@soz.uni-frankfurt.de)

Many students have a sense of dread instead of joy when attending lectures about methods of quantitative social research or statistics. Moreover, failing these courses often leads to dropping out of their studies; at the same time it is known that the increase in teaching quality contributes to the decrease in student drop-outs. This paper attempts to conceptualize practice-oriented lecture types so as to make statistics more vivid and increase the quality of teaching. It is in part a project of the new Center of Methods in Social Sciences in Frankfurt, which aims to substantially improve method education. The main emphasis of this paper rests on developing a new concept for statistic courses with the aid of pedagogic concepts on the basis of mathematics- and e-

learning didactics. An attempt is made to implement new teaching forms and develop further learning opportunities. Statistics courses can often only be offered as a lecture with a high percentage of frontal teaching. Courses are complemented by new forms of teaching so as to improve the teaching quality and educational success. Important elements are e.g.: feedback methods. Further components are the development of new practice formats for the lecture session and teaching platform. Preliminary courses are conceptualized, which are available online and tutors are specifically trained according to the needs of the students. The evaluations, developed by the executive department, are used to assess teaching- and learning success,

which integrate both students as well as teachers. Thus, this paper strives to fill a gap by providing statistics education with a

didactical and practice-oriented concept and thereby contributing to important changes in method teaching.

## Engaging Innumerate UK Social Sociologists with Quantitative Methods

John MacInnes, University of Edinburgh | [jmaciuk56@gmail.com](mailto:jmaciuk56@gmail.com)

British sociology journals are dominated by non-quantitative work, and 'quants' is utterly marginal to the life of most UK university sociology departments. Quantitative work is mostly done in specialist research institutes. Drawing on Platt (2012) MacInnes (2009) and other sources I discuss the two roots of this bizarre situation: the peculiarities of UK school maths education and the meteoric expansion of university sociology in the late 1960s. I then look at (1) the efforts currently being made to improve QM teaching at undergraduate, postgraduate and postdoctoral level in UK

sociology; (2) some of the lessons about effective QM teaching that might be drawn from them; (3) the worryingly low level of methodological skill of many university Sociology faculty in the UK, and (4) the need to challenge the privileged role that (what passes for) 'theory' has come to assume within the discipline. I suggest that finding sociologists and other social scientists to fill the fifty new university posts specializing in quantitative methods being created by the Nuffield/ESRC/HEFCE programme later this year will be challenging.

## c07RN21 - Quantitative Methods (Open Topic) II

Chair(s): Henning Best (University of Frankfurt)

## Cluster Analysis with Restricted Cluster Sizes and the Identification of Falsifications

Nina Storfinger, University of Giessen | [nina.storfinger@zeu.uni-giessen.de](mailto:nina.storfinger@zeu.uni-giessen.de)

Peter Winker, University of Giessen | [peter.winker@wirtschaft.uni-giessen.de](mailto:peter.winker@wirtschaft.uni-giessen.de)

The paper deals with a substantial problem in the survey process, namely the identification of fabricated interviews. Previous research showed that a cluster analysis might be the appropriate way to separate cheaters from honest interviewers. But as usual in statistical analyses two different types of errors occur: false positives (honest interviewers classified as cheaters) and false negatives (overlooked falsifiers). First results showed that a cluster analysis reveals a substantial share of falsifiers but mostly at the cost of a high share of "false alarm" (false positives). Consequently,

we propose a (a priori) restriction of the size of the "falsifier-cluster" which will be increased sequentially. In doing so we could assess whether the share of false positives is smaller at the beginning of the procedure and whether a point of saturation might indicate the actual number of falsifications in the sample even more precisely than a unrestricted cluster approach. We realise this idea by a heuristic optimization approach based on the threshold accepting algorithm. Additionally, we compare our results with the performance of a hierarchical cluster method without cluster

restriction. The datasets used for this analysis are mostly collected within the framework of a research project funded by the German Research Foundation. First results show that the restriction of the cluster size promotes in

fact a very low share of false alarm at the beginning. Further, the modified cluster procedure outperforms the hierarchical method regardless of the cluster size, even at the point of saturation.

## **Who Refuses to Answer the Question about the Income and How Can We Reduce the Item Non-Response Bias by Using the Propensity Score Adjustment? The Case Study of Hungary and Poland in the European Social Survey Round 4**

Piotr Jabkowski, Adam Mickiewicz University, Poznań | [pjabko@amu.edu.pl](mailto:pjabko@amu.edu.pl)

The main goal of this presentation is to find out whether the refusals to question of income are random or not as well as how can we eliminate the effect of item non-response in point estimation. Firstly, using the Hungarian and Polish data set of ESS 2008, it will be demonstrated that the likelihood to refuse is not random, but rather proportional to the declared level of income. In this part of presentation I will introduce the basic principles of propensity score adjustment (PSA) as a weighting scheme (see Matsuo et al. 2010, Lee 2006). This procedure is normally based on the logistic regression, but I will demonstrate the usefulness of a credit-scoring model for such purposes. In fact it is also based on logistic regression, but it helps to choose the relevant set of predictors as well as to illustrate and understand the nature of

income refusals. In the second part of the presentation, based on the data from the "Polish General Social Survey", an assessment will be provided how PSA helps to reduce the income item non-response bias. By removing the known values of income I will consider three patterns of missingness: the random one, the systematic one without 10% of the lowest income values and the systematic one without 10% of the highest values. By contrasting PSA and post-stratification weighting (PSW), it will be demonstrated that PSA is much more effective when missingness mechanism is systematic, however PSW is slightly more effective when non-response is random. In fact, PSA increases variance a little bit more than PSW, but PSA decreases bias much more efficiently than PSW, so PSA implies much smaller total survey error.

## **Mapping the UK Social Space: Toward a Bourdieusian Class Scheme**

Will Atkinson, University of Bristol | [w.atkinson@bristol.ac.uk](mailto:w.atkinson@bristol.ac.uk)

For those who, following Pierre Bourdieu, conceive social class in terms of economic, cultural and social capital, the most widely used and officially sanctioned class schemes available for statistical analysis – the NS-SEC in the UK and the derivative ESeC on the European level – are hardly satisfactory, primarily because, being based on broadly Weberian principles, they fail to distinguish the pertinent dividing lines of capital in 21st Century Western societies. Existing statistical

efforts by British Bourdieusians, however, are far from adequate either since they either still rely on the NS-SEC or fail to produce a set of categories usable by others in further analysis. This paper reports on an effort to push beyond this impasse by charting the UK social space via secondary investigation of large-scale governmental datasets on pertinent capitals and distilling from it a usable set of categories to act as a new class schema. Interesting differences from and similarities with

Bourdieu's own model and method in *Distinction* will be discussed, as will preliminary investigations of the homologies between the social space, the symbolic space

of lifestyles and the space of political position-takings using multiple correspondence analysis.

## Lessons Learned: Probing in Cross-National Web Surveys

**Katharina Meitinger**, GESIS Leibniz Institut for the Social Sciences | [katharina.meitinger@gesis.org](mailto:katharina.meitinger@gesis.org)

Due to the growing significance of international studies, the need for tools to detect interpretation differences of items in international surveys is pressing. Cognitive interviewing supplements statistical procedures in revealing problems of non-equivalence and offers at the same time the possibility to identify their causes. Despite its general usefulness, its application in a cross-national context is limited so far. This is partly due to several drawbacks of cognitive interviewing, like small sample sizes or the limited availability of adequately trained interviewers in some countries. The project "Enhancing the Validity of Intercultural Comparative Surveys: The Use of Supplemental Probing Techniques in Internet Surveys" proposed the application of probing questions in cross-national web surveys as a

solution to these shortcomings, e.g. it allowed an inexpensive increase in sample size by using online panels. In total, one national and two cross-national studies were conducted in 2010/2011 to assess the value of probing questions in web surveys as a tool to evaluate cross-national validity of items. As the project came to an end, the most important outcomes of this study can be summarized. The project set out to develop a method to use cognitive probing questions in web surveys. We report on factors that influence the answer quality, e.g. context/design effects. Another goal of this study was the testing of the approach with substantive topics in international surveys. Illustrated by different probed items we present the potential of probing in web surveys and indicate remaining research gaps.

## The Influence of the Response Format on Likert-Type Items.

**Maria do Carmo Botelho**, ISCTE-IUL, BRU-IUL, Lisbon | [maria.botelho@iscte.pt](mailto:maria.botelho@iscte.pt)

**Madalena Ramos**, ISCTE-IUL, CIES-IUL, Lisbon | [madalena.ramos@iscte.pt](mailto:madalena.ramos@iscte.pt)

**Teresa Calapez**, ISCTE-IUL, BRU-IUL, Lisbon | [teresa.calapez@iscte.pt](mailto:teresa.calapez@iscte.pt)

In 1932, Likert proposed a measurement method that forever changed the role of quantitative methods in social research. Likert advocated the use of statements, so that people with different positions in the attitude under study respond differently, each being scored on a rating from one to five according to the respondent's level of agreement with the statement. The measure of attitude is obtained by summing the scores of the selected items. Since then, several alternative formats of

responses came to be suggested. The proposals relate both to the number of points used, as to the verbal descriptors included (description, quantity, and positioning replacing a finite set of options by a continuous line [visual analogue scales, VAS]). The objective of this field based work is to study how different presentations of Likert-type items (including "continuous" options, i.e. marking the option on a straight line, with or without middle point and the use of all anchors vs extreme-only

labels) reveal differences in the results. For this purpose 18 items covering beliefs regarding mathematics were chosen. Participants were first year, first time students of several courses. There were four types of questionnaires: continuous, extreme-labelled scale, with a middle mark (type A); continuous extreme-labelled scale, with no middle mark

(type B); 5-point all-labelled Likert-type items (type C); and 5-point extreme only labelled Likert-type items (type D). In this paper we will present the results of comparing the responses item by item and also the scales obtained by the sum of the respective items theoretically defined.

## e07RN21 - Quantitative Methods (Open Topic) I

Chair(s): Heinz Leitgoeb (Johannes Kepler University)

### Interviewers Attitudes towards Surveys, Interviewer Experience, Locus of Control, Personality and the Impact on Co-Operation with CATI-Surveys

Volker Huefken, University of Duesseldorf | [volker.huefken@phil.hhu.de](mailto:volker.huefken@phil.hhu.de)

We examine the effects of interviewers' experience, interviewers co-operation related locus of control, attitudes towards surveys, and personality traits on interviewer performance in terms of the likelihood of refusal in a cross-sectional telephone surveys. Previous studies of the association between co-operation and interviewer skills and interviewer attitudes have not directly addressed the role on CATI-

surveys. We use 250 interviewers and analyse co-operation outcomes for over 15,000 cases. We find evidence of effects of experience, attitudes and personality traits (e.g. extraversion) on co-operation. The implication for survey practice for example, it might be useful to administer a personality test and obtain the applicant's score on the extraversion dimension.

### Estimating Societal Trends from Cumulated, Harmonized, Cross-National Survey Data – The Case of Church Attendance Trends in Europe

Markus Quandt, GESIS Leibniz-Institute for the Social Sciences | [markus.quandt@gesis.org](mailto:markus.quandt@gesis.org)

Ferruccio Biolcati-Rinaldi, University of Milan | [ferruccio.biolcati@unimi.it](mailto:ferruccio.biolcati@unimi.it)

Cristiano Vezzoni, University of Trento | [Cristiano.Vezzoni@unitn.it](mailto:Cristiano.Vezzoni@unitn.it)

Sample-based social science surveys have initially been a tool to collect data for analyses with a limited time-horizon. With the advent of long-standing programmes such as Eurobarometer, ISSP, EVS/WVS, and ESS, the option of deriving society level trend information from cross-sectional data has come into the world. Only if we can trust that such aggregates are robust against

methodological peculiarities in the measurement process, we can proceed to use these sources to identify disruptions in trends such as crises might bring about. The presentation therefore explores the vulnerability of survey-based trend data to biases introduced by some relevant components of survey error. A database of responses to church attendance questions in

European surveys, compiled from the survey programmes listed above, is analysed with respect to possible problems arising from the requirements of harmonisation, given a variety of languages, question and questionnaire formats, and other design properties of the individual surveys. The database presently comprises more than 800 time/country samples from 32 European countries or regions and covers almost all years from 1986 to 2010. The analyses will identify aberrations of samples from trend patterns and investigate

possible methodological factors behind such aberrations. The results will enable us to identify outliers in the measurement of society level estimates of church attendance figures. Further, the study may ultimately contribute to answering such questions as what the effects of different response formats, sample designs, modes etc. on reported average attendance levels are. Among these, the current paper will focus on issues in the harmonisation of question formats.

## On the Question of the Reasons of the World Financial Crises: The Model of the Manageable Crises

Stepan S Sulakshin, Governance and Problem Analysis Center | [frpc@cea.ru](mailto:frpc@cea.ru)

The problem of causes of economic crises was and remains one of the scientific challenges of high importance. The multitude of hypotheses about the origins of crises can be reduced to four basic theories (models) - stochastic, cyclic, overproduction theory and the theory of the manageable crisis. The comparative analysis of traditional explanatory theories shows that they cannot fully characterize the causes of the crisis. Since the theory of manageable crisis which reveals the mechanism of the crises and explains their nature is introduced. The author put forward a model of the manageable crisis based on a number of hypotheses that are verified using the statistical data: a) the same mechanism of the controlled cyclical crisis dominates historically; b) understanding of the mechanism of crisis management (the motives

of his beneficiaries and their actions) allows predicting new crises; c) it is possible to advise the international community on the question of overcoming the crisis. The methodology of scientific evidence includes the following. 1. Introducing the concept of the standard cycle of the financial crisis and its statistical "portraiture." 2. Analyze of causal interdependent parameters of stability through time lags. 3. Identifying stable motives and interests of persons to manage the crisis. The author believes that the crises develop in the framework of a three-phase cyclic model. The fall of the profits of a group of the beneficiaries of the world economic system makes them take measures to restore them, what leads to crisis. After the profitability is restored the crisis is overcome.

## The Analysis of The Data in Non-Linear Sociology

Mikhail Basimov, Kurgan State University | [basimov@mail.ru](mailto:basimov@mail.ru)

Synergetic style of thinking is a style of thinking of a postnonclassical science. "Non-linearity" is a fundamental conceptual unit of a new paradigm. The non-linear sociology is a new approach to studying of the social phenomena. Research of any social phenomena

will be artificially extremely simplified and narrowed by external frameworks if the researcher investigating the multivariate social phenomenon will remain only within the framework of linear representations. We offer the new approach to understanding of the

concept of statistical relation in sociological research, that gives use of the author's method of multiple comparison for quantile splittings of the data set (objects) on each measured sociological parameter. Thus, it is necessary to refuse meaningfully preliminary promotion of a hypothesis about the form of the dependence (linear or any other concrete non-linear dependence). That is, the method allows to determine for an investigated matrix of the data both the form of dependences, and a degree of their expressiveness on various pieces of test scales in the unified system of measurement of achievable norm of factors of

the connection strength resulting the analogues of individual correlation (a self-dependence of the parameter) accept values close or equal an unit. We will consider in the report an idealized mathematical problem where each parameter represents values of one of elementary functions in an interval symmetric about zero, with an even stride of argument, applying the algorithm of multiple comparisons for 36 functions which values are divided into quarters. Functions for convenience of splitting into quarters are either monotonous in a considered interval of argument, or even  $[z(-x)=z(x)]$ .

## Revealing of Ethnos' Psychological Character Methods.

Choduraa Saryg-Khaa, Tuvan State University | [schoduraad@yandex.ru](mailto:schoduraad@yandex.ru)

The author's concept on research of ethno psychological character of the ethnos and its structural components has been developed by professor E.N.Reznikov and approved by scientists of Tuva. For revealing of psychological characteristics of Tuva ethnos, there has been carried out empirical research and comparison auto – and heterostereotypes on the basis of the above-named technique. The methods of professor Reznikov is based on 3 level concepts of ethno psychological characteristics. 1st level – valuable orientations is included by two components. 2nd level – relations to the surrounding reality include 16 components (relations of representatives of ethnos among themselves, family relations, labor relations, behavioral features and others). 3d level – features of mental processes, conditions and properties

(national feeling, sense of humor, mood in different spheres of ability to live, feature of perception, thinking and speech, tolerance and temperament). The method includes about 900 indicators. The estimation is spent on a 5-level scale (from is very seldom shown -1, to is very often shown - 5). It is processed by means of mathematical methods in psychology. It is revealed auto – and heterostereotypes by the results of research. Typical character traits and qualities of the person Tuva ethnos are hospitality, respect for seniors, politeness. The obtained data can be used not only in the theoretical plan, but also in the applied. They can be used for example, in the organizations of population management, at regional and municipal levels and in the preparation of citizens for international dialogue.

## a08RN21 - Survey Sampling

Chair(s): Henning Best (University of Frankfurt)

### Analyses in the Flawed Application of the Birthday Method in Telephone Surveys

Marek Fuchs, Darmstadt University of Technology | [fuchs@ifs.tu-darmstadt.de](mailto:fuchs@ifs.tu-darmstadt.de)

Dennis Schumacher, Darmstadt University of Technology | [schumacher@ifs.tu-darmstadt.de](mailto:schumacher@ifs.tu-darmstadt.de)

The birthday method is a standard procedure for random selection of respondents within households. Even though common wisdom suggests that respondents have difficulty understanding the mechanism, it is a simple and time-efficient method from the researcher's point of view. Prior studies in the USA and other countries have demonstrated that the selection is not always properly applied and subsequently leads to deviations from random selection of respondents. The few published studies suggest deviations in respondent selection in about 20 to 25 percent of the cases. These studies have predominately assessed the interviewers' responsibility for a flawed selection of respondents. In this presentation we report results from two landline telephone surveys in the general population in Germany that aimed to explore the contribution of gatekeepers and respondents to an erroneous application of the

birthday method. Since interviewers were supervised and audio-recorded during the introductory phase of each interview, we were able to identify errors in respondent selection caused by the persons answering the phone. The respondent selection was verified using birthday information for all household members collected in the sociodemographic section of the questionnaire. Thus, we were able to assess whether the selected respondent has in fact been properly selected. Results suggest that respondent selection was not appropriately conducted by respondents or gatekeepers in 18 percent of the cases. In the presentation we will describe the mechanisms and patterns leading to the flawed respondent selection and assess potential bias in sociodemographic and substantive estimates caused by the erroneous application of the birthday method.

### Who is Your Neighbour? Sampling of Migrant Populations Using Population Clustering.

Inna Becher, Federal Office for Migration and Refugees, Nuremberg | [inna.becher@uni-konstanz.de](mailto:inna.becher@uni-konstanz.de)

In absence of high quality sampling frames for migrant populations, many special approaches have been developed. Recently, survey research literature is focused on chain-referral or network procedures. One of them - adaptive sampling (e.g. see Thompson 1996) - not only allows for cost-effective sampling but also for statistical inference from these samples. Only little is known about the usability and properties of such adaptive

procedures in the German context. Therefore, we simulate adaptive sampling for migrants in Germany based on a telephone directory containing about 31mio. entries. We simulate two migrant populations of different sizes in the general population in order to evaluate properties of an adaptive sampling scheme for rare and less rare groups. Using Monte-Carlo simulations of adaptive sampling on these populations, mean and variance of survey

characteristics are estimated and compared to simulations of a simple random sample (SRS) from the same sampling frame. Results show that adaptive procedure have many advantages compared to SRS. First, adaptive samples contain about 56% more migrants than SRS of

the same size. Second, estimates from adaptive samples have great precision and consistency even for rare populations. Despite larger effectivity and high precision, there is only moderate gain in effective sample sizes for adaptive sampling compared to SRS.

## 09\_20JS21JS28 - Doing Social Research on Sports. Methodological and Empirical Challenges (1)

Chair(s): Alessandro Porrovecchio (University of Torino), Ajit Singh (University of Bielefeld), Katarina Jacobsson (Lund University)

### Sex Equity in Sports Media: An Invitation to Open a Methodological Discussion

Nicolas Delorme, University Bordeaux Segalen | [nico\\_delorme@hotmail.com](mailto:nico_delorme@hotmail.com)

In the last decades, the media coverage of sport in relation to participants' sex has been extensively analysed in the scientific literature. As one of the most covered international sport competitions, the Olympic Games provide an interesting database for studies investigating differences in journalistic treatment according to athletes' sex. The majority of these studies concluded that women were underrepresented in the media coverage of this event. However, there is an important heterogeneity in how to proceed to determine whether media coverage in relation to athletes' sex is equitable. Therefore, the aims of this study are to determine the most appropriate standards for this comparison and to use them to assess whether there are biases in the journalistic coverage of the Olympics, using data from previous studies ( $n = 18$ ). Equitable media coverage could be measured using a chi-

square goodness-of-fit test in four distinct ways: (a) using the global representation of each sex in the considered Olympics; (b) using the representation of each sex in the considered Olympic team; (c) using the percentage of available events for each sex in the considered Olympics and (d) using the representation of each sex in the number of events for which a given country fields a team/athlete. Results show that media coverage is far from being detrimental to women: they are either equitably represented (28.79%) or significantly overrepresented (46.97%). Indeed, all modalities combined, women are only underrepresented in 22.24% of cases. In most cases, these results significantly differ from those of previous research and stress the importance and the need to take methodological precautions for this type of study.

### Crisis in Body- A Qualitative Insight into a Process of Physical Therapy.

Dominika Byczkowska, University of Lodz | [dominikita@wp.pl](mailto:dominikita@wp.pl)

In the paper there will be presented an outcome of a study on social aspects of embodiment, concerning body in crises after

serious bodily change such as an accident, stroke or during a course of other illnesses. The crises may take various forms- physical

crisis, crisis of self identification, crisis in interactions with close ones, serious changes in everyday life and many other. The process of physical therapy is used as a mean to regain lost skills (e.g. everyday skills, interactional skills); to rebuild lost identities; to become as independent as possible. The general aim of this process is to get back the life that one had before the crisis, as well as possible. The paper discusses also ways of coping and not coping with the crises, ways of reconstructing what was lost in an individual's life, as well as emotions and feelings that appear (like fear or disappointment) or that are no longer present

(like self-acceptance, pride) during the crises. The process of physical therapy will be presented in context of Polish medical care system. In the study there have been used an autoethnography, interview and participant observation as main research methods. I will also compare some of the conclusions with my former study which showed a way of using one's body as a tool of building a dancer's career. In the paper I will set an important question of subjective and emotional commitment of a researcher to a subject of research.

## **Performance in Archery. An Ethnographic Approach to Research the Social Construction of Embodied and Tacit Knowledge in Sports.**

**Christoph Maeder**, Thurgau University of Teacher Education | [christoph.maeder@phtg.ch](mailto:christoph.maeder@phtg.ch)

Archery as an old practice of the humans, which initially was used for hunting and fighting in conflicts, has become domesticated. Nowadays archery is performed mainly as a sport and is even an Olympic discipline. While for the outsider it seems quite obvious what archers do, namely shooting arrows on targets, there is also a more intricate insiders view. In the latter perspective the flying arrow is the product of a complex process of a disciplined body, the use of special artifacts and a correspondingly adapted and specially trained mind. Some of the knowledge to become a successful archer can be expressed verbally. But a lot of the performing competence as a skilled archer can only be gained through

'learning by doing it'. Or "you need to feel it, you need to get the feeling", like some archers say. The production of this feeling refers to embodied and even tacit knowledge necessary to perform in nearly any sport, not only in archery. But how is this feeling socially produced? In my contribution I want to address the question of how we as sociologists can understand, describe and analyze the different forms of knowledge necessary to perform in sports. As an ethnographic case I use the example of archery, where the body, artifacts and the mindset of the performer have to be trained and packed together on different levels: verbally, emotionally and physically.

## **Climbing Walls, Making Bridges: Innovative Methodologies, Embodied Identities, Space & the Cultural Politics of Capoeira**

**Michael L Silk**, University of Bath | [m.silk@bath.ac.uk](mailto:m.silk@bath.ac.uk)

**Nicola De Martini Ugolotti**, University of Bath | [nicola.demartiniugolotti@gmail.com](mailto:nicola.demartiniugolotti@gmail.com)

**Ceri Brown**, University of Bath | [C.L.Brown@bath.ac.uk](mailto:C.L.Brown@bath.ac.uk)

In this paper we explore the ontological, epistemological, axiological and

methodological contingencies at the intersections of identity politics, physicality,

embodiment and space. As a lens through which to consider the researcher/researched body, we focus on our on-going work that addresses the processes by which (marginalized) migrant young people navigate spaces of inclusion and exclusion within the multiple materialities and discursive narratives of urban space. This work centres on the performative body practices of young men between 13 and 20 engaging in capoeira and parkour as it articulates with notions of citizenship, identity, visibility, and the recognition of young geographically transitory people in Italian public life. Addressing identities that are put 'to work' towards a sense of belonging and self worth, we explore the messiness of reflexivity and empirical vulnerability as we engage the body in

redefining the boundaries of knowledge production, performativity, and physicality: a project that we see as productive for the future potentialities of the 'sociology of sport'. We advocate for research that centralises corporeal movement and which is suggestive of an innovative approach that elicits or allows for a fuller exposition of the cultures of the body that are being experienced (Giardina & Newman, 2011). Such an approach is one that can destabilize taken for granted forms of knowledge, makes salient the discursive currents of gender, race, class, ethnicity, religion that converge and permeate cultural spaces/sites, and that ultimately can aid in unlocking the processes of identity construction for migrant young people within spaces of inclusion / exclusion.

### Avoiding Social Desirability Bias by Means of Indirect Questioning

Jens Flatau, Christian-Albrechts University of Kiel | [jflatau@email.uni-kiel.de](mailto:jflatau@email.uni-kiel.de)

Frank Schröder, Otto-Friedrich University Bamberg | [schreder.frank@googlemail.com](mailto:schreder.frank@googlemail.com)

**Introduction** Social desirability bias is a long known but so far only rudimentary solved problem in social survey research. On the basis of a real research example, this contribution demonstrates how this bias can be reduced applying the method of indirect questioning. **Research Problem** Voluntary engagement in sport clubs itself is no reason to be embarrassed for. However, altruistic motives for it like the desire to help others are certainly regarded to be more honourable than egoistic ones like the promotion of one's occupational career. Thus, particularly rational egoistic actors can be expected to hide their true intentions and questionnaire surveys on their prevalence are confronted with the social

desirability problem. Method Fisher (1993) could demonstrate that the social desirability bias can be reduced by indirect questioning. His approach is adapted to the mentioned research project. Besides direct questioning, two sorts of indirect questions are used regarding similar items representing different kinds of motives for voluntary engagement. Firstly, the interviewees are asked what they think the motives of the other volunteers in the club are. Secondly, they are asked to rate their actually gained utility from their engagement, independent from their intentions. **Results** The study reveals high differences between the corresponding items' values, as expected notably between self- and external attribution.

Distinct 'dissonance patterns' can be identified that correlate with socio-economic variables as well as with the temporal extent of the voluntary engagement. References Fisher, R

(1993). Social Desirability Bias and the Validity of Indirect Questioning. *J. of Consumer Research*, 20, 2, 303-315

## Exploring the Validity of 'Sport' as a Sociological Concept.

Susan M. Lagaert, Ghent University | [Susan.Lagaert@Ugent.be](mailto:Susan.Lagaert@Ugent.be)

Henk Roose, Ghent University | [henk.roose@ugent.be](mailto:henk.roose@ugent.be)

In this contribution we raise a number of critical issues about how 'sport' is used as a sociological concept in the current quantitative literature on sports participation. We argue that if 'sport' wants to be an adequate and valid concept in sociology, and in the sociology of culture in particular, two related threats need to be considered and overcome: (1) the adequacy of a conceptual definition should be evaluated also in terms of sport activities as being culturally distinguishing practices, and (2) the validity of its measurement in surveys should be evaluated. Often, definitions of 'sport' one-sidedly focus on physical exertion or competitiveness, which neglects the socially distinguishing nature of specific forms of sports as part of a lifestyle. The phrasing in questionnaires often reflects a specific definition of 'sport', limiting possibilities for analysis. Moreover, it is assumed that 'sport'

has an obviously similar meaning to respondents in questionnaires, cf. the wording in the Eurobarometer (2010): 'How often do you exercise or play sport?' Yet, different types of respondents may interpret 'sport' in different ways, undermining the validity of its measurement and hence, its suitability for sound sociological analysis. Using data from the survey 'Cultural participation in Flanders 2009' we focus on some of the undesirable consequences of both threats in sociological research. By applying Multiple Correspondence Analysis (MCA), we show that people with different sociodemographic backgrounds differ in their understanding of 'sport', implying that the measurement, as it is used now, lacks validity. Suggestions on how to collect valid data on sport participation are presented.

## The Interactive Construction of Sport/Illness Life Histories of Chronically Ill People. An Innovative Approach to Study the Meaning of Sport in Times of Health and Illness.

Mirjam Stuij, Mulier Institute | [m.stuij@mulierinstituut.nl](mailto:m.stuij@mulierinstituut.nl)

Agnes Elling, Mulier Institute | [a.elling@mulierinstituut.nl](mailto:a.elling@mulierinstituut.nl)

People's personal sporting behaviour and attitude towards sport and physical activity are related to one's individual sporting biography and experiences as well as to broader social conditions, perceived expectations and constraints. Influential life events like illness may influence both people's actual and future sporting behaviour and the meanings given to

sport and physical activity. Besides an individual process, this is also a cultural and socio-political one, in which patients can accept, negotiate with or resist the most prominent types of success stories ("recovery through sport") as well as the most prominent health discourse ("sport is good for health"). Our study focuses on the (interactive

construction of) narratives around sport, physical activity and health of people with a chronic illness, especially in interaction with their (allied) medical professionals. Therefore, we created a cyclical narrative design where the emphasis is on encounters of different story lines of patients and their professionals. We use a mixed methods design in which we combine surveys among patients, interviews with (allied) medical professionals,

sport/illness life histories of patients and ethnographic studies in medical settings. Based on three different pilot studies, this paper introduces our method of collecting sport/illness life histories of patients, with its strengths and weaknesses, and their different contributions to gaining insight in the co-production, negotiation and criticizing of patient's different sporting bodies, identities and practices.

## RN22 - Sociology of Risk and Uncertainty

### a01RN22 - Risk, Crime and Policing

Chair(s): Efim Fidrya (Immanuel Kant Baltic Federal University)

#### Smart CCTV and the Maximum Security Society – Political Visions and Social Boundaries

Jens Hälterlein, University of Potsdam | [haelterl@uni-potsdam.de](mailto:haelterl@uni-potsdam.de)

Norma Möllers, Potsdam University | [norma.moellers@uni-potsdam.de](mailto:norma.moellers@uni-potsdam.de)

We would like to address risk governance in crime control by illustrating the development and implementation of so called “smart” CCTV systems in Germany. These video surveillance systems are expected to automatically detect deviant behavior by using software algorithms. Since this technology is not based on the psychological or criminological analysis of deviant subjects, but on the analysis of situation and space classified as dangerous, it comes with an expansion of risk perception: everyone who is monitored by these systems is a potential risk. Both, advocates and critics of this technique hence draw a picture of new powers of control, that stretch from terrorism

and ordinary crime to mass events. This vision of a maximum security society yet faces technological problems (how can indexical behavior be translated into software algorithms?), legal restrictions (e.g. data protection guidelines) and the often divergent interests of prospective users (police, public transport, private enterprises). Drawing from a broad empirical study we want to show, that the development of smart CCTV is on the one hand part of a new rational of risk governance in crime control since it comes with a re-coding of risk and security. On the other hand its practical implications correlate with a multitude of social factors.

#### Crime and Securitization in Rome

Maria Grazia Galantino, Sapienza University of Rome | [mariagrazia.galantino@uniroma1.it](mailto:mariagrazia.galantino@uniroma1.it)

Growing fears and demands for security in contemporary cities mirror the emergence of new risks and uncertainties in different realms of social life. Drawing from social science literature on risk and securitization, the paper examines how risks gain public attention and become threats to security, influencing the opinion climate in which policies and actions to address them are legitimised. The public discourse on crime in the city of Rome well illustrates this process. Defined as “the safest city in Europe” in early 2007, Rome was

portrayed as “the capital of fear” by the end of the next year. Indeed, crime and security became the major issue at stake in the 2008 campaign for municipal election and the linchpin of the new centre-right administration. Through content analysis of newspaper articles, the paper examines how the meaning of risk and security changed over time according to the role and the visibility of different policy actors in the public scene. It also reveals how the prevailing definition of the situation can result in security measures that

become institutionalized and taken for granted in the public discourse.

## **Immigration and Crime in Spain, Is There a Link? The Risk for Immigrants of Being Labelled as Criminals in Crisis Times.**

Ana Maria Lopez Narbona, University of Malaga. Spain | [alopeznarbona@uma.es](mailto:alopeznarbona@uma.es)

Immigration and crime in Spain: Exploring the risk of immigrants being labelled as criminals in crisis times. Considerations around managing risk and uncertainty are increasingly relevant to studying linkages between immigration, crime and the governance of migration. Immigrants have no special propensity for crime and deviance and do not threaten the labor market (as a part of the market system as a social construction, Polanyi), yet they are viewed as being intrinsically risky because of their displaced status, the dualization of the labor market, the growth of precarious employment, the dismantling of public assistance programs, the rise of the ghetto as instrument of control of a stigmatized population, and because of a more engrained distrust that becomes the framework for public concerns over immigration. These are all “socially construed” motivations, fears, risks and uncertainties. This paper explores the

underlying mechanisms (and motivations) behind these socially constructed motivations. Cultural theories of risk are applied in considering certain marginalized groups and how they are identified as posing risks to the mainstream community, acting as repositories for fears not simply about certain ‘risks’ but about the breakdown of social order and the need to maintain social boundaries, hierarchies and divisions (Douglas). Risk comes into existence when the hazards which are now decided and consequently produced by society undermine and/or cancel the established safety systems of the welfare state’s existing risk calculations (Beck). The paper considers possibilities for successfully confronting stereotypes such as “criminal immigrant” and the related notions that immigration disorganizes communities and increases crime (or, the threatens that immigrants pose on the labor market, Polavieja).

## **Suspicion and Riskiness: Policing in the Aftermath of the Manchester Riots**

Elisa Pieri, University of Manchester | [elisa.pieri@postgrad.manchester.ac.uk](mailto:elisa.pieri@postgrad.manchester.ac.uk)

This paper critically discusses some of the emergent policing practices adopted in the aftermath of the recent Manchester Riots, and aims to problematise the specific constructions of riskiness underpinning them. As urban unrest spread from London to other UK cities in the Summer of 2011, the paper examines the emergent investigative measures used to identify and apprehend suspects through the ‘Shop a Looter’ campaign launched by Greater Manchester Police. It also focuses on the proactive policing put in place to prevent (further) crime and disorder. The paper looks at the police’s own use of social media, and at

the increased reliance on a set of technologies, databases and networked analytics, from CCTV to forensic DNA technologies and the Automatic Number Plate Recognition system that was used to deploy real time urban exclusion zones. This overview highlights some of the key complexities and ambiguities generated by the integration of such technologies and practices, and by the very constructions of suspicion and riskiness operationalised within them. Finally, this paper considers the implications of these emergent policing practices in relation to issues of legitimacy. It critically reflects on the image

management role performed by these emergent policing practices for the police, and on the mobilisation of a discourse of responsible citizenry and moral disdain

towards disorder, which resulted in the enrolment of certain publics in active surveillance and intelligence sharing with the police.

## **b01RN22 - Risk, Time and Social Theory**

Chair(s): Anna Olofsson (Mid-Sweden University)

### **Re-Assembling 'The Normal' in Neo-Liberal Times - Tracing (New) Closures of 'Normality' in the Age of Risk**

Katarina Giritli-Nygren, Mid Sweden University | [katarina.giritli-nygren@miun.se](mailto:katarina.giritli-nygren@miun.se)

Siv Fahlgren, Mid Sweden University | [siv.fahlgren@miun.se](mailto:siv.fahlgren@miun.se)

The meaning of 'the normal' tends to slide from the valued ideal, to the ordinary (or statistically normal), which is constituted as the opposite of deficiency, deviation or social problem. Between these poles are limitless possible shifts in meaning. The ordinary shifts easily from something neutral (common, perhaps even dull), to something desirable or ideal when it is applied in social situations. Thus the normalization processes are neither innocent nor value free. The notion of "being at risk" is central to the doing of normality in contemporary society. By formulating or creating hazards in a community, 'the normal' becomes re-assembled as not being "at risk", an assemblage that is becoming narrower and more difficult to uphold. By means of the notion of risk, power reaches all aspects of life

through subjective internalization and normalization, but also draws the boundaries between those belonging and needs to be safeguarded against risk, and those whose life is expendable. We argue that who becomes categorized as being "at risk" can tell us a great deal about who qualify as a "normal" citizen, and how this intersect with gender, class, age, and race/ethnicity. Drawing on policy related documents concerning health, unemployment, education and integration our aim of this paper is to explore the doings of "risk" and its joint processes of normalization in terms of gender, ethnicity, age/generation and class-based inequality and discrimination as well as inclusions and privileges within the context of the Swedish welfare state.

### **Risk and Modernity Revisited**

Adam Burgess, University of Kent | [a.burgess@kent.ac.uk](mailto:a.burgess@kent.ac.uk)

Central to how it became of interest to sociology was the notion of risk as a distinctively modern idea that was absent prior to modernity; even the ancients lacked a sense of risk, interpreting uncertainty and misfortune fatalistically. An associated idea in the writing of Beck and Giddens was of risk as an amoral

notion, helping explain its resonance in a late modern world where explicitly moral terms of reference have decreasing impact. Yet these notions have not been developed and even been called into question in recent work uncomfortable with the historical specificity of the idea of risk. This paper will firstly restate

the relevance and interest of historical perspectives on risk, drawing upon recent research that better draws out the transition in outlooks during the early modern period, in particular. Secondly, the paper will suggest a research focus upon risk as a form of 'demoralised' discourse, drawing upon original

research on policy discussion around issues such as pornography and alcohol consumption. The intention is to further reclaim risk as a social rather than technical notion and suggest new and fruitful avenues for future social science research in the field.

## **Experience of Biographical Disruption. Consequences and Risks.**

**Maruta Pranka**, Latvia University | [pranka@latnet.lv](mailto:pranka@latnet.lv)

The paper discusses the connection of biographical disruption with the risk of trauma or even lose of all kinds of individual capitals – financial, cultural, social and symbolic. Dealing with experience of different empirical researches biographical disruption is analyzed in the essentially different situations: 1) hard chronic illness – as breast cancer; and 2) forced migration or deportation. Deportation and hard chronic illness being essentially different processes have common consequences influencing individual identity and biography. Hard chronic illness as well as deportation as biographical disruption cause risks for: individual identity and life course in general, access to different resources, status, family relations, psychological wellbeing, quality and quantity of social networks.

Behavior and life strategy in replay to biographical disruption is various, and biographical risks could be managed according with the individual experience, the social and cultural resources. The data from researches conducted by the biographical approach are analyzed: 1) biographical interviews with 14 breast cancer BRCA1 and BRCA2 gene carriers. The data are obtained in a research project financially supported by the European Social Fund (2009/0230/1DP/1.1.1.2.0/09/APIA/VIAA/070), conducted at Riga Stradins University (2010 – 2012). 2) life stories by persons suffered from deportation in the period 1941-1956. The data are obtained in the frame of National Oral History Project in Institute of Philosophy and Sociology of Latvia University.

## **Habitus and Trust - From an Empirical Problem to a Theoretical Framework of Constrained Choice**

**Patrick Brown**, University of Amsterdam | [p.r.brown@uva.nl](mailto:p.r.brown@uva.nl)

This paper starts with a research conundrum - people with diagnoses of psychosis who refer to being 'too trusting' or who say that they do not trust anyone at all. While theories from psychiatry offer neat explanations, these do not get us very far sociologically. Indeed one can argue that many people possess greater or lesser tendencies to trust and that we need more sociological theory to help us understand the influence of enduring contexts and fateful moments on such dispositions. This brings us to the concept of habitus which is posed as one

central basis for considering dispositions towards trusting. The paper visits existing work in this area such as that of Misztal, Scambler and Britten, Möllering and others – synthesising this and moreover denoting the multiple ways in which the 'choice' to trust is highly constrained by institutional and interaction norms, socio-biographies, related vulnerabilities and further factors. A deeper knowledge of the ways in which tendencies towards trusting (or not trusting) are inculcated enables in turn a greater sensitivity

within analyses to the influence of power and its relation to agency within social interactions and relations.

## **a02RN22 - Risk, Vulnerability and the Pregnant Body**

Chair(s): Patrick Brown (University of Amsterdam)

### **"At Home I Knew They Wouldn't Judge Me": Trust and Risk Perceptions When Choosing a Home-Birth**

Mário J. D. S. Santos, ISCTE-IUL, Lisbon | [mariojdssantos@gmail.com](mailto:mariojdssantos@gmail.com)

Choosing a home-birth in Portugal is of sociological interest because of the complexity of relations established between knowledge, power and risk perceptions that are put into play. In fact, more than being "just" pregnant, a woman is socially responsible for the formation of the fetus, a new citizen, promoting risk perceptions that influence the pregnant choices, pushing them towards the bio-medical model. Other models oppose to bio-medicine and aim to conquer authority through its natural and holistic values, where home-birth can be included. Even so, people that choose a home-birth still have to deal with the social and medical risks associated to pregnancy and birth. But how are those risks configured and how much do they influence the options of a home-birth? To answer this, I present here some particular results of a wider qualitative study, conducted in 2012, on the experience of

home-births, in Portugal. Analyzing the results, it was possible to see that several motives beneath the option of a home-birth arose from the description of the hospital model of birth. The subjectivity of risk perceptions is very clear, with medical risks and social risks assuming multiple and sometimes opposite shapes, like in the hospital: medically assumed as the less risky place to give birth, while here is assumed as the most risky place. Moral risk, or the pressure and criticism that health professionals and others tend to make, also emerged as an important factor that has great influence over the options and the relationships established with the medical system of pregnancy surveillance. Nevertheless, childbirth is a social event and the options that surround it can't avoid social and medical expectations.

### **Implicit and Reflective Meanings of Female Body and Risks Occurring in the Obstetrical and Perinatal Field in Poland**

Magdalena Gajewska, University of Gdansk | [gajagajewska@wp.pl](mailto:gajagajewska@wp.pl)

Piotr Pawliszak, University of Gdansk | [p.pawliszak@gmail.com](mailto:p.pawliszak@gmail.com)

In the paper we analyze different organizational contexts in the field of perinatal care in Poland influencing perception and managements of risks connected with pregnancy and delivery. The risks generated by

obstetric medicine are currently being made public by new collective agents employing formerly marginalized common knowledge and practice along with its unconventional forms. Interaction between conventional and

unconventional epistemic communities gives rise to changes in the lifeworld, specialized medical subsystem of Polish society and individual cognitive practices. In the area of obstetric medicine we can encounter hybrid forms of practices, such as natural childbirth, alleviation of labour pains through immersion in water combining some elements of institutionalized, scientific knowledge with unconventional. Through analyzing narratives and meaningful actions aimed at either maintaining or altering the existing knowledge

paradigms and practices, we try to reveal and explained with cultural theory (Douglas, Thompson, Wildavsky) how they are moderated by structured socio-cultural environments in which they take place, as well as cultural contexts to which they refer. Moreover, we also concentrate on the conflicts and crises that arise between various entities as well as on both limitations and facilitations they encounter from the sociocultural structure of perinatal social field and from the social worlds functioning within its frames.

## Pregnant Women's Risk Perceptions of Maternal Drinking and Smoking

Raphaël P Hammer, University of Health Sciences | [raphael.hammer@hesav.ch](mailto:raphael.hammer@hesav.ch)

Sophie Inglin-Stoppini, University of Health Sciences | [sophie.inglinstoppini@hesav.ch](mailto:sophie.inglinstoppini@hesav.ch)

In Switzerland, as in other countries, official recommendations regarding alcohol and tobacco use during pregnancy involve a zero tolerance policy. However, prevalence studies indicate that the abstinence principle is not always followed by pregnant women. Drawing on qualitative data, this communication examines to what extent pregnant women perceive risks related to maternal smoking and drinking as similar or distinct risks. Data come from 50 semi-structured interviews with Swiss women, aged between 24 and 41 years. All participants had a normal pregnancy. Thematic analysis was performed on interview extracts that were related to knowledge, behaviours and attitudes regarding alcohol and tobacco consumption. Perception of risk has been addressed through three main themes: i) women's accounts towards official recommendations; ii) the contextualisation of

risk in daily life; and iii) the moral issues surrounding both risks. The main finding of this study is that maternal smoking and drinking are perceived as distinct risks, bearing contrasting meanings. Alcohol consumption during pregnancy was not necessarily considered to be a risky behaviour, since moderate drinking was seen as more acceptable and less risky than smoking. In particular, the moralisation of tobacco use was much more salient than alcohol use. Whereas maternal smoking was readily framed in terms of failing to control oneself or to act in the foetus' interest, "drinking once in a while" was seen in accordance with the imperatives of self-surveillance. More broadly, differences in social climate regarding alcohol and tobacco consumption might account to some extent for women's contrasting perceptions.

## **b02RN22 - Risk: Representations, Framing and Media**

Chair(s): Adam Burgess (University of Kent)

### **Mapping Terrorism Risk Perceptions in Europe**

Andreas Gofas, The University of Sheffield | [a.gofas@gmail.com](mailto:a.gofas@gmail.com)

Since the events of 9/11, terrorism has been the subject of intense political dialogue and public scrutiny. Through well publicized discussions about its constitution and consequences, terrorism has been framed in the prevailing public discourse as an all pervasive societal threat. In turn, the official response to this threat has created a pervasive atmosphere of anxiety where political fear bleeds into the fabric of daily life. At the same time, one of the liveliest areas of theoretical debate in social and political analysis is that addressing the phenomenon of risk and the role it plays in contemporary life. Surprisingly enough, there has been little empirical research, hitherto, of the ways in which the risk of terrorism, as the pre-eminent security preoccupation of western states, is perceived

by the public. Although there are some studies on the USA, this gap is all the more remarkable when it comes to Europe. This paper aims to address this imbalance in a theoretically and methodologically progressive way. Theoretically, it aspires to develop an integrative framework for the analysis of terrorist risk perception that brings together the key insights of disparate risk analysis research communities by introducing four context levels of analysis that co-shape terrorist risk perception. At the level of empirical innovations, the project is purposively designed to fill the above gap over the lack of a pan-European study on the determinants of the perceived risk of terrorism.

### **Media Representations of the 2011 England Riots**

Bill Durodie, Royal Roads University, Victoria | [bill.durodie@royalroads.ca](mailto:bill.durodie@royalroads.ca)

This paper will explore how the 'rioting' that broke out across various parts of England for one week in the summer of 2011 have been interpreted by different parties according to pre-assumed frameworks. One dominant strand presented - particularly by the international media - derived from the images of a burning warehouse in South London. The original version of the interim report of the Riots, Communities and Victims Panel, established by the British government to investigate and advise on the matter, also made use of images of fire, burnt-out cars and police in riot gear on almost every page. Notably, the version currently available on their web-site now omits all of these photographs. Equally, the final report issued by

the same group presents a view of happy communities getting together with brooms to clean-up after the events. Using footage derived from the viewing of the hundreds of hours of footage of these incidents made available on YouTube, this paper will show how both of these representations are - at best - partial constructs that meet the requirements of a self-serving narrative by the authorities concerned. The events themselves were more akin to looting than rioting, with little - if any - sign of political motivation or purposeful and collective organisation behind them. Fires did occur, but these were atypical. Equally, the police in general were most notable by their absence - a fact well-documented elsewhere in the media. Rather than a clash of opposing

forces challenging the authority of the state in relation to race, poverty or police brutality, this session will explore the possibility that we are

faced with the impasse between two equally impotent and incoherent outlooks in a post-political age.

## **When Science Trembles. Science, Politics, Media and Society in the Case of the Italian Scientists Conviction for the Earthquake in L'Aquila**

**Giuseppe Tipaldo**, University of Torino | [giuseppe.tipaldo@unito.it](mailto:giuseppe.tipaldo@unito.it)

**Astrid Pizzo**, University of Torino | [astrid.pizzo@gmail.com](mailto:astrid.pizzo@gmail.com)

**Selena Agnella**, University of Torino | [selena.agnella@unito.it](mailto:selena.agnella@unito.it)

On 22 October 2012 the court of L'Aquila (Italy) sentenced to six years in prison six Italian scientists, members of the "Commissione Grandi Rischi" (a governmental committee on major hazards prevention), founding them guilty of multiple manslaughter for having falsely reassured citizens five days before the devastating earthquake of 2009, which claimed more than 300 lives. The reactions to the sentence are essentially of two types: the media framed the issue as an attack on science liberty, while others, such as the prestigious journal *Nature* (2012, 490: 446), found the verdict "perverse" and the sentence "ludicrous", worried about the serious implications "about the chilling effect on (scientists') ability to serve in public risk assessments". This paper, part of a wider longitudinal study on science communication practices by Italian researchers initiated in

2012 by the University of Turin (ISAAC - Italian Scientists multi-technique Auditing and Analysis on science Communication), will take the story of L'Aquila as a "revelatory" case study (Yin 2003), uncovering the complex communicative interactions that today increasingly bind Science, Politics, Media and Society in risk assessment and uncertainty management. Moving from an approach that shows quite a few points in common with the Sociology of Knowledge, and in particular with the concepts of situated actions, motives and questions proposed by Wright Mills in an essay become a classic (Wright Mills 1940), the paper proposes and discusses a theoretical model of interaction between the components mentioned above, the validity of which is tested drawing on a wide basis of documents, including data from a CAWI survey on the Italian scientific community.

## **Health Risks and their Coverage in the Printed Media and the Specialized Journals in Modern Russia**

**Efim S. Fidrya**, Immanuel Kant Baltic Federal University | [efim.fidrya@gmail.com](mailto:efim.fidrya@gmail.com)

This paper provides an analysis of relations between probabilities of morbidity and mortality in Russia and their coverage in Russian printed media and scholarly medical journals during 2004-2010. The statistical data on the overall number of morbidity and mortality cases classified in accordance with ICD-10 were given and statistical health probabilities were calculated. Then the figures

of diseases coverage in the printed mass media and the specialized medical media for the same blocks of diseases over the period between 2004 and 2010 were acquired. Finally, the statistical methods were implemented in order to examine the relations between mortality and morbidity probabilities and their media coverage. The results show a strong correlation between the death probabilities and

the coverage of the diseases in the specialized media; however no significant connection with factual statistics was discovered for the mass media. Resume: 1) mass media are mostly interested not only in rare fatal events, but in risks which has 'social' component (i.e. related to social interaction; keeping on social norms; deviations etc.); 2) specialized media most sensitively react on the dynamics of the fatal

health risks catching changes in the death counts by different causes; 3) mass media and specialized media construct health risks in their own ways probably depending on their place in the structure of social relations and logics which set the specific ways of evaluating health risks and direct their attention to the most 'risky' events which are totally differ in different kinds of media.

## **a03RN22 - Risk, Professional Decisions and Communication**

Chair(s): Patrick Brown (University of Amsterdam)

### **Mentally Disordered Offenders' Perspectives of the Purpose of Risk Management Procedures in the Community**

Jeremy Dixon, The University of Bath | [j.dixon2@bath.ac.uk](mailto:j.dixon2@bath.ac.uk)

Mentally disordered offenders subject to section 37/41 of the Mental Health Act 1983 (England and Wales) are subject to conditions and restrictions operated by the Secretary of State. The legal basis for such an order is that it is 'necessary for the protection of the public from serious harm' and mental health services are tasked with identifying, monitoring and minimising such risks to the public. Relatively little has been written about the way in which this group of offenders understands and makes sense of the supervision process. This paper draws on original research with mentally disordered offenders subject to section 37/41 and uses theories of social control to examine

their perceptions of risk management. The order was seen by some as a means of identifying them as mentally disordered in order that medical support could be provided. Other users believed that the order worked to help them internalise acceptable standards of behaviour. A final group saw the order as a means of labelling their behaviour in a manner which stigmatised them. A number of service users showed awareness that the order acted to limit the actions of professionals and in these cases service users were able to utilise the order as means to minimising the risks of receiving poor aftercare services.

## A Situational Perspective on Risk Communication – Personnel Employed by the Swedish Migration Board Communicating Risk

Jonny Bergman, Mid Sweden University | [jonny.bergman@miun.se](mailto:jonny.bergman@miun.se)

Erika Wall, Mid Sweden University | [erika.wall@miun.se](mailto:erika.wall@miun.se)

In this paper we engage with the question of how personnel employed by the Swedish Migration Board make sense of their work for the well-being and welfare for asylum seekers and how this understanding relates to how risk is communicated. From a perspective of relational communication of risk it is important to acknowledge asylum seekers as well as personnel employed by the Migration Board as active participants in the understanding and communication of risk. The study presented in this paper relates to research focusing on how asylum seekers in Sweden manage their situation and a project looking at the communication of fire safety between the

Swedish Migration Board and asylum seekers. The point of departure on research discussed in this paper is that although the situation for asylum seekers is the most pressing, the situation for the personnel employed by the Migration Board working with issues of well-being and welfare for asylum seekers, are also socially, politically and emotionally circumscribed. In that way understanding how work for the well-being and welfare for asylum seekers, in this case on risk communication and fire safety, depends on also recognizing how personnel employed by the Migration Board grapple with their work situation.

## “Just Do It”: How Do Experts Move beyond Rules and Guidance When Making ‘Risky’ Decisions?

Gemma Mitchell, University of Leicester | [gm95@le.ac.uk](mailto:gm95@le.ac.uk)

‘Just do it’ is a quote from a review of child protection in England by Lord Laming in 2009. This review followed the death of Peter Connelly in August 2007 who was known to children’s services in Haringey. In the most recent review of child protection services in England, Professor Eileen Munro (2010; 2011a; 2011b) points out that experts do not intend to make mistakes, and argues that a systems approach should be taken in order to provide an environment which supports professionals to make decisions that are as likely as possible to protect children. Indeed, Munro goes further, and defines experts as those who are able to go beyond official rules and guidance when making decisions involving risk and

uncertainty. These official documents are in the process of being dramatically cut as per the report’s recommendations. However, this development has been contested and some local authorities have expressed concern regarding the apparent increased flexibility of child protection guidance. This paper analyses three examples of current child protection policy documents and also draws on interviews with this group of experts to discuss how they ‘just do it’ rather than relying on official rules and guidance. It also questions why the increased acknowledgement of uncertainty from policy makers in practice has not been met with widespread approval from those working with children and families.

## **b03RN22 - Responding to Disasters and Crises amidst Uncertainty**

Chair(s): Jörgen Sparf (Mid-Sweden University)

### **School's Out Forever? Analysing Mass Violence Threats Investigated by the Police**

**Atte Oksanen**, Finnish Youth Research Network | [atte.oksanen@utu.fi](mailto:atte.oksanen@utu.fi)

**Emma Holkeri**, University of Turku | [emma.holkeri@utu.fi](mailto:emma.holkeri@utu.fi)

**Pekka Rasanen**, University of Turku | [pekka.rasanen@utu.fi](mailto:pekka.rasanen@utu.fi)

The notorious school shooting tragedies in Finland (2007 and 2008) had direct impact on school anti-violence policy. Since pupils tried to attract public attention by making threats of new school massacres, a zero tolerance policy was implemented. The Finnish National Board of Education recommended schools to report every threat directly to the police. In the spring of 2011, the Finnish police stated that there have been over 500 threats reported to Finnish police. In this paper, we examine school massacre threats as a societal risk factor. Our data is drawn from the school massacre threats investigated by the Finnish police during 2010 (n=40). Within one year over 100 cases were reported to police, but only 40 of these led to criminal investigation. The perpetrators were approximately 16-year-olds.

Although the threats were mostly made by students, some were anonymous and some were made by adult males. Only three cases involving a female suspect were investigated. In addition, the ICTs were used in a half of the cases. School shooting threats are a complex phenomenon, which involve different levels of seriousness. Most of the threats are merely connected with impulsive and delinquent behaviour. Few cases could be considered properly calculated and serious. We argue that school massacre threats represent an example of an unintended consequence in risk governance. We also discuss how the threats reflect with the general understanding of risk in the present society, particularly in Finland, which is often seen as one of the most secure countries in the world.

### **Mice, Oysters and Public Health: A Precautionary European Standard in the Event of Uncertainty**

**Aurélie Roussary**, IRSTEA | [roussary@univ-tlse2.fr](mailto:roussary@univ-tlse2.fr)

**Denis Salles**, UR ADBX | [denis.salles@irstea.fr](mailto:denis.salles@irstea.fr)

This communication questions the production and the renegotiation of the social, technical and organizational devices of risk and uncertainties management between the local, national and European levels. It leans on a retrospective analysis of the trajectory and trials of a European standard of public health. The mouse bioassay was the European standard to evaluate the sanitary quality of shells. But in 2005, waters of the Bay of Arcachon in the southwest of France are

contaminated by a mysterious toxic agent. Bioassays are positive; nevertheless no known toxin is detected in waters. According to the legal framework and in the name of the precautionary principle, shellfish growing areas are the object of an administrative ban on the marketing of shells. Until 2009, these closures caused locally deep challenges of oyster professionals widely relieved by elected representatives and local populations. These events knew an important national and

European media echo, which changed into real institutional crisis. The public controversy ended in 2010, with the substitution of the mouse bioassay method by a chemical analysis as European reference for any statutory decision. We show that the political decision to substitute a precautionary standard by a socio-technical device of management-vigilance was

built by various dynamics. They related to unpredictable events (sanitary crises, unknown toxic agents), to the evolution of scientific knowledge, to collective mobilizations (corporatist, public controversies) and to the statutory, commercial, ethical multi-levels orders.

## How Is Risk Translated into Action? The Notions of Crisis in Risk Management.

Piotr Matczak, Adam Mickiewicz University, Poznań | [matczak@amu.edu.pl](mailto:matczak@amu.edu.pl)

Vera-Karin Brazova, Charles University, Prague | [v.k.brazova@gmail.com](mailto:v.k.brazova@gmail.com)

With the growing role of the state in risk management over the last 100 years, the public administration possesses currently the dominant role. The state's coordination and the use of resources are regulated by legislation and administrative conduct. In this respect the notion of crisis plays a decisive role as it triggers a set of actions. Not only is the definition of a crisis based on the risks perceived – and thereby can change when new risks occur, but also different crisis situations facilitate certain attributions of organizational responsibility for a crisis (Coombs 1995). There is no uniform definition of a crisis. Moreover, in different countries the notion of a crisis tends to be defined and understood differently. In the paper, the Czech, Slovak and Polish cases are

presented in the wider European perspective. In Poland, a serious discussion concerning the definition of crisis in the law on crisis management occurred as the Constitutional Court questioned the definition of "crisis" in the Crisis Management Act. The definition was based on the concept of "breaking or significant impairment of social ties", which was considered by the Court as imprecise and ambiguous. In the Czech Republic and Slovakia, on the other hand, despite the common history, the organizational evolution led to different definitions of crisis and thus to different operational procedures in dealing with them. The implications of the definition of crisis for the crisis management operations are discussed in the paper.

## Situational Awareness in Crisis Management - Creating Meaning in Unsafe Situation

Robin Karlsson, Mid Sweden University | [roka0904@student.miun.se](mailto:roka0904@student.miun.se)

Olof Oscarsson, Mid Sweden University | [olos0900@student.miun.se](mailto:olos0900@student.miun.se)

This study focus on how crisis organizations create and use situational awareness during major accidents and crisis. Its purpose is to contribute with knowledge about how individuals understand the term situational awareness, what need it satisfies and how they establish situational awareness from an individual sensemaking perspective, derived from Karl E. Weick's theory. Our object of study

is staffs- and management personnel from police and fire department within Östersund. We have made a qualitative study based on interviews with individuals possessing personal experiences of our study area and also observations during a practice for collaboration within and between organizations. It is concluded that situational awareness is an ongoing process when

relevant information is collected for what has happened, happens and will happen. Furthermore, there is a need for situational awareness to make decisions and prioritize resources. The sensemaking process taking place in the creation of situational awareness is associated with seven elements for sensemaking. All elements should be viewed

from a holistic approach, since all elements influence each other. However, this study conclude that during the sensemaking process for creation of situational awareness there's two elements that have more significance. Those elements are retrospective and selected signals and are based on experience and information.

## **a04RN22 - Perceiving Risk 1: Influence of Structures and Biographies**

Chair(s): Aiste Balzekiene (University of Technology)

### **Socio-Structural Determinants of Self-Perceived Job and Income Risks**

**Andrea Hense**, Bielefeld University | [Andrea.Hense@uni-bielefeld.de](mailto:Andrea.Hense@uni-bielefeld.de)

Economic crises generate distributional conflicts that change the way how economic resources and risks are distributed through employment relationships in modern welfare states. Theoretical debates about precarity, flexible labor markets, and deregulation of welfare states demonstrate the relevance of this issue. Moreover, empirical findings show, that employees are increasingly concerned about job and income insecurities, and that this affects their well-being and social relationships. Nevertheless, a theory-guided analytical framework is missing that explains why certain groups of employees are more likely to perceive higher risks than others. While psychological theories help to understand the cognitive part of this mechanism, the sociological part of this explanation and the development of a theory-guided analysis of social-structural impacts

are largely neglected. Thus, I will present an analytical framework that combines Lindenberg's social production function theory with Bourdieu's field theory. On the one hand, self-perceived risks are explained with actual restrictions in resources (capital) that are able to produce or substitute future income. On the other hand, self-perceived risks are explained with former experiences that influence patterns of perception. The derived hypotheses are tested empirically using panel data from 1984-2011. It can be shown that decreasing credentials, job status, and household income as well as fixed-term contracts increase self-perceived job and income risks. Moreover, people who experienced unemployment in the household and working-class children perceive higher risks, while cohorts who entered into a flexible labor market partly adapt to these conditions and perceive less risks.

## Understandings of Risk: An Intersectional Analysis

Anna Olofsson, Mid Sweden University | [anna.olofsson@miun.se](mailto:anna.olofsson@miun.se)

Susanna Öhman, Mid Sweden University | [susanna.ohman@miun.se](mailto:susanna.ohman@miun.se)

Applying an intersectional perspective, this paper focuses on the understanding of risk and the significance of diversity. Intersectional theories are particularly interesting since it both captures stratification and power relations in society and the complexity of multiple belongings, that is, the meaning of being not only e.g. a woman but also poor, middle aged and belonging to a minority population. The aim is to gain deeper understanding of people's way of defining and handling the concept of risk in relation to their unique position in society based on gender, place of origin, sexual orientation, lifespan position and place of residence. The study make use of the transcripts from 17 focus group interviews with men and women, people

with foreign background and homo- and bisexuals at different ages living in different places in Sweden. The findings show how the intersections between individuals' lived experience as well as socio-cultural and physical surroundings are linked to the way they understand and act in relation to risk. Experiences of discrimination and stigmatization among for example homosexual men and women as well as men and women with foreign background influence the way risk is handled in everyday life, as well as individual experiences of for example parenthood, war and illnesses. For some, particular kinds of risk have shaped their life. Risk in this way is not only something to be understood and dealt with, it is a part of the individual biography.

## Risk, Uncertainty and Action

Alex Tham, Princeton University | [ktham@princeton.edu](mailto:ktham@princeton.edu)

In a pragmatist model of action, as outlined by theorists such as Hans Joas, actors project lines of action into the future based on the situation-at-hand that they experience in the present. Projected lines of action can be understood to include expectations and an intuitive sense of risk involved. Where risk is excessively high, expectations would tend to be

low and alternative lines of action might be considered instead. But what about situations where the actor is uncertain about which action to take? My paper examines the social construction of expectation and risk, and the implications for action under uncertainty using the AddHealth dataset.

## **b04RN22 - Risk, Data and Governance**

Chair(s): Christian Bröer (University of Amsterdam)

### **Incalculable but not Unimaginable: Researching the Aesthetics of Everyday Risk in UK Fire and Rescue Service Exercise Planning**

Nathaniel O'Grady, Durham University | [nathaniel.o'grady@durham.ac.uk](mailto:nathaniel.o'grady@durham.ac.uk)

Since the 2004 Fire and Rescue Services Act and continuing in the contemporary, attending to the everyday risk of fire has been significantly renegotiated among multiple strategic lines. Overall, the UK Fire and Rescue Service has moved from simply governing fire risk to governing through fire risk. A host of analytic technologies have been embedded in the service to calculate, envision and project risky futures, informing and legitimating decision making on how to govern this future. It is accepted in the service, however, that the nature of risk is one which cannot be entirely captured by conventional forms of risk analysis. In other words, there is a limit to analysis, beyond which fire risk is recognised as uncertain and incalculable. It is this limit

point of conventional risk analysis with which this paper concerns itself. By critically examining the construction and deployment of exercise scenarios to imagine potentially dangerous future incidents, the way in which non-conventional, aesthetic, forms of knowledge are utilised to understand and speculate upon uncertain risks of the future is discussed. From the recognition of fire incidents which possess a quality never before experienced and their simulated staging, to how they come to inform decision making on how fire risks might be managed, this paper seeks to show how exercises are emblematic of new forms of techniques used to identify risks and become crucial to governing the future through action in the present.

### **A Risk-Generator State? The Construction of the Risk Related to Base Station Transmitters for Mobile Phones in Italy**

Paolo Crivellari, University of Toulouse3-Paul Sabatier | [paolo.crivellari@iut-tlse3.fr](mailto:paolo.crivellari@iut-tlse3.fr)

In many countries worldwide base station transmitters for mobile phones (BST) have been associated to a health risk by the citizens, despite the lack of scientific evidence about carcinogenetic effects on human health due to electromagnetic non ionizing emissions. Environmental, economic and aesthetic issues related to BST have been progressively overshadowed in favour of a health frame. Now, the link between public health and BST cannot be taken for granted. As a matter of fact, no sanitary crisis or victims can be causally attributed to electromagnetic radiations. Therefore, a naturalistic approach explaining this link as the result of intrinsic

properties of BST is not satisfying. Instead, constructivist approaches have been successfully applied to the risk related to BST in a comparative perspective (Adam Burgess) and in the case of France (Olivier Borraz), showing that the way in which governmental health regulation is framed plays a key-role in risk construction. The proposed paper is based on an empirical sociological case-study that has been conducted on the local and national level in Italy, using qualitative research techniques (semi-structured interviews and participant observation). It aims at explaining when, why and how the link between BST and human health has become self-evident in this

country. Conclusions will focus on the effects of a regulation characterised by a health risk framing (Prodi government 1998) on citizens perception and will focus also on the politico-

institutional structures in which risk regulation is conceived and on the role played by the State in risk construction.

## **Coping with Uncertainty: High-Tech Fetishism and the Politics of European Civil Security Research**

**Georgios Kolliarakis**, University of Frankfurt | [kolliarakis@soz.uni-frankfurt.de](mailto:kolliarakis@soz.uni-frankfurt.de)

The rise of 'Critical Infrastructure Protection' and 'Civil Security' agendas in the past decade brought a shift of practice in the field of European security policy. Still, while most studies critically address state security policies, the role of security research in defining and prioritizing threats, influencing policy objectives, and developing the means to achieve them has been largely understudied. The argument of this paper is that current European security research is trapped by high-tech fantasies of risk and uncertainty control. The promotion of technological solutions favors a narrow understanding of risks and legitimizes detection measures as the appropriate instruments to address them. The paper elucidates the politics of the European security research policy in order to explore the impact it has on the ontological aspect of insecurity and the epistemological one of

uncertainty. First, the way stakeholders are engaged in security research reveals a strong supply-driven bias, not least due to the fact that EU Security Research is not managed by the EU DG Research & Innovation, but by DG Enterprise & Industry which favours market-compatible technological solutions. Second, the frames used to deliver diagnoses and therapies focus on low-probability/high-impact catastrophes and promote high-tech gadgets as a response to comprehensive societal problems. Yet, regression to modernist illusions of surveillance comes together with a gap in transparency and accountability. In that fashion, threats become objectified and the choice of solutions depoliticized. This paper empirically examines EU documents and draws on the author's participant observations from expert consultations on security research at EU level.

## **Risk Conception and Risk Management in the Age of Financialisation**

**Turf Böcker Jakobsen**, SFI - The Danish National Centre for Social Research | [tbj@sfi.dk](mailto:tbj@sfi.dk)

**Christian Poppe**, The National Institute for Consumer Research (SIFO), Oslo | [poppe.christian@gmail.com](mailto:poppe.christian@gmail.com)

**Sharon Collard**, University of Bristol | [s.collard@bristol.ac.uk](mailto:s.collard@bristol.ac.uk)

The deregulation of the Western economies from the late 1970s onwards has fundamentally changed the economic environments in which households operate. One obvious consequence is that home loans and consumer credit have become more easily available to almost everybody. From now on, all households – even the poor – are largely expected to take on responsibility for their own

welfare using borrowed money. But just as important, this inevitably implies a financialisation of every-day life, i.e. an increasing dependence on the finance industry and financial products. As more and more loans are taken out to invest and consume, financial risks become a major issue for households. Based on 18 focus groups in Norway, Denmark and the UK (six in each

country), covering lower, middle and higher income bands in two age cohorts (30-40 and 50-60 years), this paper analyses how financial risks are understood and managed across different country settings. Contrasting behavioral economic approaches with social theories of risk including those of Ulrich Beck, Anthony Giddens and Mary Douglas, we demonstrate how looming threats to

household welfare are defined in financial as well as social terms without leading to adequate understandings of the need to mitigate risks. We argue that this is better explained at the social rather than the individual level, and that it has important implications for the social responsibility of modern welfare states.

## **a05RN22 - Perceiving Risk 2: Exploring Social Dynamics**

Chair(s): Anna Olofsson (Mid-Sweden University)

### **A 'Ritual' against Health Risks?: Surgical Mask Wearing in Japan**

Mitsutoshi Horii, Shumei University | [m.horii@chaucercollege.co.uk](mailto:m.horii@chaucercollege.co.uk)

Surgical mask wearing in Japan is a ritualistic form of action. It has been carried out by a significant proportion of the national population; and it has been embedded in people's everyday lives. The notion of 'ritual' is employed in this paper in order to highlight the symbolic aspect of the practice. It is, however, not so much in the sense of the Durkheimian collective social ritual, nor Goffman's interaction ritual, but more with a proximity to the carrying of amulets. In the 1920s, introduced from the West, carrying the symbolism of modern science, the practice of mask wearing replaced pre-modern 'superstitious' rituals against flu in Japan. It started with being worn by healthy individuals to avoid infection, followed by the infected as

social etiquette, not to infect others. In addition to this usage which continues up to the present, by the 1990s, masks had been used widely by cedar pollinosis sufferers to avoid inhaling pollen. Since March 2011, radioactive particles from Fukushima have been added to the list of health risks to be avoided by wearing masks. What wearing a mask provides is peace of mind amidst uncertainties. Its instrumental values to reduce health risks are scientifically inconclusive. What is certain is that the practice precedes scientific discussions. The practice of mask wearing absorbs anxieties and uncertainties over health risks and restores the sense of self-control over the body.

## Time, Temporality and Technology: Rethink the Implications of a Different Relationship between Natural and Social Rhythms

Emília R. Araújo, University of Minho | [era@ics.uminho.pt](mailto:era@ics.uminho.pt)

Due to the high speed of variations, expressed in an ever increasing emergence of alternatives, ways and possibilities to manipulate natural times and rhythms, it becomes more difficult to map the radicalness of changes taking place, as well as of their actual effects on people's perceptions and experiences of the world. It becomes, we say, more difficult to take conscience of the progressive distance between the worlds of tecnotime-spaces and mediastimespaces and the world of institutions, rules, programs, values where, anyway, social life develops. Additionally it is even more difficult to discern how values, norms and principles do meet into that problematic articulation between materiality and visibility and immateriality,

ubiquity and opportunity as well as how are societies and their institutions prepared to deal with the young generations whose contacts with the old time and temporality is almost and increasingly none. The communication is divided in three main points. First we explain the theoretical framework concerning the contribution of time and temporality to deepen our knowledge on risk and uncertainty. Secondly we show the main focus of change between "old" and "new" regimes of temporality. Thirdly we show what are the main implications and the main tensions of that change for the present, using empirical data from a research made in Portugal about uses and representations of time and technology.

## 'Should I Be Worried?' - Citizens Perceptions of Mobile Phone Technology Health Risks over Time.

Bert de Graaff, University of Amsterdam | [m.b.degraaff@uva.nl](mailto:m.b.degraaff@uva.nl)

Christian Bröer, University of Amsterdam | [c.broer@uva.nl](mailto:c.broer@uva.nl)

In this paper we examine how citizen's perceptions of a specific health risk change over time in relation to changes in risk governance. This is part of a larger project on the effects of risk communication on citizens' perceptions of the risks of electromagnetic fields (EMF) associated with mobile phone technology. Earlier, we have investigated the interactions between key-actors of science, policy, industry and social movements on this issue in the Netherlands and found that scientific uncertainty is predominantly depoliticized in Dutch governance of the EMF and health issue. Citizens' civic practices are rarely opened-up or explored. Here we compare these findings to two waves of longitudinal interview and survey data on two

panels of citizens in the Netherlands. These citizens are confronted with the siting of a base-station for mobile phone technology in their neighborhood. In particular, we test the finding that issue-specific governance practices discipline citizens' problem definitions (Bröer, 2008; Bröer & Duyvendak, 2012; Bröer et al, 2013). To do so, we work with an interpretive, relational sociological perspective on the 'techno-social' practices of base-station siting. We focus diachronically on the relation between, on the one hand, conceptualizations of risks and uncertainties in risk governance and specific siting practices, and, on the other hand, the conceptualizations of risk and uncertainties regarding mobile phone technology citizens express. Finally, we

discuss methodological considerations when combining interpretive and survey-design in

longitudinal research into risk perception.

## 21 December Doomsday Rumours: Late Modern Anxieties or Hangovers from Our Superstitious Past?

Kayhan Delibas, Adnan Menderes University, Aydın | [kdelibas@adu.edu.tr](mailto:kdelibas@adu.edu.tr)

There have been widespread rumours that there will be a catastrophe or even a doomsday related to the Mayan calendar, 21 December all over the world. For months beforehand many believed that the end of a 5,125-year-long cycle in the ancient Maya calendar was going to be the end of world. Sense of an impending Armageddon and panic even led governments to take action in many countries like the US, China and France. Scientific bodies such as NASA officials took the time to dispel these rumours and even the Vatican appealed to the public not to take the rumours seriously. These fears and rumours were widespread in Turkey, gaining widespread coverage in mainstream and social media. According to rumour, one of the two places in the world destined to survive the devastation was the

Turkish village of Şirince in the district of İzmir. This research is focused on the case of Şirince. The paper will draw on quantitative questionnaire (N 350) and in depth interviews. One of the key questions is how to conceptualise these doomsday rumours? In particular this paper considers whether rumours are most usefully characterised as reflexive modern/late modern anxieties or as hangovers from our superstitious past? Or indeed are they suggestive of a 'New Dark Ages'? (Franklin, 1998). The paper suggests that Turkey has been rapidly becoming part of the world risk society, but in quite distinctive ways comparable to how Beck (2010) has characterised the path taken by China to late modern risk and individualization.

## b05RN22 - Dynamics of Risk Governance - Polycentric Regimes

Chair(s): Adam Burgess (University of Kent)

### The Construction of Collective Attention to Environmental Health Risks through Social Conflicts

Aymeric Luneau, Ecole des Hautes Etudes en Sciences Sociales, Paris | [Aymeric.luneau@gmail.com](mailto:Aymeric.luneau@gmail.com)

The main question which my paper deals with concerns the conditions in which environmental risks may become a shared problem. I am interested in the transformation of individual experiences into a collective attention to a particular situation. This issue, which Emerson and Messinger address in their article "The Micro-Politics of Trouble" (1977),

is not new. When actors try to alert their family members, their friends, their neighbours, their co-workers or the public authorities about environmental risk, they should be involved in arguments to prove that this risk on the health and the environment is real. However, the conditions for the existence of social conflict involve actors engaging in exchanges about a

particular subject (E. McMullin, 1987; D. Raynaud, 2003). For example, when an environmental risk triggers a scientific controversy or a political conflict, it becomes the core of discussion and it draws the attention of actors. Therefore, I would like to demonstrate that the collective attention about risks depends on the dynamics of conflict. I will illustrate my proposal with the comparison between three environmental health problems that I'm analysing for my PhD work: the controversy over the reality of the "Multiple

Chemical Syndrome", the use of perchloroethylene in laundries and the health impact of the pollution around the "Etang de berre", an industrial area near Marseilles. I aim to suggest that the lack of conflict over the "MCS syndrome" in the French situation could be a reason for the low public attention about this illness. I will conclude my paper with the link between the phenomena of crises, such as economic or environmental crises, and the inability of stakeholders to build a space for debates.

## **The Formation of Lithuanian Energy Security Discourse: The Role of Politicians, Scientists and Media**

**Dainius Genys**, Vytautas Magnus University, Kaunas | [d.genys@gmail.com](mailto:d.genys@gmail.com)

The aim of the paper is – to explain the role of politicians, scientists and media in Lithuanian energy security discourse formation. The empirical study was based on both qualitative and quantitative approaches. The paper deconstructs the process of energetic discourse formation, analyzes such features of the role of the actors of energy security discourse as initiativity and strategy; discusses the discourse circulation context; investigates the differences of speech on energy security between politicians, scientists and media. By using theories of risk society and discourse analysis, paper reveals the processes of risk and hazard formation within energetic sector in Lithuania. Lithuanian energy security discourse formation is based on competition between with energy business related interest groups and political parties. The initiative of discourse formation belongs to the

government, but the real process is not transparent enough and is actually more bureaucratic rather than democratic. Both scientists and politicians are not only aware of the major energetic problems plaguing the country or of their consequences, but also of various strategies for their solutions. However, neither strategies nor solutions are consistently and effectively implemented in practice, due to the failure in finding a constructive relationship between the competing discourses and due to the disagreement on common goals between main actors. The research shows that Lithuania is lacking an institutional mechanism through which competence of scientists would be incorporated in decision making process. Media discourse is lacking strong actors and leaders who could form diverse and comprehensive discourse of energy security.

## **Collective Bargaining: An Alternative to Social Risk Protection?**

**Mara A Yerkes**, The University of Queensland | [m.yerkes@uq.edu.au](mailto:m.yerkes@uq.edu.au)

**Joan Corrie**, The University of Queensland | [J.corrie@uq.edu.au](mailto:J.corrie@uq.edu.au)

**Judith Raven**, Erasmus University, Rotterdam | [raven@fsw.eur.nl](mailto:raven@fsw.eur.nl)

Welfare states have been under great pressure to reform existing social policies while

simultaneously developing new social policies to facilitate social risk protection for issues

related to training across the life course and work-care combinations. These pressures have intensified in many countries as a result of the global financial crisis (GFC). One possible means of alleviating these pressures is to rely on social partner involvement in social risk protection, for example through collective bargaining. Recent European scholarship has devoted attention to the issue of social risk compensation through collective bargaining (e.g. Ebbinghaus, 2011; Johnston et al., 2011; Yerkes, 2011). This literature demonstrates a significant capacity for collective bargaining to provide social risk protection. However, much of this literature focuses on European countries with relatively strong unions or significant bargaining coverage. The question remains whether

collective agreements can offer similar protection in countries where the position of unions has significantly declined in recent decades or where bargaining coverage is lower. In this paper we look at the role of unions in social risk protection in Australia. How does the Australian case compare to European developments? Australia, with its minimal welfare state policies but significant industrial relations history, provides an opportunity to investigate empirically the role of unions and collective bargaining in social risk protection in a challenging institutional context. In this paper, we examine the role of trade unions and collective bargaining coverage in the reform of unemployment policy compared to the development of parental leave policy for 1997-2012.

## The Constitution and Reconstitution of Risk in Crisis Preparedness and Response Training

Mikael Linnell, Mid Sweden University | [mikael.linnell@miun.se](mailto:mikael.linnell@miun.se)

In recent years, education and exercise in societal crisis preparedness and response activities have increasingly proliferated. Thus, we tend to spend an increasing amount of time and resources being prepared for impending but uncertain negative events. Local community representatives, public institutions and organisations within critical infrastructure are expected to hold regular exercises in order to prepare for future potential crises. Likewise, civil sector organisations are utilized to assemble engaged citizens. Voluntary organisations dealing with societal crisis preparedness and response seek new ways to capture and educate the public. At the same time, the contemporary regime in managing societal crises is as cross-sectional and inter-organisational collaboration. The purpose of this paper is to explore how the risk of

uncertain future events is being constituted and reconstituted in the context of two voluntary organisations dealing with societal crisis preparedness and response. What kinds of risk-categories are members being taught to prepare for, what do these categories actually comprise, and how do members prepare for them? These issues will be explored in an object-oriented approach which draws on Harold Garfinkel's notion of oriented objects (2003), Stephen Hilgartner's notion of risk objects (1992), and Susan Leigh Star & James Griesemer's notion of boundary objects (1989). These different notions of objects share the basic assumption that social objects, like risks, must be mutually oriented, which means that they must be rendered in a mutually intelligible form in order to exist as social objects (Rawls 2008).

## a06RN22 - Sense-Making of Risks: Groups and Social Dynamics

Chair(s): Anna Olofsson (Mid-Sweden University)

### The Role of Risk in Repeated Information Cascades.

Katarzyna Abramczuk, University of Warsaw | [k.abramczuk@gmail.com](mailto:k.abramczuk@gmail.com)

Shenghua Luan, Max Planck Institute for Human Development, Berlin | [luanshenghua@googlemail.com](mailto:luanshenghua@googlemail.com)

Rocio Garcia-Retamero, University of Granada | [rretamer@ugr.es](mailto:rretamer@ugr.es)

We investigate experimentally the role of risk in sequential choices. In information cascades agents imitate predecessors' decisions ignoring private information to maximize individual payoffs. This harms information aggregation and payoff at the group level. When cascading game is repeated this negative consequence can be overcome by maintaining a reciprocal cycle, in which agents take turns to reveal their private information in early positions of a decision sequence. It requires cooperation in Public Good Games style. We analyse determinants of this cooperation experimentally and show that participants are more likely to reveal their private information in the beginning of the decision sequence when the sequence is reshuffled in each iteration i.e.

reciprocity is possible. Next we show that this effect is heightened by a risky payoff scheme. Most phenomena being described in terms of cascading such as investing behaviours are characterized by such scheme. It increases both the risk to the individual and group benefit from revealing choices. We show that the players reveal more in this case. We also show that when both factors are at work i.e. sequence is random and payoff scheme is risky the actual group payoff exceeds payoff to perfectly Bayesian group. Furthermore we provide some insight into group processes standing behind the phenomena described above and show when people perceive other group members as both more trustworthy and more trustful.

### The Risk Analysis of Artists' Activity in Creative Communities of Saint-Petersburg

Alexander M. Pivovarov, Saint-Petersburg State University, Faculty of Sociology | [a.pivovarov@spbu.ru](mailto:a.pivovarov@spbu.ru)

Results of qualitative research on creative communities uniting artists of Saint-Petersburg are reported in this paper. Various risks the artists face in their creative activity under conditions of financial and structure uncertainty are found and described based on analysis of in-depth interviews. On the one hand, members of a creative community can reduce such risks as the risk of being unclaimed or the risk of losing professional reputation. On the other hand, they encounter other risks, such as the risk of restriction of their artistic freedom or the risk of plagiarism.

The artists' creative activity is considered in the framework of the Lyng's edgework model. According to it, the popularity of various versions of voluntary risk-taking behavior is the compensation for alienating and benumbing conditions of highly structured work environment, which are typical for most jobs available in the modern workplace. Apparently, the line that separates the presence and the absence of subjective "connection" with the reality represents the "edge" that an artist risks to cross. The edge of losing connection with reality is extremely

relevant to artistic creativity since each artist strives to demonstrate his unique originality. The problem is that an artist can leave the recognized professional field and come to the point of being stigmatized as an outcast during his creative experiments and search for his own style. In contrast to the S. Lyng's

approach, a collective level is incorporated in my analysis of the artists' search for the edge. One of tasks of this study is to find if being a member of an art group promotes a shift to making more risky decisions than ones typically made by unaffiliated artists.

## Articulations of Risk in a Lower Criminal Court

Irene van Oorschot, Erasmus University, Rotterdam | [vanoorschot@fsw.eur.nl](mailto:vanoorschot@fsw.eur.nl)

Social scientific analyses of the meanings and uses of risk have often focused on its articulation in official policy and policy statements. In the study of criminal justice, risk has similarly received attention as a notion that informs the adoption and proliferation of a host of "risk-management" techniques and policies, such as mandatory drug-testing for convicts on parole, the extension of parole supervision, and the development of risk or risk/needs assessment technologies. However, relatively little is known about the articulation and deployment of this notion in every-day judicial sentencing practice. This is a curious lacuna, especially as sociological literature on policy-implementation and institutional change suggests that formal policy-goals are frequently reworked and renegotiated in every-day professional and bureaucratic work

practice. Based on ethnographic fieldwork among court employees, specifically lower court judges, this paper aims to present the various ways risk is articulated and actively employed in every-day sentencing practice. What is the notion of risk judges in the lower criminal courts work with? How does their discourse of risk aid in "making sense" of defendants? How and when is it deployed in providing a motivation or justification for their verdicts? And how and when do the two meanings of risk, i.e. being "at-risk" or "risky", feature in judges decision-making practices? In answering these questions, this paper aims to contribute to the sociological literature on the way risk and risk discourses are reworked and "vernacularized" in every-day work practice.

## b06RN22 - The Social, Spatial and Physical Environments of Risk Perception

Chair(s): Christian Bröer (University of Amsterdam)

### Cozy Smoke? The Role of Attitudes and Knowledge in Public Perception of Wood Smoke as an Environmental Health Risk

Sari Ung-Lanki, National Institute for Health and Welfare | [sari.ung-lanki@thl.fi](mailto:sari.ung-lanki@thl.fi)

Timo Lanki, National Institute for Health and Welfare | [timo.lanki@thl.fi](mailto:timo.lanki@thl.fi)

Environmental factors have a significant impact on human health worldwide. In the

developed countries, fine particulate air pollution (PM<sub>2.5</sub>) has been identified as a main

contributor to the environmental burden of disease (EBD), together with radon, passive smoking, UV-radiation and noise. As knowledge on health impacts of various environmental factors has increased, understanding public perception of these risks – the ways in which people construct their own recognition of risks, reflect the messages they receive and deal with the risks – has become elemental in risk communication and management. This study is based on the research project on public perception of environmental health risks in Finland (N=1112), and examines diverse factors associated with health risk perception in the case of residential wood smoke. The average contribution of wood combustion to fine particles (PM<sub>2.5</sub>) ranges from 31% to 66% at the suburban sites in the cold season (Saarnio

ym. 2012), yet wood smoke is perceived substantially less harmful for both personal and general health than air pollution from other sources. Similarly, people are not that annoyed by, or sensitive to wood smoke than to traffic-related air pollution. Associations between wood smoke and certain chronic diseases are not well acknowledged. These issues, together with the notions that small scale wood combustion holds a considerable cultural value to Finns, and is perceived as a significant renewable energy source in households, make it interesting to compare the role of attitudinal and knowledge-based factors related to wood combustion with variables (perceived exposure, sensitivity, perceived health and background variables) associated with risk perception in general.

## Comparative Analysis of Environmental and Technological Risk Perceptions: Factors and Contexts

Aistė Balžekienė, Kaunas University of Technology | [aiste.balzekiene@ktu.lt](mailto:aiste.balzekiene@ktu.lt)

This presentation will explore the perception of various environmental and technological problems in comparative international perspective. This presentation is using the results of International Social Survey Programme “Environment” module that was conducted in 2010 in 32 countries around the world. Lithuania participated in the module for the first time that creates an opportunity to analyze risk perceptions in comparative international perspective. The analysis will elaborate on the local contexts and determining factors in different countries that frame public perception of environmental and technological risks. The survey results

revealed that public perceptions of the most important environmental problems are closely related to the local contexts and local issues. For example, people in Switzerland are mostly concerned with the storage of nuclear waste, people in Japan are mostly worried about climate change, and Lithuanians are anxious about air pollution. This presentation also will examine structural, contextual and attitudinal factors that frame public risk perceptions of such issues as air pollution caused by cars and industry, water pollution, pesticides and chemicals used in farming, climate change, GMO and nuclear power, as provided in ISSP questionnaires.

## Spatializing Global Risk: Regulating Pandemic Circulation

Sven Opitz, Hamburg University | [sven.opitz@wiso.uni-hamburg.de](mailto:sven.opitz@wiso.uni-hamburg.de)

This paper looks at the regulatory geographies of pandemic risk. It takes as its premise the importance of discourses on future emergencies for the emergence of spatial frameworks. As Michel Foucault has pointed out, modes of ordering space have often been devised as governmental answers to perceived threats towards public health. The paper analyses how the perception of pandemic risk in the last decade has functioned as an instance for rethinking governmental rationalities that work mainly through a legal-administrative logic. As will be argued, these legal regulatory frameworks, such as the International Health Regulations (IHR) of 2005, articulate two distinct, albeit connected, spatialities of risk governance. The first one is a space of global circulations. SARS has been coined as being the “first post-Westphalian pathogen” since the dynamic of viral contagion

transgresses the territorial order of modern political space. The discourse on pandemic risk articulates a regulatory space that depicts a globe full of dangerous transmission routes subject to dispersed networks of biosurveillance. At the same time, this global space is fragmented by zones of intensified governmental control at infrastructural nodal points such as airports and harbors. In these zones of control, technologies of screening and quarantine are applied to modulate the connectivity of people, organic matter and things. Processes of de- and re-territorialization, thus, fold into each other when it comes to acting on an uncertain, potentially catastrophic future. As a whole, the paper seeks to further the understanding of how risk perception is instrumental for articulating a spatial order of the globe by employing law as a regulatory technique.

## a07RN22 - Health Risks: Processes of Definition and Categorisation

Chair(s): Renata Motta (Freie Universität Berlin)

### Psychosocial Health of Residents Exposed to Urban Groundwater Contamination

Frederic Vandermoere, University of Antwerp | [Frederic.Vandermoere@ua.ac.be](mailto:Frederic.Vandermoere@ua.ac.be)

Josephine Foubert, Ghent University | [Josephine.Foubert@UGent.be](mailto:Josephine.Foubert@UGent.be)

Mainstream research within the field of ‘risk studies’ tends to focus exclusively on ‘risk’. As recently noted by Judith Green (2009, p. 495) this indeed questions the extent to which a risk-framing “pre-empt[s] the questions we ask and the answers we generate.” Against this background we explore psychosocial responses by residents confronted with groundwater contamination in a Belgian neighborhood. Particularly, we focus on the

role of risk perception and communication in explaining the psychosocial health status of the affected residents. Using a mail survey design (N=138) it is shown that the mental health status of these residents does not significantly differ from a non-exposed group. In a second step it is shown that risk perception has a negative effect on mental health, yet only if residents received information about the contamination through neighbors or public

meetings. Low to moderate concerns about the health risks of groundwater contamination relate to the fact that the impact of the contamination on people's everyday practices was limited. As the main potential exposure route requires the use of groundwater, residents felt able to control the exposure route and the resulting health risks, despite the fact that many people recognized the presence of hazards. Additional interview data

reveal that other local concerns were of greater importance to many residents (e.g. lack of parking space, litter or illegal dumping, road traffic congestion, etc.). In sum, this case study reveals that insights into broader community dynamics can provide a new contextual layer to interpret low to moderate perceived risks on the one hand, and the potentially limited psychosocial impact of chemical exposure on the other.

## **"The Making and Unmaking" of Risk: Risk Experiences and Practices Related to Asbestos Fibre Exposure in Two Italian Urban Contexts**

**Agata Mazzeo**, University of Amsterdam | [agata.mazzeo@gmail.com](mailto:agata.mazzeo@gmail.com)

I propose a reflection on dynamics and practices related to risk perception concerning the danger of breathing asbestos fibres. I conducted my fieldwork in two Italian cities, Bari and Casale Monferrato, sites of two asbestos-cement factories: Fibronit, and Eternit respectively. Risk perception is a process influenced by various factors. First, I discuss strategies adopted by those who hold political and economic power to deny the danger of breathing asbestos dust and who created conditions by which workers and citizens remained unaware of risk. Biomedical knowledge has recognised that asbestos fibres cause cancer since the 1960's (Selikoff 1965); nevertheless, difficulties of recognizing the exact polluting source and reconstructing the story of one's exposure have been used to delegitimize denunciations made by citizens and workers around the world. Second, I

compare data collected in Bari in 2009 to data collected in Casale Monferrato in 2012. I take into account the practices emerging from the context in Bari, where for the most part people did not perceive that they are at risk from asbestos. Are these practices different from those in Casale Monferrato, where almost everybody is highly aware of being exposed to asbestos fibres leaking from the largest Eternit (asbestos) plant in Italy? Is risk perception influenced by the judicial verdict declaring that Casale Monferrato is a city affected by an environmental disaster related to asbestos? Third, I explore what it means to live with risk. I take into account how social actors through their bodies, and socio-political actions experience risk and how a risk category can trigger new meanings about one's body, and existence.

## **Natural, Homemade and Real – Undoing Risk while Doing Food**

**Elin Montelius**, Mid Sweden University | [elin.montelius@miun.se](mailto:elin.montelius@miun.se)

In this paper I explore intersections of risk, gender and class in internet postings. In contemporary society there is a heightened awareness about what food is the "right" thing to eat and what one should avoid, due to contemporary discourses of food and risk. The notion of risk carries with it a notion of

responsibility, the responsibility to choose right. Risk is viewed as a technology of the self, and discourses about food and risk as part of normalizing processes. The results show that people negotiate the meaning of food as risky or not. The writers draw on discourses of food where the homemade food is viewed as natural

and healthy, and the ready-made food is viewed as unnatural and risky. The categorization of different food stuffs has implications for the subject positions that are available, since the positioning of certain food as risky positions the eater of that food in certain ways. A normative conception of femininity seems to be interconnected to the

regulation of food risk. The struggle for definition of food as risky or not is thus also a struggle for respectability, a struggle over moral authority and the attribution of value to different subjects according to their ability to present themselves as responsible and risk avoiding in accordance with the norm.

## **b07RN22 - Governing Nuclear Energy Production**

Chair(s): Paolo Crivellari (University of Toulouse)

### **Signaled and Silenced Aspects of Nuclear Safety**

**Marja Ylönen**, University of Jyväskylä | [Marja.k.ylonen@jyu.fi](mailto:Marja.k.ylonen@jyu.fi)

Nuclear safety has become an important topic after the Fukushima nuclear power accident. The disaster set in motion an international learning process, such as the stress tests carried out in Europe to reassess the robustness of nuclear power plants. Besides, the International Atomic Energy Agency as well as the OECD Nuclear Energy Agency have addressed safety matters and called for efforts to improve nuclear safety. Previous study, conducted by the author of this abstract shows weaknesses in prevailing safety concept.

Human and organizational aspects of safety have been reified to individuals' performance and qualities. This kind of understanding, although relevant, cannot capture the complex reality of interactions at the organizational level. In this paper I will deploy the concepts of dominant co-operative scheme (Buchanan 1996) and meaning-boundaries as analytical tools for exploring the safety aspects that are either signaled or silenced in the safety reports of the IAEA and the OECD NEA. The method of study is content analysis.

### **Nuclear Issue, Risk and Design of "Confiscation of Democracy". The Italian Case**

**Davide Borrelli**, University of Salento | [davide.borrelli@unisalento.it](mailto:davide.borrelli@unisalento.it)

**Mihaela Gavrilă**, Sapienza University, Rome | [mihaela.gavrila@uniroma1.it](mailto:mihaela.gavrila@uniroma1.it)

**Sarah Siciliano**, University of Salento | [sarah.siciliano@unisalento.it](mailto:sarah.siciliano@unisalento.it)

The economic crisis is affecting the patterns of political governance because of the compression of public arenas about the issues concerning quality of life and energy supply. The Italian controversy on the energy matter is emblematic of two increasingly obvious phenomena: in contemporary democracies, we find plans of emptying some of the democratic institutions, clashing with attempts of re-

appropriation of spaces of democracy from below: on the one hand, the deficit of social and cultural legitimacy suffered by political institutions, on the other hand, the design of "confiscation of democracy" in which the policy maker tries to counteract prior instances of deliberative participation advanced by the public opinion. Virtually ignored by mainstream media, the debate on nuclear power has been

in the middle of a dense network of conversations from below, which eventually affect public opinion. The success of the referendum on the nuclear issue enshrines the internet as an alternative political engine and, at the same time, a tool of “self-summoning” for the citizens. By comparing data on old and new media, it’s shown how networked conversations have ended up conditioning the media agenda and affecting the public opinion by the conveying of values and interests once

alien to the interpretive framework in which the case was politically orchestrated. The still unresolved issue concerns the affinities and semantic break between old and new movements in terms of communication strategies used to achieve consensus and to overturn the status quo. It remains to understand how the media platforms will transform themselves to meet the challenge of energy emitted by these social forms of civic engagement.

## Is Long-Term Nuclear Waste Repository Governance in Need of a Plan?

Catharina Landström, University of East Anglia | [c.landstrom@uea.ac.uk](mailto:c.landstrom@uea.ac.uk)

Anne Bergmans, University of Antwerp | [anne.bergmans@ua.ac.be](mailto:anne.bergmans@ua.ac.be)

As national strategies for siting deep geological disposal facilities for high level radioactive waste and spent nuclear fuel are being transformed into more democratic procedures, involving local participation, new socio-technical challenges arise. In this paper we address the intriguing absence of discussion of long-term management and governance of repositories, questioning the extent to which the initial concept of geological disposal, as ensuring both the isolation of waste in geological formations and its geographical separation from human societies, still holds. Even if physically at a relative distance (although even that may not be the case everywhere), voluntary, and other more participatory siting processes that presently show some promise of leading to the implementation of geological disposal, create proximity between the host community and the

disposal facility. This makes the extreme long-term less important than the much nearer future in which repository operations and closure are scheduled to take place; particularly given the fact that this process in itself is likely to stretch over several generations. However, while national strategies and policies provide clear guidelines for how to negotiate and decide on the siting of repositories, they are less clear on long-term governance after siting. This paper will explore the consequences of implementing and operating these controversial facilities (characterised by a remaining and unavoidable degree of uncertainty as to their future behaviour) in democratic social environments in which concerned actors and affected citizens will claim their right to be informed and have a say about what decisions are made.

## a08RN22 - Risk and Processes of Responsibilising

Chair(s): Patrick Brown (University of Amsterdam)

### The Job of Being at Risk. A Qualitative Study on Womens Managing Genetic Risk of Cancer in Everyday Life

Maria Caiata Zufferey, University of Geneva | [M.CaiataZufferey@unige.ch](mailto:M.CaiataZufferey@unige.ch)

Since fifteen years, genetic tests are available to identify the predisposition for breast and ovarian cancer due to specific gene mutations. Sometimes healthy women get tested. In case of adverse results, they receive a probabilistic information: they know that they carry the mutation associated with the illness, but they don't know if the illness is going to develop. Once classified as being at-risk, these women encounter an implicit social imperative to exercise control in order to maintain health. They are thus required to conceive health as a project to be worked on, and they are expected to manage risk in their daily life. Yet, the way they are supposed to do it is far from being clear. International guidelines were defined to assist patients' decisions, but they are far from

being shared by all physicians and are not easy to apply in daily life. Genetically at-risk women are then required to manage their health status in a context of great uncertainty. This paper provides insights into the process of managing genetic risk in daily life. Drawing on semistructured interviews with 26 women genetically at risk of developing breast and ovarian cancer, it describes the difficulties the participants meet in managing genetic risk in daily life and it illustrates the main activities they have to perform to do it. Based on these results, we argue that managing risk in a context of uncertainty is a complex process that includes strong individual agency and reflexivity.

### Self-Care and Self-Regulation in Managing Genetic Risk

Tabea Eißing, Helmut-Schmidt University, Hamburg | [t.eissing@hsu-hh.de](mailto:t.eissing@hsu-hh.de)

Risk-calculation is a common tool in health care and medicine. In the context of biomedicine risk appears in a new shape: as genetic risks. Through predictive genetic tests a mutation can be identified which is associated with a higher risk of developing a disease in the future. The paper draws on experiences of women affected by a genetic risk for Breast and Ovarian Cancer drawn from the ongoing social science research project "Genetic Discrimination in Germany". How do these women manage the status of 'being genetically at-risk'? Numerous uncertainties go along with the genetic diagnosis. Predictive genetic tests don't make a statement if a person will fall ill at all or what shape the

course of the disease might take. Life plans may have to be negotiated in a new way. The question of inheritance arouses, too. Women ask themselves: 'Do I pass on the genetic predisposition to my children?' Added to this, the efficacy of available preventive measures isn't certain. I illustrate the ways of managing 'being genetically at-risk'. Perceptions, interpretations of genetic risk and practiced preventive behaviors are presented. Beliefs concerning genetic risk management and ideas of one person's responsibility for genetic risk are visualized. In the end I discuss: Do women embodied beliefs of being self-regulative, self-governing and responsible subjects like it is constructed in neo-liberal rationalities in

modern welfare states? What impact goes along with the embodiment of these rationalities for stance on one's own

responsibility for genes and health in the broader social context?

## **Private Versus Public Responsibility within Health Risk Management A Case Study: The Difficult Implementation of New Policies Preventing Dengue Fever Epidemics in Martinique and French Guyana**

Elise Mieulet, Aix-Marseille University | [elise.mieulet@gmail.com](mailto:elise.mieulet@gmail.com)

Cécilia Claeys, Aix-Marseille University | [cecilia.claeys@univ-amu.fr](mailto:cecilia.claeys@univ-amu.fr)

This paper proposes an analysis of risk management related to the epidemics caused by *Aedes aegypti*, vector of dengue fever. This analysis is based on a qualitative corpus of 70 interviews and direct observation conducted in Martinique and French Guyana, with residents and institutional actors. Epidemics associated with this mosquito are seen by the relevant institutions as a priority public health problem. *Aedes aegypti*, defined as a 'domestic' mosquito, has colonized artificial breeding grounds in gardens, plant pots, and in any small container. In addition, it has developed increasing genetic resistance toward insecticides. Therefore, traditional mosquito control methods, especially the large-scale spreading of insecticides began inefficient. In this context, during the last decade, the authorities have focused their activities on

prevention and information campaigns to raise awareness on the management of private space and the normalization of behavior. However they face recurrent passive or active resistances from the local population. Mobilizing traditional Foucault's theoretical framework regarding biopower and recent findings highlighted by Borraz and Gilbert (2008) related the "authoritarian disengagement of the State", this presentation analyses the tension between private and public responsibility within the implementation of new health risk policies. Firstly, the construction of dengue epidemics as a contemporary public problem will be studied. Then secondly, the forms of reception and appropriation/non-appropriation of public communication and awareness campaigns by the population will be analyzed.

## **From the Sociology of Risk to the Sociology of Responsibility. Interpretations, Links, Fields of Application.**

Barbara Sena, University of S. Tommaso D'Aquino, Rome | [barbarasena@tiscali.it](mailto:barbarasena@tiscali.it)

In the sociological literature the connection between the concepts of responsibility and risk has not yet been analyzed with due care and specificity (for example Kermisch, 2012; Lenk, Maring, 2001; Lenk, 2007). Both of these concepts, moreover, does not have an unambiguous definition and there is not a single interpretation of their relationship. In the technical analysis, the risk is mainly defined as a statistical value that presumes the

occurrence of undesirable events, which may or may not occur. At first glance, the connection between this strictly quantitative conception of risk and the notion of responsibility may seem weak, and this is why the notion of risk is totally disconnected from the actors who are at risk and thus the allocation of their responsibilities. That's the reason because often the concept of risk is not integrated with any notion of responsibility. In

addition, the responsibility is considered mainly from the ethical and philosophical point of view and it is often related to an individual and not to a group or the society as a whole. On this basis, the paper aims to analyze explicitly the link between the sociology of risk, as it has emerged in the international debate, and the sociology of social responsibility, which is still

to be explored and clarified especially as a reading of the phenomena of risk. The paper will outline the possible theoretical connections, but also will try to clarify in what areas this theory may find significant applications for the understanding of the social reality and the many problems associated with the risk society.

## RN23 - Sexuality

### 01\_23JS28JS33 - Sports, Gender and Sexualities (1)

Chair(s): Oktay Aktan (University of Dortmund), Michael Meuser (University of Dortmund), Alessandro Porrovecchio (University of the Littoral Opal Coast)

#### Women in Ice

Piroska Béki, Semmelweis University, Budapest | [beki@tf.hu](mailto:beki@tf.hu)

In the past decades women have begun to take up types of physical activity which traditionally used to be considered masculine. They appeared in previously one-gender team sports such as football or water polo, and nowadays they are also involved in ice hockey, canoeing, and are active in numerous combat sports as well. On the other hand, men have also entered sport fields previously only available for women, such as rhythmic gymnastics. By this, sport can be regarded not only as a scene of gender stereotyping, but also that of redefining the concepts of masculinity-femininity in the negotiating of gender relations. In his theory (1965) Metheny defined the social acceptance or refusal of women in sports on the basis of features like aesthetics, the frequency of physical contact and the level of physical stress, or the weight of equipment used. But have stereotypes

related to women in different sports changed by the beginning of the twenty-first century, and if they have, what particular changes can be traced? The presentation aims at introducing current results of a PhD research which examines gender stereotypes related to different sports. Data were collected from female representatives of Olympic sports via semi-structured interviews. Earlier pairs of sports, one of which was considered feminine and the other masculine were compared (boxing vs RG as examples of individual sports, handball vs volleyball as team sports). This time female ice hockey players' (N=21) and female figure-skaters' (N=12) opinions on their own sport and the other sport were investigated. We deal with differences in the childhood sport socialization processes and motivation of sport selection, etc. of the representatives of the two sport

#### Beautifully Violent: The Gender Dynamic of Karate

Chloe Maclean, University of Edinburgh | [s0822532@sms.ed.ac.uk](mailto:s0822532@sms.ed.ac.uk)

If sport is a domain used to construct and reproduce hegemonic masculinity (Connell, 1990), and violence particularly is constructed as an inherent 'duty' of masculinity (Bourdieu, 2001:53), then how do women place themselves within the mixed-sex training environment of karate? Through a combination of semi-structured interviews and observations, this study explores the gender

relations in Scottish karate, and how they both reproduce, and challenge, established ideas of gender. Karate is a sport societally understood to embody characteristics of conventional masculinity, but where men and women train and contend with one-another for sporting capital. Based on conceptions of the body, men are assumed a more 'natural' fit to karate and afforded higher status than women. Yet within

the mixed-sex training environment, men and women learn a mutual respect for one another as training partners who can improve one another. In this environment, karate is a sport where women can, and often do, outperform men, and in doing so, reconstruct notions of femininity, and the gender order. As such, karate does not simply reproduce hegemonic

masculinity. Rather, the tension between karate athletes learnt understanding of women karate athletes as strong fighters, combined with societal interpretations of women as weak, fragile, and aesthetically pleasing, constructs a gender arrangement where women are both subordinated and empowered simultaneously.

## **Gender in Equitation: "Now Go on and Grab her Really Hard by the Back of her Neck"**

Nicole Kirchhoff, Technical University, Dortmund | [nicole.kirchhoff@tu-dortmund.de](mailto:nicole.kirchhoff@tu-dortmund.de)

From a historical perspective, the relationship between man and horse has masculine connotations. This applies both to the domestication of the animal as well as to its use for economic and military purposes and for the staging of male domination. Dressage as a discipline of equestrian sport has its roots in the training of soldiers and horses and up to today employs a language in which domination and annexation of the animal body through the body of the rider are expressed in a sexualized form. This however appears in stark contrast to the current competitive practice, in which there is no separation between the sexes and to the observation that it is dressage of all sports which seems to be a typically female discipline. Starting from body and gender theory based on social constructivism, this

presentation would like to point out, using a single case study on a dressage rider, how the bodies of horse and rider are gendered in sport practice. On the one hand the empirical results refer to the tension between institutional gender equality in competition and to inequalities in the form of traditional language usage at the same time. On the other hand, the experience of one's own body and that of the horse as a "partner in sports" will be examined, focussing on the question how femininity is constructed and performed. Thus, the assumption is taken into account that the social construction of gender always implies a physical dimension, which must quite necessarily be included in sociological analyses.

## **Reconstruction of Gender in Sports Context**

Oktaç Aktan, University of Dortmund | [oktay.aktan@tu-dortmund.de](mailto:oktay.aktan@tu-dortmund.de)

Diana Lengersdorf, Technical University of Dortmund | [diana.lengersdorf@tu-dortmund.de](mailto:diana.lengersdorf@tu-dortmund.de)

The meaning of gender in sports studies is a major theme in social sciences. Next to the technical aspects of sports, the team formations and selection processes for the collective sports practice is a question of gender as well. The aim of the presentation is to introduce the theoretical frame of gender and sports studies with the aim of discussing the reflections of gender based interrelations

in sports. The main question is whether gender in its combination with sports contribute to re-definition and/or (re)perception of "gender". Another point of interest is to examine to which extent the competition among the athletes can re-constitute the male and female identities in sports context. The presentation includes an overview of some research approaches in studying not only gender but also other

dimensions of social inequality i.e. ethnicity, milieu, social class or religion in sports. The primary focus is to reconstruct the categories and dimensions of social inequality in their interwoven form. The individual and the collective self-presentation forms, perception

patterns and their relations with gender are some other phenomena in this area of research. The impact of these social constructions on everyday life relations and the staging attitudes will be investigated profoundly in the presentation as well.

## 01RN23 - Embodiment – Differently-Abled Bodies, Aesthetics and Sexuality

Chair(s): Rebecca Jones

### Disabled Women and Intimate Citizenship in Portugal

Ana Cristina Santos, University of Coimbra | [acsantos1975@gmail.com](mailto:acsantos1975@gmail.com)

Fernando Fontes, University of Coimbra | [fernando@ces.uc.pt](mailto:fernando@ces.uc.pt)

Ana Lúcia F Santos, Centre for Social Studies, University of Coimbra | [analucia@ces.uc.pt](mailto:analucia@ces.uc.pt)

The social construction of the impaired body as passive and dependent is conducive to a process of desexualisation, rendering disabled people inadequate for a full intimate life. The dominant biomedical model reinforces this process. Conversely, one cannot become a full citizen without the legal and social recognition of one's intimate citizenship, which encompasses sexual and reproductive dimensions. In a context that is particularly disabling, masculinised and male-oriented, such as Portugal, disabled women are discriminated as women and as disabled people. In addition, disabled women, as a minority within a minority, often face multiple oppression on grounds of class, economic and educational status, age and sexual orientation. The reasons we chose sexuality and reproduction as analytical strands within intimate citizenship are threefold: 1) a

citizenship gap: these are central aspects of personal and relational wellbeing; 2) a political gap: sexuality and reproduction of disabled people in general, and women in particular, remain absent from national policy documents and official government reports; and 3) a scientific gap: within Portuguese academia, contributions in the field of Feminist Disability Studies are inexistent. Drawing on the research Project Disabled Intimacies: sexual and reproductive citizenship of disabled women in Portugal, funded by the Portuguese Foundation for Science and Technology (reference no. PIHM/GC/0005/2008) and developed at the Centre for Social Studies, Univ of Coimbra, since April 2012, in this paper we hope to share some of the early findings based on the literature review and original empirical data we collected in biographical interviews between January and February 2013.

## Shark Bites and Surgery: Personal and Social Meanings of a Scar for a 'New' Ageing Population

Karen Lowton, King's College, London | [karen.lowton@kcl.ac.uk](mailto:karen.lowton@kcl.ac.uk)

Chris MH Hiley, King's College, London | [chris.hiley@kcl.ac.uk](mailto:chris.hiley@kcl.ac.uk)

Paul F D Higgs, University College, London | [p.higgs@ucl.ac.uk](mailto:p.higgs@ucl.ac.uk)

Although lifesaving, the first childhood liver transplant recipients of the mid-1980s were left with one of the largest surgical scars possible after a single elective operation. Despite surgical approaches improving for later cohorts, it remains an extensive scar. Through analysis of interviews with 27 now-adult survivors of the first cohort of childhood liver transplant recipients in Europe, we report the heterogeneous personal and social meanings they ascribe to the scar as they age. Likened by participants to a map, maze, or war zone, it is both a welcome and a feared starting point for many personal narratives including ones of sexuality. It is evidence of illness and recovery; a reminder of being both close to death and of survival. At times across the lifecourse a scar was just one problem among many, often related to other physical side effects of medical care. Cosmetic revision may

have been offered or sought in early adulthood, enabling psychological adjustment to a potentially compromised body image, or conversely being perceived as showing ingratitude to the donor or trivialising one's own survival. In intimate contexts the scar had to be hidden, carefully explained, or wilfully displayed. To deflect direct enquiry from strangers or new acquaintances, 'heroic' but evidently 'nonsense' stories were recounted, commonly featuring survival after shark attack in exotic locations. Deliberate exposure expressed trust in a new friend or partner, or pride in their story or hard won self-confidence. We show that debates around body modification, sexuality and stigma need to take into consideration the role that bio-medical procedures have in creating a basis for both interactional and cultural discourses around scars.

## Bringing Sexy Back – Reclaiming the Body Aesthetic via Body-Blogs and Self-Shooting.

Katrin Tiidenberg, Tallinn University | [katrin.tiidenberg@gmail.com](mailto:katrin.tiidenberg@gmail.com)

The internet has become a new form of sexual culture and resulted in new sexual spaces. It has transfigured sex, illuminated aspects of it so that they 'stand out from their equivalent social sexual interactions' and it provides a 'stigma suspending space', as well as a gap between thinking, doing, and being. Online, we can experiment with sexual behavior by engaging in it without actually doing it. One of such possible behaviors is 'being naked on the internet' i.e. posting self-shots of one's body in various states of undress. Constructing our narrative of embodied selfhood via self-images is a genre of fantasy, control and self-

enhancement. The stories (if they adhere with the 'intelligibility rules') of our embodied selves convince others and ourselves of who we are and that we are in control. Based on cyber-ethnographic material from a two-year field-research, a visual analysis as well as interviews with 'not suitable for work' bloggers and self-shooters on tumblr.com viewed via Koskela's concept of 'empowering exhibitionism', Waskul's 'erotic looking glass' and the 'docile body' of Foucault versus the 'reflexive body' of Giddens, this paper explores body-blogging as a practice of reclaiming power and control over one's embodied

identity. It focuses on blogging as control and self-affirmation, a therapeutic practice of accepting one's body and a way to create a safe place for exploring one's embodied identity in the body/sexuality-fascist mainstream cultural

space. In their self-images the bloggers construct themselves as 'beautiful', 'sexy', 'devious', 'more than just a parent and an employee' and as someone who 'likes their body instead of trying to not hate it'.

### Extreme Training and Self-Destruction in Mixed Martial Arts

Yann Ramirez, University Paul Valéry Montpellier III | [yann-ramirez@orange.fr](mailto:yann-ramirez@orange.fr)

Mixed Martial Arts (or MMA) is concerned by the sociology of bodily engagement. We can define combat sport like a deliberate destruction. A destruction of the "other", but also a self-destruction. Engagement in boxing and also in Mixed Martial Arts can strengthen social cohesion of young men with deviant behaviour and can break routinization of life and reaffirm masculinity. Body becomes extreme; a machine which moves away from the ideals of health. Competition degrades body. The cult of performance and the pressure of success increase risks. Doping is one of the consequences. The bodily engagement by the abuse of sport could be illustrated by a symbolical reunion between Eros and Thanatos: the fascination of the death danger. Construction and destruction are

mixed up, the risks are glorified and covered by a form of aesthetics. All percussion combat sports are violent, but MMA is not the more brutal one. Meanwhile the athletes fight inside a cage. Open-fingered gloves and strikes on the ground bring out a negative impression and barbarian image. Furthermore, scientific statistics show that MMA is less traumatic than American Football or Rugby. The problem is the visual impression with blood and spectacular minor injuries: cuts on the face, broken bones, dripping blood over bodies and fight shorts. Organization leaders are seriously taking care of competitors. Medical tests take place before the fight with blood test and the funduscopy. After the fight, a check up must define an appropriate medical suspension in case of noticed injury.

### Homosexual Gendered Body - Perception Inside and Outside the Sport: The Case of Poland.

Honorata Jakubowska, Adam Mickiewicz University, Poznań | [honorata@amu.edu.pl](mailto:honorata@amu.edu.pl)

In my presentation, I would like to discuss the differences in attitudes toward homosexual women and men in sports. I will focus on football – the national sport in Poland – perceived as the last bastion of masculinity. I'm going to take a look at attitudes of both players

and coaches as well as sports fans. This subject is interesting because any professional athlete has not revealed his homosexuality in Poland, while some artists (actors or dancers) as well as politicians have come out in recent years. It is hard to believe that there are no

homosexual people in sports, rather this area of social life is perceived as homophobic environment. The fear of coming out, however, what I would like to show, has gender-

dependent sources. Finally, I would like to point out some examples of positive changes taking place mainly in amateur sport.

## Tunisian Sportswomen between Modernity and Tradition

Jamoussi Benkhalifa Raja, University of Sfax | [raja\\_isseps@yahoo.fr](mailto:raja_isseps@yahoo.fr)

We have devoted our efforts in this research to provide some answers and offer further insights on the elite sports and on the status of sportswomen. We focus on the evolution of the mindset held by our society towards women in sports. To answer all these questions, we conducted a qualitative survey (31 interviews) and quantitative (412 questionnaires) with athletes (216 women and 216 men) who have earned medals in international competitions in various sports. The comparison between athletes enabled us all along this work to shed some light on convergences and divergences in sports, body and society. Our work shows that laws governing elite sports, sports facilities, sports education, and scientific supervision have enabled athletes some ascent to the top level. However, social class and the nature of

practiced sport played a more important role in the progression towards elitism. Tunisian women increasingly invest in 'high level' sports that are identified to strengthen economic potential, improve living standards, fight against inequalities, and lower poverty. These women engage in non-traditional practices, but they are neither in family conflict nor in rupture with the cultural circle. It seems easier and more acceptable for a girl to practice a «male» sport; nevertheless, there is a restriction on broadcasting the image of these sportswomen on television. Elite sportswomen still face resistance and social constraints, but their attitude of wanting to change the stereotypical representations of masculinity and femininity cannot be disputed.

## 02RN23 - Hetero-Sexualities

Chair(s): David Evans

### Is Putting Heterosexuality and Pleasure (in the Feminine) together a Contradiction in Terms? A Sociological Reflexion on Heterosexuality.

Ana C Marques, ISCTE/IUL, Lisbon | [achms@iscte-iul.pt](mailto:achms@iscte-iul.pt)

Articulations of gender and sexuality have been analysed for a long time now in sociological literature. After a first period of feminist critic on heterosexuality as "oppressive" for women and non-heterosexual men and women, and a battle on the pleasures and dangers of sexuality, heterosexuality was somehow forgotten and put aside in relation to more

cultural analyses on sexuality and gender. Back in the final decade of the twentieth century, the critics and/or analyses on heterosexuality re-emerged in the feminist and sociological debate. Heterosexuality was considered not just a social organizer for sexuality, but also as having implications on other arenas of social life, like work, family or

[social] policy. In this context Stevi Jackson (1996, 1999, 2006...) starts to rehearse the "theorising" of heterosexuality in sociological terms, having in mind that heterosexuality is a complex and multifaceted social phenomenon that cuts across different dimensions of social life, as the institutional, the cultural, the interactional and the subjective. However, a recent work by Beasley, Brook and Holmes (2012) brings into light a critic of the way heterosexuality has been analysed, especially, in terms of its oppressive and negative terms,

neglecting heterosexual everyday pleasures. Recognizing the "problems" of heterosexuality, the authors try to problematize and deconstruct what they consider to be a monolithic and static vision of heterosexuality. Drawing on Vance's (1984, 1991 [2007] and Jackson and Scott's [2010] critics of sex being considered as bad or good, and their appeal to analyse the meanings it has for individuals; in Jackson's efforts to analyse heterosexuality in sociological terms, and other sociological work

## Medicalising Male Sexual Underperformance: Social Campaigns and Expert Discourses on Male Sexual Health in Italy.

Raffaella Ferrero Camoletto, University of Torino | [raffaella.ferrerocamoletto@unito.it](mailto:raffaella.ferrerocamoletto@unito.it)

Francesca Salis, University of Torino | [francesca\\_salis@hotmail.it](mailto:francesca_salis@hotmail.it)

The "Viagra phenomenon" is a global case of the construction of masculinity through medicalised practices led by an alliance of specialized physicians' expert discourses and multinational pharmaceutical companies' marketing strategies. International literature has argued that medicalisation and pharmaceuticalisation, through the association between men's health and sexual potency, produce a new public discourse on masculinity, scripting a medicalised virilism. The analysis of discourses and practices regarding drugs enhancing male sexuality offers us an unprecedented opportunity to explore the local impact of the global construction of

masculinity. In Italy, since direct-to-consumer advertising of prescription drugs is not allowed, insistent social campaigns have been promoted by professional associations of physicians, often supported by both institutional bodies and pharmaceutical companies. By focusing on documentary material and in-depth interviews with medical experts involved in the check-up activities these campaigns provide, we will show how medical discourses, setting male sexual health as a new public issue, construct both the masculinity to be fixed and new forms of medical expertise.

## Two Responses to Androcentrism from the Early 20th Century: Charlotte Perkins Gilman and Georg Simmel.

Sonja Engel, Ludwig-Maximilians University, Munich | [sonjaengel@gmx.net](mailto:sonjaengel@gmx.net)

The women's movement around 1900 triggered a crisis for the existing binary gender system. My proposal for this paper is to bring together two scholars of the early 20th century who responded to this: Charlotte Perkins Gilman and Georg Simmel. They both claim that their cultural setting is androcentric, and both

publish this diagnosis in 1911. Yet their derivations and also their solutions differ remarkably. The issue of (hetero)sexuality functions as a culmination point in both constructions. Georg Simmel, a German sociologist, was a supporter of the (bourgeois) women's movement, yet he was still sceptical

towards the idea of equality. His views on gender are contradictory, oscillating between naturalizing and historicizing gender and sexuality. The issue of prostitution hinges on Simmel's considerations of gender and his theory of modern culture. On the contrary, Charlotte Perkins Gilman, an American sociologist and writer, is insisting on the notion of humanity and aiming at gender-equality. Her views on suppression and exploitation of women revolve around the notion of motherhood, manifested in her utopian novel

Herland. Here she is picturing a land inhabited only by women and reflecting upon the contingency of gender constructions and forms of sexuality. Concepts of sexuality as a central point of investigating gender relations have a history that has yet to be explored more fully. By comparing these two points of view and embedding them in the contemporary discourse, we gain insights in processes of negotiating the notions of nature and culture and their gendering that are still virulent today.

## **"I Have the Right to my Desires": Experiences of Submission in the Heterosexual Practices of Woman-Identified Feminists**

Nichole K Edwards, University of Leeds | [nichole\\_edwards@hotmail.com](mailto:nichole_edwards@hotmail.com)

Saba Mahmood argues that 'agentival capacity is entailed not only in those acts that resist norms but also in multiple ways in which one inhabits norms' (2005, 15). By exploring what the female subject is capable of as a lived body, rather than simply addressing the constraints she experiences as a gendered body, the female subject is afforded the capacity for a relationship with dominant norms that stems beyond simply reinstating or subverting them. This paper is based on PhD research which seeks to understand how woman-identified feminists experience pleasure and desire in their heterosexual relationships with men. 17 women participated in this study; each kept a diary of their sexual thoughts and experiences, which was then used to facilitate a discussion surrounding the role their feminist values play

in informing their sexual practices. This paper will focus on those experiences that play with elements of power, bondage, masochism and other kink practices whereby the participant actively engaged in a submissive role. Although discussions of choice are key to these women's understandings of feminism, in other words, 'it is not the substance of a desire but its origin which matters in judgments about autonomy' (Mahmood 2005, 12), in some instances these experiences were saturated with feelings of guilt as they questioned whether these sexual choices placed their personal identity as a feminist in crisis, and more importantly, open to critique. This paper seeks to explore such complexities and, in doing so, will argue for a more nuanced understanding of feminist heterosexualities.

## 04RN23 - Religion, Spirituality and Sexuality

Chair(s): Gerardo Zamora

### Sacred Sexuality and Gendered Empowerment in Contemporary Spirituality

Anna Fedele, CRIA - Lisbon University Institute | [annafedele@yahoo.com](mailto:annafedele@yahoo.com)

This paper is based on fieldwork in Spain and Portugal about the Goddess movement and its metamorphoses in traditionally Catholic countries. One of the main reasons that cause people to turn away from the Catholic religion they grew up with and to embrace the Goddess movement is the Catholic stigmatization of sex disjoined from procreation. The women (and few men) I encountered criticized the “Church” for its negative attitudes towards sexuality and the body (especially the female body). Through theories and practices they loosely described as “sacred sexuality” they gradually came to recognize their body as sacred and to conceptualize sexuality as a potential tool for spiritual enlightenment. Without dismissing

the empowerment that contemporary spirituality has been shown to bring about for certain women and men, I will demonstrate the importance of taking up an analytical perspective on gender and sexuality in contemporary spirituality, which does not take for granted the discourses of social actors. I will argue that in contemporary spirituality strategies of gendered empowerment often occur through a strategy of construction by opposition towards Christianity. Accepting certain dichotomies inherent in the Judeo-Christian worldview, spiritual practitioners often end up reproducing stereotypical ideas about the role of men and women that have been deconstructed by feminist scholars.

### “To See Sexuality as Divine, not as Something to Be Ashamed of, Hidden”: Religion and Spirituality in the Lives of LGBTQ Canadians

Brenda L. Beagan, Dalhousie University, Halifax | [bbeagan@dal.ca](mailto:bbeagan@dal.ca)

Brenda Hattie, Mount St Vincent University, Halifax | [brenda.hattie@msvu.ca](mailto:brenda.hattie@msvu.ca)

Religion and spirituality are often sources of solace, strength and resilience for oppressed communities. For those who identify as lesbian, gay, bisexual, transgender, or queer (LGBTQ), religion and spirituality are too often key sources of oppression and marginalization. In this paper we draw on qualitative interviews with 25 LGBTQ people on the East coast of Canada (Nova Scotia), to explore experiences and interpretations of spirituality and religion as they intersect with sexual orientation and gender identity. We examine the ways religions or lack of religious affiliation shaped the lives

and well-being of LGBTQ individuals. Drawing on notions of abjection (Kristeva) we explore the ways faith traditions contributed to the construction of the abject body for our participants, casting sex, sexuality and desire as shameful and polluting. Some participants attempted to use religion or spirituality to change their sexual or gender identities, at least initially. Some were outright rejected by faith communities, which always entailed considerable loss, including loss of community and family, as well as disconnection from their own faith, beliefs, and sense of spirituality.

Many participants, however, found ways to reconfigure their relationships to their bodies, their sexuality or gender, as well as their spiritual selves. Some rejected organized religion in favour of a more individualized version of religion. Some rejected faith traditions in favour of a less institution-based

spirituality. Some simply disengaged from spirituality and religion altogether. Unfortunately, just as LGBTQ selves were often unwelcome in religious communities, so spiritual selves were at times unwelcome in LGBTQ communities.

## 05RN23 - Sex Work

Chair(s): TBA

### Examining Knowledge about the Women Selling Sexual Services in Poland.

**Agata Dziuban**, Jagiellonian University | [agata.dziuban@uj.edu.pl](mailto:agata.dziuban@uj.edu.pl)

**Anna Ratecka**, Jagiellonian University, Cracow | [anna.ratecka@uj.edu.pl](mailto:anna.ratecka@uj.edu.pl)

In our presentation we will give a closer look to the different types of knowledge about sex workers in Poland. A variety of institutions (law enforcement bodies, medical institution, various state agencies, social services, NGOs) are engaged in the production of knowledge about female sex workers, especially street sex workers and women working in parlour agencies. This knowledge – determined by structural constraints, particular interests and interpretative strategies implemented by each of those institutions – legitimizes various actions dedicated to or directed towards women selling sex. The ‘institutional knowledge’ produced by different social actors creates stereotypes or certain models of women selling sexual services. The first aim of our presentation is to identify those models,

the image of female sex workers that emerges for them and the consequence it has for the actions directed towards them. Secondly, we will explore the knowledge based on the work of project for sex workers especially those engaging in social streetwork. The ‘field knowledge’ produced in the course of social work with women selling sexual services, is said to be an effect of negotiation between perspectives of streetworkers and beneficiaries of those projects and a way of giving female sex-workers relative control over the process of knowledge production. The empirical insight into the work of such projects will allow for the examination of the actual models of sex workers present in the field knowledge.

### Trapped in the Heteronormative Matrix – Sex Workers as Caring Mothers or ‘Abject Other’

**Carolin Kueppers**, Ludwig-Maximilians University, Munich | [Carolin.Kueppers@soziologie.uni-muenchen.de](mailto:Carolin.Kueppers@soziologie.uni-muenchen.de)

Ahead the Soccer World Cup in South Africa 2010, the media reported on how sex work will increase during the event. Notwithstanding

that this forecast didn’t come true, this assumption had a decisive impact on the media discourses on sex work that mostly functioned

through reproducing the binary of the 'whore-stigma' that divides women into either 'good' or 'bad'. Therein, sex workers can be analysed as 'abject other' against which various white female sexual identities are constructed. Sex workers as the 'others' co-constitute the representation of the feminine ideal of 'good wives' or 'decent women' and are rarely seen as who they are besides their occupation. On the other hand, a shift from the representation of 'other' to ordinary can be observed. Sex workers are accretive portrayed as caring

mothers, who sell sex as a necessity to support their children. In my paper I follow the hypothesis that representing sex workers as 'caring mothers' reconfigures them as part of the heteronormative matrix, which seems to be the only option to uncover them as human beings in the media discourse. I will undergrid this argument with personal narratives from interviews with sex workers that highly correlate with the media discourse, as the institution of heteronormativity leaves only limited representations for everyone.

## Just a Normal Job? Emotional Labor among High-Class Escorts in Germany

Anna E. Hägglund, Leibniz University, Hannover | [e.haeggglund@ish.uni-hannover.de](mailto:e.haeggglund@ish.uni-hannover.de)

Lea Kröger, Humboldt University of Berlin | [leakroeger@gmail.com](mailto:leakroeger@gmail.com)

Drawing on qualitative interviews, we analyze the emotional labor performed by women working part-time as high-class escorts in Germany. We examine the meaning attached to customer relations and the way in which these women create and maintain boundaries between their private and work identities. Overall, studies on sex work have predominantly analyzed street prostitution, although a growing string of research pays attention to emotional labor among sex workers in the indoor sex market. Yet the majority of the latter studies do not raise the question whether the specific setting shapes the demand and form of emotional labor. To understand the role of the setting in commercial sex, we elaborate on high-class escorts, addressing the specific working conditions and their consequences for boundary work. The preliminary results

confirm that both independent escorts and women working for escort agencies distinguish their activities from other forms of prostitution. Furthermore, strategies for differentiating the private self from the work identity, which have been detected by prior research on indoor sex work, are not prevailing in the material. Instead, the boundary drawing process appears to be ambivalent. While escorts use appearances, clothing as well as made-up background stories to construct a professional self that inspires erotic fantasies in the customer, they experience difficulties maintaining that role. In this sense, customer relations are described in terms of authenticity and friendship. In addition, they stress that the main demand of their job lies in the social experience of the date, rather than the sexual act itself.

## 06RN23 - Sexual Citizenship/Sexual Politics

Chair(s): Andrew King

### Sexual Health Indicators among Young People in Northern Ireland. An Update on Recent Research Evidence and Policy Debates

Dirk Schubotz, Queen's University, Belfast | [d.schubotz@qub.ac.uk](mailto:d.schubotz@qub.ac.uk)

Britain boasts one of the most comprehensive sexual attitude and lifestyle surveys in the world (NATSAL), but all efforts to convince policy makers and academics to extend the survey to Northern Ireland have been unsuccessful. The results of the latest NATSAL survey are due to be published in autumn 2013, and yet again we will remain in the dark about sexual attitudes and lifestyles of the adult population in Northern Ireland. This is significant as Northern Ireland's devolved government continues to take sexual health policy decisions in the absence of empirical evidence, yet claiming that people in Northern Ireland think and behave differently from their mainland British counterparts when it comes to their sexuality and sexual lifestyles. Thus sex-negative as well as hetero-normative or

even homophobic debates repeatedly flare up in discussions about the legislation of pregnancy termination, the adoption law or even who should or should not be allowed give blood. In the absence of large scale sexual health data in Northern Ireland, we included questions on sexual behaviour in the 2011 Young Life and Times (YLT) surveys. YLT is an annual randomised postal survey of 16-year olds undertaken in Northern Ireland by ARK ([www.ark.ac.uk](http://www.ark.ac.uk)). In this presentation I will report key findings of this survey with regard to key sexual health indicators, such as experienced intercourse, contraceptive use, level of regret, number of partners etc. I will relate these to the most recent mainland British data and the on-going policy discourse about Northern Ireland being 'different'.

### Coping with Antigay Violence: In-Depth Interviews with LGB Adults

Lies D'haese, Ghent University | [Lies.Dhaese@UGent.be](mailto:Lies.Dhaese@UGent.be)

Alexis Dewaele, Ghent University | [Alexis.Dewaele@UGent.be](mailto:Alexis.Dewaele@UGent.be)

Mieke Van Houtte, Ghent University | [Mieke.VanHoutte@ugent.be](mailto:Mieke.VanHoutte@ugent.be)

Belgium is one of the guiding countries concerning LGB rights compared to other European member states. Accordingly, public attitudes toward sexual minority individuals are relatively tolerant. Nevertheless, antigay violence does exist in Belgium. Moreover, previous empirical and theoretical work has suggested that antigay violence results in more thorough negative mental health outcomes compared with violent incidents that are not directed against personal characteristics. Given the possible negative mental health

outcomes and the limited understanding of how sexual minority individuals cope with antigay violence, we are interested in the coping strategies that victims adopt and the sources of social support that they address. A qualitative research strategy was used to explore the field. Seventeen in-depth interviews with sexual minority victims of verbal, physical, material and/or sexual violence were conducted to outline their experiences and the aftermath of antigay violence. Semi-structured conversations made

clear that antigay violence can have several physical and emotional consequences. Emotional consequences range from fear and anger, to feelings of shame, depression and low self-esteem. Nevertheless, a number of the respondents reported that they want to live their own life, instead of being ruled by

homophobic acts from the past. Proactive behaviour changes, such as no longer holding hands or kissing in public, can be seen as negative outcomes of antigay violence or as a coping strategy to avoid future incidents, next to searching for social support in one's own environment.

## Youth Organizations and Contemporary Sexual Culture: Comparative Analysis of Europe and Russia

Liliia S. Pankratova, St. Petersburg State University | [lilia.pank@gmail.com](mailto:lilia.pank@gmail.com)

At the modern stage of the development of contemporary societies the scientific community talks about the existence of such specific historical socio-cultural context which led to the appearance and spread of various, diversified types of sexual culture or even sexual cultures. It is the result of the influence of quite a large number of factors and social actors of different levels: macro level processes and changes, as well as social agents and institutions, interpersonal and group interactions on the micro level of the everyday life. In order to broad our understanding of the mechanisms and ways,

character and specificity of formation of contemporary sexual culture we study the role and influence of youth organizations in Europe and Russia on this process. In this paper, based on the content-analysis of the documents and activities of different kinds of youth organizations (LGBT, feminist, religious, etc.) from both regions, it is shown the specificity and key directions of their contribution towards the development of various discourses around sexuality and youth sexual way of life. Undoubtedly it is greatly determined by socio-political and cultural conditions in each society.

## Sexualities Equality Training for 'Youth Professionals': What's Known Internationally?

Pam Alldred, Brunel University | [pam.alldred@brunel.ac.uk](mailto:pam.alldred@brunel.ac.uk)

Malin Stenstrom, Brunel University | [malin.stenstrom@brunel.ac.uk](mailto:malin.stenstrom@brunel.ac.uk)

Fiona Cullen, Brunel University | [Fiona.Cullen@Brunel.ac.uk](mailto:Fiona.Cullen@Brunel.ac.uk)

This paper will present the findings of a review of the literature on training to support professionals to conduct sexuality equalities work with young people. The urgency of engaging professionals, such as teachers, in tackling homophobia can easily lead to the circulation of common sense notions about how it should be done, but what is known about the efficacy of educational interventions? And how therefore should training be offered teachers? The literature surveyed will be pan

European but is likely to speak particularly from the language cultures represented in this project: Spanish, Italian and English, with Irish, Hungarian and Serbian literatures examined too. The project as a whole will draw lessons from both feminist anti-domestic violence, and specific anti-homophobia and -transphobia work. The rationale for drawing these distinct strands of equality work together is that interventions against gender normative ideas, or targeting cultures of disrespect (for sexual

consent etc.) or promoting respect might simultaneously undermine both types of problematic behaviour. The impetus behind this is to reduce the cultures that sustain violence among young people by enabling youth professionals to better intervene in peer cultures, as well as to enable professionals to

more clearly identify when to refer to specialist services. The review will be conducted at the first stage of a four-country project funded under the EU DAPHNE programme, and will draw on expertise beyond the partner countries, specifically seeking out NGO, as well as academic knowledge.

## **a06RN23 - Sexual Citizenship/Identities/Intersections**

Chair(s): Robert Pralat

### **LGBT Sexualities and Migration**

**Bernadetta Siara**, City University, London | [bernadetta\\_siara@yahoo.co.uk](mailto:bernadetta_siara@yahoo.co.uk)

My paper will focus on LGBT sexualities and migration. It is based on research done with Poles who arrived into the UK within the last few years. Such a focus is important as 686,000 Poles had arrived into the UK since May 2004 (Home Office 2009). This paper will look at how this migration influences views of Poles on sexualities and how they experience the sexual environment in the UK. Poles migrate from a context, where particular forms of sexuality are promoted and as a result many sexual rights are not accessible such as the possibility to register a same-sex civil partnership or to adopt a child by same-sex couples. Moreover, homophobia is still prevalent and such a sexual context is also influenced by the state policies as well as the Catholic Church's rhetoric.

However, the LGBT movement is actively working to change this situation. Poles migrate to a context which is more secular and where some sexual rights mentioned above are accessible, even though homophobia is still prevalent to some extent. Therefore, it is interesting to look at how this migration influences views of Poles and how they experience a different sexual environment in the UK. The research showed that for many Poles migration to the UK provided an opportunity to observe different sexual arrangements that in some cases led to changes in their views on sexualities. Moreover, some gay Poles gained an opportunity to 'come out' once in the UK and live their sexuality 'out in the open'.

### **News, Activism and Cultural Impact: Media Representations of Sexual Diversity in Portugal**

**Ana Cristina Santos**, University of Coimbra | [acsantos1975@gmail.com](mailto:acsantos1975@gmail.com)

This paper examines the cultural role of print and broadcast media, in particular the ways in which news discourse represents lesbian, gay, bisexual and transgender (LGBT) activism in Portugal and how those representations have changed over the last decade. Newspapers and

TV channels, as powerful social forces, play a central role in producing, disseminating as well as challenging dominant perspectives about LGBT people in general, and LGBT activists in particular. By doing so, they hold the ability to both generate socio-cultural

change or to reinforce existing stereotypes. Based on my most recent book, I begin this paper with a brief outline of the LGBT movement within the sociopolitical context of Portugal. I then move on to the news world, examining three specific frames used by the media to report LGBT events: the

entertainment frame, the reliable source frame and the homophobic/transphobic frame. The last section considers the ways in which the LGBT movement has dealt with the media, focusing on successful approaches used by activists in order to achieve visibility, get credibility and generate empathy.

## Struggles for Change. Developing the Concept of Sexual Citizenship in Poland

Ewelina Ciaputa, Jagiellonian University | [ewelinaciaputa@gmail.com](mailto:ewelinaciaputa@gmail.com)

Many studies suggest that Polish national identity and concept of citizenship are still founded on the basis of ethnicity and religiosity. Nationalist discourse in Poland generally defines women as mothers and wives which determines the conditions under which women may belong to the nation and indicates the roles that should be filled by them in the first place. Public debates about women sexuality in Poland can be seen as political struggles for meaning of and social control over women's reproductive and sexual rights. In addition, as Agata Chelstowska states "in the past 20 years, Polish governments have gradually limited the reproductive rights of women and treat them as an area of political game" (2009: 11). Not surprisingly, recently we

can observe increased activity of various feminist organizations whose main goal is to resist manipulation and control which is exercised over women in the state. Thanks to various activities organized for example by The Federation for Women and Family Planning as well as Group of Sex Educators "Ponton" women gain self-awareness that is the basis for creating a new sense of self, of solidarity and of belonging to a community. In my paper I would like to demonstrate the development of sexual citizenship in Poland, particularly by referring to activities organized by different feminist actors since 1989 and to contemporary debates on sexual politics in Poland that can be seen as struggles for the reconfiguration of citizenship.

## "Butch, Behaving Like a Man": Gender and Violence in Lesbian Relationships

Alzbeta Mozisova, Masaryk University, Brno | [mozisova@mail.muni.cz](mailto:mozisova@mail.muni.cz)

This paper is based on preliminary results from a mixed quantitative–qualitative study on intimate partner violence in lesbian relationships in the Czech Republic. The pioneering study was designed to understand the experiences and attitudes of lesbian, bisexual and queer women towards partnership violence. Drawing on a feminist framework the paper focuses on the intersections of gender and sexuality in lesbian intimate partner violence. Results from over

200 questionnaires with LBTQ women and several in-depth interviews with women who have experienced relationship violence in a same-sex relationship are examined with a particular focus on the ways in which violence is understood in relation to gendered expectations and gender-role stereotypes. The study presents implications for the relevance of the gender-based framework in theorizing and researching this type of violence.

## c06RN23 - Sexual Citizenship

Chair(s): Andrew King

### Gender, Sexuality, and Religious Tradition: “Culture Wars” in Putin’s Russia

Maxim Kupovykh, University of Amsterdam | [M.Kupovykh@auc.nl](mailto:M.Kupovykh@auc.nl)

Contemporary society is in the midst of the new round of “culture wars” in which religions and churches are significant players and arenas of struggle. Triggered by the advances in women’s and gay’s rights and by the increased public awareness of the path-breaking advances in science and technology (e.g. reproductive technologies and genetic engineering), this round of the “wars” challenges religious communities to reinvent their “traditions” in more fundamentalist or more liberal ways. Taking the widely publicized in 2012 case of the Pussy Riot trial as a point of departure, this presentation explores the “rules of engagement” between various secular and religious publics in the Russian public sphere over the nature and ethics of

human intimacy, sexuality, and gender. The particular focus is on the role of the Russian Orthodox Church in these debates and on the hybrid phenomenon of “liberal traditionalism,” a slightly counterintuitive (from the Western perspective) position which combines political liberalism with considerable opposition to the feminist and gay rights causes. The presentation argues that the current Russian “culture wars,” characterized by extreme ideological polarization, explicit links to “big politics” and considerable “symbolic” and physical violence, represent not only one of the worst case scenarios of the more global processes but also throw additional and often unanticipated light on the less visible aspects of the global conflicts.

### Rethinking Transnational Queer Migration and Intimate Citizenship

Francesca Stella, University of Glasgow | [francesca.stella@glasgow.ac.uk](mailto:francesca.stella@glasgow.ac.uk)

Despite a burgeoning literature on transnational migration, relationships and intimacy, the experiences of non-heterosexual migrants remain under researched, particularly in Europe. Existing literature indicates that sexuality can be a key motive for both internal (Weston 1991; Cant 1993; Gordon-Murray 2009) and international migration (Manalansan 2003, 2006; Carillo 2004; Mai 2012). Mobility and migration have been seen as key strategies enabling queer practices, identities and subjectivities (Cant 1993; Weston 1991; Espin 1997), a notion embedded in widespread narratives of migration as a journey from ‘homophobic’ to more ‘progressive’ countries, from rural areas to queer-friendly urban centres and queer communities (Fortier 2001). However, the view

of migration as an emancipatory strategy has been critiqued as teleological and for failing to take into account barriers to international migration and the potential exclusions faced by queer migrants in the host society (Manalansan 2003; Cantu’ 2009). Moreover, the prevalent emphasis on queer identities and subjectivities has allowed for a limited exploration of the role played by wider personal communities (Pahl and Spencer 2004), including kinship and migrant networks, in the process of migration and settlement. The paper explores approaches which may enable a more holistic understanding of ‘the sexuality of migration’ in a European context, sensitive to the complexities of queer migrants’ diverse subject positions, motivations and experiences. The paper brings into conversation different

strands of literature, in particular work on international migration, transnational

citizenship, migrant social networks, and kinship and friendship networks.

## **To Be or not to Be a (Lesbian) Mother? Juridical Ambiguities in the Definition of the Parental and Reproductive Rights' Beneficiaries**

Tânia C. S. Machado, University of Minho | [taniacsmachado@gmail.com](mailto:taniacsmachado@gmail.com)

Regarding the development and enforcement of European policies in the fields of science and technology, Portugal distances itself from EU countries concerning the parameters that regulate the application and use of assisted reproductive technologies, and, therefore, the concept of sexual citizenship. In Portugal, the socially legitimate and legally regulated conditions to access new reproductive technologies converge with dominant representations of family, motherhood, fatherhood and sexuality, underlying which one finds a set of conceptual associations (i) between marriage and parenting, (ii) (hetero)sexuality and procreation, (iii) marriage and heterosexuality and (iv) parenting and (hetero)sexuality. According to the Portuguese law ruling the access and application of reproductive technologies, lesbian couples are prevented from requiring medical-

technological care in order to have a child, although one of the requisites to access medically assisted reproduction is to be married, or to live in cohabitation for at least two years, and despite the fact that civil same-sex marriage has been legalized in 2010. Through the analysis of the discourses of judges interviewed about this question, this paper highlights the juridical ambiguity concerning the definition of the "ideal couple" regarding parenting: for some, reproductive and parental rights must only be granted to an ideal-type of a legitimate, "better" (heterosexual) couple; for others, lesbian couples must also have access to medically assisted procreation in order to benefit from a global female right – motherhood. This leads to the emergence of different concepts of sexual citizenship, which will also be highlighted.

## **How Does Love Work? – Love in Relational Practices and Sexual Politics in Poland**

Agata Stasinska, Polish Academy of Sciences, Warsaw | [agatastasinska@wp.pl](mailto:agatastasinska@wp.pl)

Recently, there has been an ongoing shift in Polish LGBT politics, from 'coming out and visibility' to the politics underlining the subjectivity of the non-heterosexual relationships (Kulpa, Mizielińska, Stasińska 2012; Stasińska 2013). Particular emphasis is placed on 'love' as a new LGBT/queer strategy of NGO activism or independent social campaigns. Is this change also reflected in narrations of non-heterosexual people in Poland? What does 'love' mean in their experiences and relationships? What is the role of 'love' in their narrations on sexual

identity? Is 'love' a mere feeling or can it be a political concept reaching beyond the individual life trajectories? In my presentation I would like: (1) to engage with the recent discussions about same-sex relationships in the 'West' and beyond; (2) to recall narratives of 'love' from interviews with Polish non-heterosexual couples. I would also like to ponder on the possibility of reading 'love' as queer feeling and strategy, and on how 'love' corresponds to 'relationality' (Butler, Boellstorff) and 'ordinariness' (Heaphy), but in non-Western geo-temporal contexts.

### As Queer as Old Folk: Troubling the Identification of 'Older LGB Adult'

Andrew D. King, University of Surrey | [andrew.king@surrey.ac.uk](mailto:andrew.king@surrey.ac.uk)

In recent years it has been recognised that the lives, experiences and issues faced by older lesbian, gay and bisexual (LGB) adults have not adequately been considered, resulting in a growing number of studies to shed light on this once marginalised and largely forgotten group of older adults. Whilst growth in this area is to be welcomed and indeed is drawn on in this paper, it nonetheless seems pertinent to pause and reflect on who is being addressed here and to begin to think more critically about the

identification "older LGB adult" in order to better understand the complexities that such categorisations occlude. Drawing on queer theory, ethnomethodology and conversation analysis and studies conducted by the author the paper asserts that we must think critically about the contingent nature of such identifications if we are to truly contest existing power relations, whilst seeking to incorporate difference.

### Confronting Normative Sexuality and the Pervasiveness of LGB and Childfree/Childless Ageing

Gerardo Zamora, (1) Universidad Publica de Navarra; (2) ETORBIZI | [g.zamora.monge@gmail.com](mailto:g.zamora.monge@gmail.com)

Ageing as a childless or childfree individual is an increasing phenomenon in Europe and many other societies; so is the visibilization of current LGBTQI\* older persons and their unique ageing process. Many contemporary LGBTQI older persons are childless or childfree and they have built an (sexual) identity that is largely intersected by their childfree/childless condition. Regardless of their sexual identity or sexual behaviour, ageing as a childless/childfree individual confronts the normative ageing process just as LGBTQI individuals do. By using in-depth interviews, this paper explores the discourses around intimacy, health and ageing from 12

childfree/childless LGB individuals aged +50 in Spain. It also analyses childless/childfree individuals in waves 1, 2 and 3 from SHARE (Survey of Health, Ageing and Retirement in Europe) and looks into their aspirations, caring for a partner or closed one, perceptions of being cared for by a partner or closed one, and engagement in social life. Being childless/childfree is as pervasive as sexual identity is, therefore understanding how these intersections work can contribute to better comprehend the ageing process, the diversity in old age and to build adequate policies for the growing share of LGB and childless/childfree older population groups.

## Revisiting Rubin: Later Life Sex and the 'Charmed Circle'

Rebecca L. Jones, The Open University | [rebecca.jones@open.ac.uk](mailto:rebecca.jones@open.ac.uk)

Rubin's (1984) concept of the charmed circle analysed the ways in which people mark off 'good, normal, natural, blessed sexuality' from 'bad, abnormal, unnatural, damned sexuality'. This paper revisits and rethinks the charmed circle through the lens of later life. It asks: if we start from (diversely positioned) older people's experiences, what does the charmed circle look like? Thinking about Rubin's charmed circle in terms of older people's sexuality reveals the extent to which it is premised on mid-life sexual experiences. For older people there are some significant inversions in which types of sex and sexuality are privileged and some noteworthy attempts to redraw the line between good and bad sex. While traditionally later life sex has been relegated to the 'outer limits', nowadays there are new pressures to remain sexually active as part of a wider project of 'successful' ageing.

For some older people, this may demand using 'unnatural' technologies such as drugs to improve erectile function or hormone replacements. In contrast to sex in mid-life, procreative sex by older people is generally framed as bad and unnatural, as can be seen in the anxieties around older mothers and post-menopausal child-bearing. When older people form new partnerships in later life, living 'in sin' may be treated as a morally preferred option to marriage. For some older people, contemplating sexual activity in later life may entail redefining what constitutes good sex or reasserting the undesirability of sex in later life. This paper draws on empirical data to discuss the ways in which the charmed circle is redrawn by and for differently positioned older people, in an attempt to decentre the sexual experiences of mid-life.

### Studying the Influences of Social and Conjugal Relationships on Attitudes toward Sexuality, Sexual Desire and Satisfaction.

Nadia Ammar, University of Geneva | [Nadia.Ammar@unige.ch](mailto:Nadia.Ammar@unige.ch)

Many studies on sexuality present the lack of sexual desire as an important cause of conjugal and sexual dissatisfaction or even health problems. However, most of them are based on samples of respondents who declare suffering from dysfunctional desire and they do not take into account attitudes toward sexuality. However, psycho-sociological studies dealing with attitudes toward sexuality emphasized that individuals do not give the same importance to sexuality. They demonstrate the influence of social

relationships on attitudes toward sexuality. A few studies have investigated the influence of conjugal interaction, while a few others have focused on the impact of how social networks contribute in shaping them. However, studies have seldom if ever convened those two approaches to understand attitudes toward sexuality, sexual desire and satisfaction. Based on data collected in 2011 of 600 participants living in Geneva (Switzerland), aged between 25 and 45 years old, this study demonstrates the importance of both conjugal and social

relationships on norms and attitudes toward sexuality. We hypothesize that attitudes toward sexuality is strongly associated to sexual desire and sexual satisfaction, and are constructed through interactions within the conjugal relationship, and framed by the social network. To understand the social and conjugal contexts in which individuals construct their

attitudes toward sexuality, this study will consider not only the different styles of conjugal interactions but also the social networks in a psycho-sociological perspective. This communication also discusses the methodology used to measure the conjugal and social relationships and its link to sexual variables.

## **Bringing the Intergenerational Perspective into Gay and Lesbian Lives. Exploring Practices of Love and Acceptance in the Families of Origin.**

**Chiara Bertone**, University of Eastern Piedmont | [chiara.bertone@unipmn.it](mailto:chiara.bertone@unipmn.it)

In Italy, where children remain economically dependent on their parents, and often continue to live together with them, well into their adulthood, gay men and lesbians tend to form personal communities from within rather than as an alternative to their families of origin. Therefore, intergenerational ties stand out as a necessary and central key to understand their lives, and social changes regarding homosexuality in this country. Based upon 80 interviews with parents and siblings of self-identified young gay men and lesbians, this paper explores notions and practices of unconditional love and acceptance developed within the families of origin. Therapeutic discourse emerges as a crucial cultural tool, although the ability to draw upon it to make

sense of family relations is not evenly distributed among social classes. The narrative of acceptance against which most of the interviewees measure themselves, and draw upon in orienting their practices, is centered on the notion of disclosure, building heavily upon a therapeutic vocabulary of intimate relations framing the family as a space for the development of authentic selves through real communication. The paper focuses in particular upon suffering as a crucial feature of this narrative, both in the framing of parents' path to acceptance in terms of a grieving process, and in positioning parents as those who can help the suffering homosexuals taking the route to a happier, heteronormative life.

## **The Biopolitical Sacrifice of Love - Vasectomy as a Ritual of Faithfulness in Partnerships**

**Isaac Gonzalez-Balletbó**, Open University of Catalonia | [igonzalezbal@uoc.edu](mailto:igonzalezbal@uoc.edu)

**Swen Seebach**, Open University of Catalonia | [swen.seebach@gmail.com](mailto:swen.seebach@gmail.com)

**Natàlia Cantó-Milà**, Open University of Catalonia | [ncantom@uoc.edu](mailto:ncantom@uoc.edu)

This presentation wants to explore how the necessity to renounce for that a partnership works has become transformed over the last century. Whilst before guaranteed by the transcendental ritual of faithfulness in marriage, current social transformations make these rituals increasingly obsolete. A variety of

new rituals of faithfulness have appeared much clearer and some of them much more directly related with sex and sexuality. One example is vasectomy as a love ritual. If to have offspring, to reproduce has become a major discourse justifying the search for and change in relationships, vasectomy is a willing cutting

of, a ritual in which the men try to signalise a readiness to renounce a "successful" (reproductive) partnership with other partners, to underline the exclusivity of the other. The

presentation will discuss the meaning of vasectomies as rituals of faithfulness in partnerships, looking at interviews with 30 men.

## Learning and Unlearning Future Childlessness: How Young Adult Lesbians and Gay Men Revisit their Visions of Intimate Life

Robert Pralat, University of Cambridge | [rp422@cam.ac.uk](mailto:rp422@cam.ac.uk)

Over the past decade, changes to the laws surrounding adoption and assisted reproduction have opened up new possibilities for same-sex couples and non-heterosexual individuals in Great Britain to pursue parenthood. A few years since the legislative advancements, it is of interest how LGBT people conceptualise their family life in these unprecedented circumstances. Now that the most substantial legal barriers to becoming a parent have been eliminated, do they see themselves as having children? This paper discusses some preliminary findings from an interview study of attitudes towards parenthood among lesbians and gay men aged 20-35 in Great Britain. In particular, it examines narratives of non-heterosexual individuals who entered their adulthood at a

time when being a lesbian mum or a gay dad was becoming increasingly legitimate: in public policy, political debates and popular media. Analysing the narratives of this young cohort of adults whose views about their prospective intimate life have changed since their adolescence, I explore how they approach the topic of parenthood in the context of their current and prospective same-sex relationships. I argue that many of these lesbians and gay men have found themselves in a somewhat uncomfortable situation: having accepted the fact that they would not have children while coming to terms with their sexuality, they are now encouraged to revisit their attitudes towards parenthood, which often remains elusive.

### Young People's Views of Sexual Orientation in Sex Education

David Evans, University of Sussex | [david.evans@sussex.ac.uk](mailto:david.evans@sussex.ac.uk)

Sexuality, and more specifically sexual orientation, is an intrinsic part of sex education. But at what point does sex education transcend the boundary of heteronormativity? In the latter half of the last 20th century, sex education in England has, controversially, been viewed as a necessary component of health education. However,

typically only insofar as biological and medical aspects were concerned. Sexual orientation for instance, found a place in the curriculum during the 70s, but fell out of favour in the late 80s when the government passed an amendment forbidding local authorities from promoting 'the teaching in any maintained school of the acceptability of homosexuality as

a pretended family relationship.' In 2002, this amendment was repealed, thus educators should have been relieved of the perceived burden placed upon them by this amendment, but it appears that this is not the case. In this research, I have begun to examine the impact that sexual orientation has on and within sex education from the consumers of the programme. Focus groups and interviews have been completed with 21 LGBT identified young

people, as well as a survey of nearly 300 young people who identified as a range of sexualities, aged 16-18 in south eastern England to ascertain current views on whether sexual orientation has found a place in the education system, with regards to sex education. Unfortunately it has been found that sex education still follows a medical and biological discourse and sexual orientation only warrants a passing thought infrequently.

## **'We're Strange. We're Monogamous': Sex and Commitment in the Narratives of Men Who Have Married Men - Betwixt and Between Discordant Discourses and Norm**

Robert J Stocker, City University, London | [robert.stocker.1@city.ac.uk](mailto:robert.stocker.1@city.ac.uk)

Eamonn McKeown, City University, London | [Eamonn.McKeown.1@city.ac.uk](mailto:Eamonn.McKeown.1@city.ac.uk)

Sally Hardy, City University, London | [Sally.Hardy.1@city.ac.uk](mailto:Sally.Hardy.1@city.ac.uk)

The sexual behaviour and relationship arrangements of male couples have been well documented in the sociological and health sciences literature. However, few studies have explored sex and commitment among men who have 'married' men (MWMM) in a legally sanctioned form (e.g. civil partnership). MWMM confront two sets of discordant discourses and norms. On one hand they are socialised, to varying degrees, in a gay subculture said to promote casual sex over monogamous relationships. Gay men are also part of mainstream culture where the meanings and practices of marriage, although fluid, operate at discursive and normative levels to endorse stable, permanent and monogamous relationships. Drawing on personal narratives elicited through qualitative interviews with 28 men in civil partnerships in the UK this paper explores how MWMM reflexively engage with and reconcile these discordant discourses and

norms into meaningful arrangements in their own lives. The majority reported monogamous relationships. Monogamy was more common among younger men, men in relationships of shorter duration, and men with minimal experience or engagement with gay sexual culture. Nine men reported arrangements that allowed for a degree of sexual non-exclusivity while also protecting their relationship, and partner, from emotional harm and sexual infection. Consistent with previous research this study finds that monogamy is not taken for granted but reflexively negotiated among male couples. Furthermore, the narratives of MWMM provide a more nuanced picture of assimilation and resistance than is presented in abstract academic and public debates which tend to suggest that same-sex couples who 'marry' uniformly acquiesce to emerging (homo)normativities.

## **“Unproductive” Families and their Discontents. Polish Struggles for the Same-Sex Civil Unions**

**Joanna Mizielińska**, Polish Academy of Sciences, Warsaw | [jmiziel@gmail.com](mailto:jmiziel@gmail.com)

On 25th of January 2013 for the first time in history, the Polish parliament debated three draft proposals regulating and legally recognising same-sex couples. The rejection of the proposals was hailed by the Western media as a proof of differences between post-communist Poland/Eastern Europe and Western Europe. However, the ‘Western eyes’ failed to notice the multiplicity of voices and stances. The hot debate revealed a complex picture of Polish social and political attitudes that cannot be seen as univocally pejorative or simply termed as “backwards” only. In my presentation I would like to focus on the wider social debates and show: (1) how the notion of heteronormative sexual citizenship based on ‘useful’ and ‘appropriate’ family forms is being produced and reproduced in the public sphere; (2) and how the heteronormative ideal is being

slowly undermined by the emerging and more visible, new LGBT narratives. Firstly, drawing on the recent debate and the findings from my projects on families of choice in Poland (current and already accomplished), I will outline public/political strategies of silencing and excluding/including certain types of intimacies.. Second, drawing on biographical interviews that I conducted, I will show how members of families of choice struggle for a recognition of their relationships in daily life. Important question for the discussion during the conference will be to consider what kind of new political agenda could emerge out of the personal experiences of LGBT families in Poland, that would go beyond the current political horizon of LGBT organizations (in Poland and elsewhere in Europe)?

## **Homosexuals (LG) and their Siblings in the Family**

**Inés Brock**, MAPP-Institut Magdeburg - Nebenstelle Halle(Saale) | [kontakt@ines-brock.de](mailto:kontakt@ines-brock.de)

Nowadays we have a more open atmosphere in society to accept same-sex partners. But we know almost nothing about their personal attitude towards their families and how the members of the family can also accept that way of living. The parents are often involved in a less supporting way because of their disappointment about the sexual development of their child. There is no qualitative research about their real involvement but all the studies insist that parents experience many difficulties in empowering their homosexual child. Surprisingly, there is a complete lack of information about parents who can face that challenge with a more supporting attitude. On the other hand, there is a horizontal position in the family, which is possibly more affected by such information. The earlier the coming out

is, the more the siblings are involved. In particular for younger brothers it can be assumed that they are losing the inner image of the older brother as an encouraging and shining model. We know something about the strong emotional bonds between siblings but nothing about their feelings towards an LG. The interest in the paper goes in that direction. By regarding the empirical findings about family outcomes after recognition of a gay son or a lesbian daughter, I will collect theoretical hypotheses about sibling outcomes. Could siblings be a source of power for the LGs? Positive and negative emotions are strongly connected in siblings’ relationships. The early affection is sometimes disturbed by rivalry and jealousy but in adolescence at the latest, the children support each other more than fight

against each other. How does the coming out of the homosexual orientation of one of the

siblings as a whole influence family life?

## 12RN23 - Theoretical and/or Methodological Critique and Change

Chair(s): Katrin Tiidenberg

### Can Sexuality Research Explain Social Change? Misunderstandings and Traps of an Approach to our Global Society

Vulca Fidolini, University of Strasbourg | [fidolini@unistra.fr](mailto:fidolini@unistra.fr)

The Mid-term conference of the ESA RN23 in London, in January 2013, gave us the opportunity to question our researches on sexuality. Two main questions arose about the approach I have been developing, both from a theoretical and a methodological point of view. First of all the question is: can we elevate sexual researches on contemporary societies to the level of one of the prime tools to interpret present social change? And then: which are the traps that create misunderstandings and misinterpretations if we do so? Through a re-analysis of some research findings concerning my present doctoral studies, I will try to propose a reflexion on these two questions in order to offer a first answer. Studying sexual behaviour and choices on a population of young men who arrived in Europe from Morocco, I tried to explore sexuality as a field of renegotiation of

their own culture in new social scenarios. Many topics became objet of discussion: from religious ethics to socialisation processes and family relationships. Sexual experiences, however, and the way they are described by these young adults, can become a narrative context to stage (mettre-en-scène) cultural belonging and rhetorical images of their own culture, to reinforce shared feelings or to satisfy the researcher's expectations. Distort representations of reality may arise. The purpose of this paper is to discuss these issues and to understand how it is possible to overcome this kind of methodological traps. The aim is to reach a level of analysis able to build a theoretical perspective which can be considered reliable to depict the condition of a particular social actor starting from his sexual behaviour and choices in the context of our global society.

### 'The Effect of Affect: Sexual Embodiment and the Disappearance of the Social'

Sue Scott, Edinburgh Sociology/ York Women's Studies | [sscott69@btinternet.com](mailto:sscott69@btinternet.com)

Stevi F Jackson, University of York | [stevi.jackson@york.ac.uk](mailto:stevi.jackson@york.ac.uk)

Affect' has long been used in social science as a synonym for the emotions and there is nothing new in treating emotions as embodied. However, as the term is being deployed in more recent theoretical contexts it has become associated with a form of biologism. Affect is defined, for example, as 'the stuff that goes on

beneath, beyond, even parallel to signification' (O'Sullivan 2001, in Hemmings 2006). In this paper we will explore the theoretical issues behind the development of 'Affect Theory' - the ways in which post-structuralist deconstruction has given way, in certain forms of cultural theory, to an idea of affect grounded

in a claimed common ontology between the humanities, social and natural sciences. We will argue that perspectives which previously posited bodily capacities and desires as potentially supra-social, as resistant to, and potentially subversive of social order have morphed into arguments for the significance of the pre-social in the context of embodiment. Using embodied sexual practice as an example, we will explore the way in which this

particular extra-cognitive form of theorizing effectively shifts theory away, not only from sociality in general, but also from embodied social experience. We will suggest that, while claiming to have political potential, the turn to affect offers little scope for the form of critique underpinning sociology's stance as a critical discipline capable of making sense of the actualities of social life.

## Affective Work and Social Reproduction in the Context of Relationship Counseling

Marjo K Kolehmainen, University of Lapland | [marjo.kolehmainen@ulapland.fi](mailto:marjo.kolehmainen@ulapland.fi)

The presentation continues the discussion on the relationship between the affective and the social. The 'affective turn' in the social sciences and humanities increasingly relocates critical attention from language, discourse and representations to matter, embodiment and non-linguistic systems of meaning making. In this vein, the presentation discusses the affective mediation and renewal of social categories and hierarchies. The presentation focuses especially on relationship counseling that can be seen as a part of therapy culture, characteristic of contemporary Western societies. The phenomenon is discussed especially in relation to the concept of affective work, paying attention to its normalizing and

normative implications. Examining this phenomenon offers insights into the ways gender and sexuality are constantly in the making. Hence, the presentation explores the ways on how sexual norms are constituted and lived as discursive, material and affective ways. In addition, as affects can be seen as embodied, unconscious and non-verbalized forms of experience and knowledge, the affective turn calls for new epistemological and methodological approaches. As the presentation is based on a research proposal and not on an ongoing study, the emphasis is mainly on theoretical and methodological issues. However, a few empirical examples are used to illustrate the key arguments.

## Women as an Embodiment of Honor

Ayşe Kalav, Akdeniz University | [aysekalav@gmail.com](mailto:aysekalav@gmail.com)

Oppressing control over women's body and sexuality prevails to be the case in Turkish society as it is often the case in the world. Domination continues to suppress women as it was before with various discourses on their sexuality which is regarded to be closely connected with honor. Their body is still considered to be something to be taken control of, changed, and had a right to talk on. Such various discourses remain intact and find their meanings in honor codes in patriarchy. The notion of *namus* which can at best be

translated as sexual honor into English-becomes clear when one looks at gender patterns constructed by the patriarchal system. The intention of the study is first to discover a link between gender and honor through interviews with people from different backgrounds. As the study asserts the claim that honor codes force men and women to experience and practice the notion in different ways, reaching the connection is of utmost importance. Further, the history of honor and the changes it has undergone are discussed in

this study. It aims to analyze on a socio-cultural basis why honor is defined the way it

is, particularly in regard to women.

## 15RN23 - Sexuality-Open

Chair(s): Chiara Bertone

### Music and Sexuality: Reggaeton Changes Mexican Teenagers' Sexual Representation and Behavior?

Dulce A. Martínez, Metropolitan Autonomous University, Mexico City | [aireeeh@gmail.com](mailto:aireeeh@gmail.com)

José Alberto Sánchez, Metropolitan Autonomous University, Mexico City | [yomultiple@gmail.com](mailto:yomultiple@gmail.com)

In 2005 in México appeared a genre of music called reggaeton and from that year the beginning of the reggaeton era in our Country started. This music became so popular that pretty soon teenagers started to set up a youth collectives called reggaetoneros that have a specific way of life and a specific urban culture, that includes a certain look, clothes, body art, religion, particular language and expressions that have influence in teenagers' sexual representation. The purpose of this paper is to

reflect and share information about the changes in Mexican teenagers about their social representations of sexuality and their social practices that nowadays are contribute to generate genre problems and to construct women and men roles supporting in reggaeton contents. Basically reggaeton music's contents spread violence against women and specific sexual roles that express by one hand, a dominant men image and by the other hand, a submissive and sexual objet women image.

### The Only Gay in the Village? Lesbians, Gay Men and Bisexuals Living in Rural Communities in Finnish Lapland

Hanna M. Peltomaa, University of Lapland | [hanna.peltomaa@ulapland.fi](mailto:hanna.peltomaa@ulapland.fi)

Gay men, lesbians and bisexuals are often assumed to be out of place in rural communities. The normative assumption is that rural areas are universally inhospitable to them, forcing them to flee to cities in order to come out, find a queer community, and become liberated; to "be themselves". This is also the case in Finland where the situation for lesbians, gay men and bisexuals living in rural environments is prevalently painted as "terrible", meaning that in order to live openly they are forced to move into cities or urban areas, thus becoming so called "sexual

refugees". Describing rural life as "terrible" says very little, practically nothing about the social dynamics of living in the countryside. There are obviously aspects which are not so pleasant, instead rather distracting. Based on interviews and ethnographic research with gay men, lesbians and bisexuals and other villagers living in the rural areas of Finnish Lapland, my paper will analyse and discuss the construction of the social life in the countryside. How do the norms in different places, occasions and with different people define the possibilities and restrictions of LGB

persons' lives, and why? Finnish Lapland is not only a sparsely populated area, there are also a range of ski resorts which during the winter season turn into temporary pseudo-towns, populated by tourists and season workers

mostly from the metropolitan area. These ski resorts differ greatly from the "regular villages" and offer local LGB persons a very different kind of venue for meeting others.

## From Professional to Public Discourse: How and When Homosexuality Became Part of the Imagined Social World?

Yuval P. Yonay, University of Haifa | [yyonay@soc.haifa.ac.il](mailto:yyonay@soc.haifa.ac.il)

Following the understanding that the homosexuality-heterosexuality binarism is relatively recent, new questions emerged: When did this cultural scheme become dominant? How did it spread from one social circle to another? How did it affect the lives of women and men involved in same-sex eroticism, love, and friendship? This paper adds to the expanding literature on these questions by exploring the unique case of the British-ruled Palestine and early Israel, a society where indigenous Arabs, Eastern European settlers, Arab-Jewish immigrants, German-Jewish refugees, and British colonialists lived side by side and, occasionally, fell in love and had sex with one another. The analysis is based on 2 main sources. First, on the basis of 30 in-depth interviews with Israeli Jewish gays born between 1924 and 1948 I

analyze the understanding and experiences of interviewees' early feelings of attraction to other men. Second, I used automated software to find all references to "homosexual", "lesbian," and their derivatives in two major dailies between 1948 and 1969. I found that the number of explicit references to these terms was negligible in the first decade (0-3 per year), and still very rare but already noticeable in the second decade (8-10 items per year). Based on the interviews and the newspaper analysis, it is argued that until the late 1950s, concepts of "homosexuality" and "heterosexuality" were not part of lay people's thinking. Yet by the mid-sixties the labels of "homosexual" and "Lesbian" have become part of the language recognized by both gays and straights. The implications of this development conclude this paper.

## The Mythical 40.000 – Discourses on Sex Work and Trafficking in South African Print Media

Carolyn Kueppers, Ludwig-Maximilians University, Munich | [Carolyn.Kueppers@soziologie.uni-muenchen.de](mailto:Carolyn.Kueppers@soziologie.uni-muenchen.de)

Ahead major sporting events, the media is often abuzz with articles on how sex work will increase during these events. It was especially striking that a specific number – 40.000 anticipated extra sex workers, who often became 40.000 trafficking victims – occurred in many articles before the last two World Cups, 2006 in Germany and 2010 in South Africa as well as before the Olympics 2004 in Greece and 2012 in London. Notwithstanding that none of

these forecasts came true, as actually a cutback in the demand for sexual services could be reported afterwards (Deutscher Frauenrat 2006; Richter 2010), these discourses had a decisive impact on the perception and representation of sex work. Mostly sex workers were either perceived as victims who had to be rescued, or perpetrators who should rather be deported. Several campaigns against trafficking were initiated in

each country, while coevally discussions came up, on how to protect the borders that were feared to be more permeable during the event. In my paper I am analysing some of the discourses on sex work and trafficking around major sporting events with the Soccer World Cup 2010 in South Africa as empirical example. In this context, I contemplate the World Cup

2010 as agent and promoter of discourses, as football with its references to 'real' masculinity and heteronormativity offers an intersectional field, in which the discourses on sex work and trafficking are part of the hegemonic construction of gender, sexuality, race, class and nationality.

## RN23 - Poster Session

### Sexuality in Contemporary Media: Nova Cosmopolitan and Cosmopolitan España Magazines.

Nayara Baiochi, Federal University of São Paulo | [nay\\_baiochi@yahoo.com.br](mailto:nay_baiochi@yahoo.com.br)

This paper analyzes the publications contained in the sector "Love and Sex" of Nova Cosmopolitan and Cosmopolitan España magazines' websites in order to understand the forms of intimate relationship, eroticism, seduction, desire and perceptions of body in contemporaneity. As the Brazilian version of the american magazine Cosmopolitan, Nova Cosmopolitan is a female journal which publications are characterized by specific features provided by the context of its production. Published for the first time in 1973, its website is about ten years and is formed by these sections: "Beauty and Health", "Love and Sex", "Famous", "Fashionable", "Life and Work", "Nova answers", "Blogs" and "Sexy thermometer". The Spanish version,

Cosmopolitan España, on the other hand, had its first publication in 1983. It is also a female magazine directed to women between 20 and 45 years old. Its website is divided into six different sessions: "Love and Sex", "Beauty and Health", "Fashionable", "Bodylove", "Men" and "Horoscope". From the systematic study of recent articles, images and readers' notes, we try to comprehend the interactions between media and contemporary sexual culture, giving priority to subjective aspects associated with the phenomenon through the identification of resemblance and disparity between the articles and theoretical production of Georg Simmel, Zigmunt Bauman, Sigmund Freud, Gilles Lipovetsky and Anthony Giddens.

### "And so I Search for my Lost Life. Where Did it Go?" – Sexuality, Abuse and Violence in Children's Homes 1950-1980. A New Political Discourse.

Andrea Christine Smioski, University of Vienna | [andrea.smioski@wisdom.at](mailto:andrea.smioski@wisdom.at)

Only in recent years it has become possible to address the crimes that have been committed in the name of education and welfare in state-run children's homes, taking custody of neglected children from deprived or lone-

mother families from 1950 until 1980. Sexual abuse, violent punishment and psychological degradation served as instruments of total education (Goffman). Contrary to the official purpose of Home education, people have been

weakened and broken for life. For the first time, former victims talk about their childhood in these homes now. They tell of imprisonment, censorship, prohibition of contact with their families, physical pain, sexual and sexualised violence, psychological injuries and death fears, coercion to hard labour, etc. Many lost self-esteem and confidence; they are still plagued by loneliness, depression and suicidal thoughts. Because their parents couldn't, professional educators should take over their education. But one out of two educators had no formal training. And academic and

professional staff? Lawyers and psychologists of the youth welfare service, psychiatrists, curative educators, judges, Home directors, social workers and care takers supplied the Homes with children, without seriously pursuing the rumours of violence. This paper presents the results of a biographical interview project, run from 2010 until 2012. The pact of silence about the violence in children's homes shall be broken. The unspoken urges the story. It is painful to hear, but there is no way around it.

## Elderly Subjects' Sexual Life Quality in Tunisia

Jamoussi Benkhalifa Raja, University of Sfax | [raja\\_isseps@yahoo.fr](mailto:raja_isseps@yahoo.fr)

Our prospective investigation has affected 41 married men and 31 married women with at least one partner in the couple who is aged 65 years and over. The study population is recruited on the occasion of a medical consultation in tow local clinics in a rural area of the Tunisian Center-East. More than half of the investigated subjects consider old age as the "best period of life ". The continuity of the sexual activity is reported by 78% of men against 74.2% of women. The time of the cessation of sexual activity in relation to the age of the husband shows two peaks: the first is in the age group 80 years and over in which

the correlation with age seems obvious. The second group 70 to 74 years in which the most common causes are male impotence generated by chronic illnesses and/or disabling conditions in men, or by the refusal (avoiding) in women who have marital conflicts underlined by authoritarian and dominant husbands. The reported causes of sexual dysfunction are erection problems 65.1 % followed by sexual desire disorders 39.6 %. These desire disorders are reported almost two times more often among women than among men.

## RN24 - Science and Technology

### 01RN24 - Communicating Science

Chair(s): - Katarina Prpic (Institute for Social Research, Zagreb - former)

#### Governance in the European Research Area: Science Communication and Citizen Participation

Lorna M Ryan, City University, London | [lorna.ryan.1@city.ac.uk](mailto:lorna.ryan.1@city.ac.uk)

This paper considers modes of science communication in the 'European Research Area'. The realization of the ERA is a key objective of EU research policy. The relationship between the governance arrangements in the ERA and the mode(s) of science communication is explored, with a particular focus on the nature of public engagement envisaged. The persistence of elements of the traditional 'deficit model' of science communication is identified within EU policy discourses and a conclusion of the paper

is that securing public support for funding decisions is a paramount aim of public engagement practices envisaged. Such an understanding contrasts with modes of science communication that promote the active engagement of citizens ('the public') and scientists in the science governance process. To illustrate these issues an overview of the newly introduced ERICs (European Research Infrastructure Consortium), key pillars of the European Research Area, is presented.

#### Who's Opening the "Ivory Tower"? Italian Scientists' Engagement in Society

Sergio Scamuzzi, University of Torino | [sergio.scamuzzi@unito.it](mailto:sergio.scamuzzi@unito.it)

Giuseppe Tipaldo, University of Torino | [giuseppe.tipaldo@unito.it](mailto:giuseppe.tipaldo@unito.it)

Renzo Carriero, University of Torino | [renzo.carriero@unito.it](mailto:renzo.carriero@unito.it)

The ivory tower of science has wide opened bridges with society nowadays. While most surveys in the STS field investigate the general lay public, we try to see "the other side of the moon" by studying the scientific community. Our work aims to uncover the variety of scientists' attitudes towards the challenge of the growing involvement of science with social issues, and to explore some sources of variations of such attitudes. This paper presents first evidence from an extensive survey on Italian university scholars (N=1900) in the field of hard sciences, medicine, engineering and architecture. Both pure and

applied scientists were interviewed and core issues explored, such as science communication activities, engagement with different publics, ethical issues in scientific practice. We selected four basic indicators to look for and into possible forms of integration between scientists and society: 1) scientists' perception of being trusted by the general public, 2) their propensity to interact with private firms, public institutions, ONGs as experts, 3) their recognition of non-experts as producers of valid knowledge (so-called "science 2.0"), 4) their representation of science when communicating to the general

public, i.e. science made of “shared truths” vs. science made of a “plurality of (conflicting) theories”. We then clustered scientists according to their level and forms of

integration in society, discovering who’s actually opening the “ivory tower” of science and who’s not in the Italian scientists community.

## Knowledge and Attitudes towards Energy in Time of Crisis

**Fabienne Crettaz von Roten**, University of Lausanne | [Fabienne.Crettazvonroten@unil.ch](mailto:Fabienne.Crettazvonroten@unil.ch)

Switzerland has a turbulent history with energy and nuclear energy in particular (i.e. many public demonstrations, popular initiatives on the subject, a ten-year moratorium accepted in 1990, etc). No people in Europe was called to the polls as often as the Swiss population in order to make decisions in the energy area. The popular initiative contribute to a culture of deliberative and discursive democracy in Switzerland; science has been the object of many initiatives that regularly leads to gain information and to debate on scientific issues. After the Fukushima accident, the Swiss Federal Council opted for withdrawal from nuclear energy in the horizon 2035. The issue of energy is part of a wider pattern of concerns about the climate change and the environment, and of critiques of excessive consumption. In

this context, we observe projects intended to stimulate energy saving, a move toward sustainable energy, introduction of environmental taxes based on polluter-pays principle, etc. These changes are not implemented without problems, in particular due to the economic crisis. How do these elements affect knowledge, attitudes and behaviours related to energy ? This presentation aims to answer those questions by examining a survey realised on energy in a big town of the French-speaking part of Switzerland in 2013. A multivariate analysis will document the influence of area level variables (for exemple, political geography on related votations, etc.) and of individual variables (gender, education, attitudes towards environment, etc).

## How and Why the Scientists Communicate with Society? The Case of Physics in Italy

**Selena Agnella**, University of Torino | [selena.agnella@unito.it](mailto:selena.agnella@unito.it)

**Andrea De Bortoli**, University of Torino | [andrea.debortoli@unito.it](mailto:andrea.debortoli@unito.it)

**Sveva Avveduto**, CNR Rome | [s.avveduto@irpps.cnr.it](mailto:s.avveduto@irpps.cnr.it)

**Sergio Scamuzzi**, University of Torino | [sergio.scamuzzi@unito.it](mailto:sergio.scamuzzi@unito.it)

**Loredana Cerbara**, CNR Rome | [loredana@ykko.com](mailto:loredana@ykko.com)

**Alba L'Astorina**, CNR Rome | [lastorina.a@irea.cnr.it](mailto:lastorina.a@irea.cnr.it)

**Adriana Valente**, CNR Rome | [adriana.valente@cnr.it](mailto:adriana.valente@cnr.it)

The paper presents the results of a recent extensive survey aimed at investigating attitudes, motivations, obstacles and practices in science communication in the Italian physics community. The community of scientists and researchers represents the target of the

survey, reversing the usual focus summarized in the “Public Engagement with Science and Technology” whereas previous survey were typically focused on lay public. Data have been obtained from Computer-Assisted Web survey submitted to the entire community of

physicists in Italian Universities and in the main Research Centers CNR (Consiglio Nazionale delle Ricerche), INFN (Istituto Nazionale di Fisica Nucleare), INAF (Istituto Nazionale di Astrofisica). In particular we have studied: the perception and representation researchers (physicists in this case) have of science, of different segments of their public and of their own role; their perceived ethics and social responsibility; their communication practices outside the restricted scientific community and the impact of generation and

gender on the entire process. The project provides new research evidence-based insights and formulates guidelines to improve the communication and social engagement of the scientific community. The study of the community of physicists is a pilot case and a more extensive research project to investigate a larger scientific community (i.e. not only physicists) and new phenomena like institutional dissemination, fund-raising, science communication in conflicts and decision making is currently being pursued.

## 02RN24 - Public and/or Private Research Sector

Chair(s): Harald Rohrer (Linköping University)

### The Industrial Chairs at Universities: A New Public-Private Sharing of Knowledge Production and Dissemination?

Sophie Nemoz, University of Versailles Saint-Quentin | [sophie.nemoz@uvsq.fr](mailto:sophie.nemoz@uvsq.fr)

The paper deals with a sociological research carried out on very specific projects of public-private sector interface between academic institutions and business actors, namely the implementation of industrial chairs at universities. It fundamentally questions the new modes of leadership and learning beyond the established dichotomy between non-profit and for-profit sciences. Their partnerships are under investigation in the context of European economic crisis. To what extent are they indicative of current reconfigurations of knowledge production and dissemination? Firstly, a review of scientific literature and experimentations will catch attention on the typology of stakeholders, arrangements, values as well as past and current critiques against the produced knowledge. This state of

art will shed light on the scope of industrial chairs, their institutional dynamics in European countries and their different impacts. Secondly, as a sociologist and an associate professor working in the international chair of the University of Versailles Saint-Quentin, I will share experience from my participatory observation of this case study. The intersecting views on a local experience and existing initiatives across European universities will throw light on the present advances and the future challenges of collective learning and sharing of knowledge between public science, corporate science and technology. Taking various points into consideration, we aim at discussing the spectrum of social organizations and their implications for both research and teaching activities.

## Six Ways of Saving the Future of Finland – On Epistemic Governance in Science-Industry -Relationships

Seppo Poutanen, University of Turku | [seppou@utu.fi](mailto:seppou@utu.fi)

Six Strategic Centres for Science, Technology and Innovation (SCSTIs) were launched in Finland in the years 2007 – 2009. SCSTIs are instruments of Finnish innovation policy, bringing industrial and academic partners into open limited companies with the shared purpose of accelerating innovation processes and renewing Finland's industrial clusters. Funding for SHOKs comes from both public sources and participating companies. Ministry of Employment and the Economy, the governmental steering body of SCSTIs, published an external evaluation report on SCSTIs in February 2013. The report is highly critical of functionality of these policy instruments so far, indicating problems in goal setting, cooperation of partners, quality of related scientific research and added economic value, for example. From sociological viewpoint, the trajectory of SCSTIs injects some

realism into well-known models of new knowledge production such as 'post-academic science', 'mode 2 knowledge' and 'triple-helix', which tend to get the air of smooth necessity or unproblematic ideal in research literature. Furthermore, the detailed conflicts and failures in SCSTIs present empirical problems of interpretation to such frameworks which put the development of knowledge production into a rather monolithic picture (e.g. 'academic capitalism', 'neo-liberalism'). This paper stems from post-Foucauldian studies of governmentality and specifically applies the concept of 'epistemic governance'. Epistemic governance encompasses the ways by which actors work on other actors' conceptions of realities. Our analysis focuses on the contested understandings that the SCSTI partners give to the meanings of 'collaborative science'.

## 'Multisited Ethnography': Laboratory and Enterprise. Problematics of Approaching the Articulation of Science and Market in the Economy of the Crisis

Sílvia S.A. Cardoso, University Institute of Lisbon | [silvia.mail@hotmail.com](mailto:silvia.mail@hotmail.com)

In order to understand how innovation and knowledge is being produced in the articulation of social needs, the market and fundamental research in Portugal in the context of the crisis, we have conducted a three months intensive team field work observation inside two associated laboratories and two enterprises. This papers seeks to share and to reflect upon the methodological strategy of intensive ethnographic observation of two institutional contexts – the laboratory and the enterprise: focusing in the 'technical-scientific and social life' of research projects (Kopytoff, 1999). As well as to raise some theoretical and methodological questions about the possibilities of constructing sociological knowledge based on the meaning of social

action being produced in the comparison of these contexts. The concept of multisited ethnography (Marcus, 1995) is being reshaped over the years: it's not about multiplying the points of observation of a social phenomenon but about relocate the terrain per se and about rethink the status of our very own problematic: to see it as our subject as well as a terrain, from which we can position and relocate our standing point of observation. As soon as socio-technical innovation networks (Callon, 1986) became our subjects and terrain as we focus in bringing to light the web of social relations that is woven between scientists and entrepreneurs we gained a thick perspective on how the production of innovation and knowledge is being (re)shaped by the personal

trajectories of actors and the networks they establish or disarrange despite or in account of

the crisis.

## Running a 'Research Business': Morality and Economics in Physician-Industry Research Collaborations

Sarah Wadmann, University of Copenhagen | [sala@sund.ku.dk](mailto:sala@sund.ku.dk)

Physician-industry relationships make up a morally contested domain. While collaborations between academic researchers and private companies are portrayed as strategic means of ensuring innovation and economic growth, physicians who engage in such collaborations risk seeing themselves pictured as corrupted or biased. Building on ethnographic fieldwork undertaken in the Danish healthcare system during 2009–2011, this paper explores how such conflicting political expectations interact with everyday practices in clinical hypertension research. The

findings indicate firstly that publicly employed physicians experience a need to form financial ties to pharmaceutical companies in order to feel independent and undertake the research they find important. Secondly, they suggest that physicians must undertake "moral work" to engage in industry collaborations, and that this "moral work" shapes the organization of public-private research production. The paper concludes that financial exchanges in physician-industry research collaborations cannot be understood separately from the moral agency they evoke.

## 03RN24 - Business Sector & Technological Challenges

Chair(s): Aaro Tupasela (University of Helsinki)

### (In-)Adaptability. How Business Sectors Cope with New Technological Challenges

Ulrich Dolata, Stuttgart University | [ulrich.dolata@sowi.uni-stuttgart.de](mailto:ulrich.dolata@sowi.uni-stuttgart.de)

The peculiarities of new technologies exert distinct pressures of change onto business sectors, their structures, institutions, and actors. However, the transformative capacity of new technologies leads neither directly nor deterministically to clear-cut organizational, structural, and institutional changes. The ways a sector perceives, adopts, and copes with new technological opportunities I refer to as adaptability. I distinguish between three variants of adaptability: 1. Inadaptability. Sectors and their established actors can be characterized by persistence and structural conservatism that hinder the ability to anticipate and adopt new technological

challenges and impede a timely and orderly process of transformation. From the perspective of the sector's core, uncontrolled and crisis-ridden change then occurs, frequently emerging either at the sector's periphery or from beyond. 2. Proactive adaptability. In contrast to the above inadaptability sectors are those sectors characterized by a structural, institutional, and organizational openness and flexibility which encourages the early perception and adoption of new technological opportunities. The core structures, institutions, and organizations quickly perceive and become receptive to new technological opportunities. 3. Power-based

adaptability. Existing power figurations can enable sectors and their established actors to block, contain or only partially adopt, for extended periods, the opportunities provided by radically new technologies. This results in a

process of only moderate restructuring that does not seriously challenge or disrupt the sector's existing sociotechnical match, institutional basis, or actor figurations.

## Innovating by Patents

René John, Institute for Social Innovation (ISInova), Berlin | [rene.john@isinova.org](mailto:rene.john@isinova.org)

Innovations allegedly stand for a progress by machine-technical artifacts acclaimed most of all by engineering sciences, economy, and politics. Following Schumpeter they are regarded as the means to persist on global markets. For this purpose markets are rearranged by momentous, economic applicable structural disturbances. However this is rather caused by displaying and confirming the unique characteristics than by factual originality or superiority. It happens increasingly by applying the least element for a patent as well as by arguing about such minor patents. Especially in the IT-sector patents become a preferred means to prevail products against competitive ones. The superiority promised by the attribute “innovative” is not only caused by the factual superiority of the product but appears as a result of adjudication,

though. Therefore Innovations are rather co-caused by patents than protected. The consequences are increasing patent-lawsuits as well as perceived and actual product piracy. While these consequences propel the legal protection of unique characteristics the patent system appears as a part of a process, which is boosted by innovation anyhow – the acceleration of socio-cultural change. Innovations are not the new and superior technical artifacts or participatory arrangements (the lately so-called social innovations). They are rather a matter of social processes to establish a structural variety and to sustain its innovative change-causing effects within a wide network of references. Innovations have to be observed as results of the attempt to manage the otherwise blind socio-cultural evolution.

## Doing Open Innovation through a Heterogeneous Networking

Michela Cozza, University of Trento | [michela.cozza@unitn.it](mailto:michela.cozza@unitn.it)

Recently, experts and policy makers have paid special attention to processes of technological innovation, highlighting how this phenomenon responds more to the logic of Open Innovation (OI), rather than being confined to the individual firm. The interest in Open Innovation models is the starting point of the research that I wish to discuss referring to main results. The project has been financed by Eidon Lab S.c.a.r.l. that is a nonprofit Italian independent Research Laboratory that experienced networking innovation since its foundation in 1978. I have been commissioned to study the openness of a small and heterogeneous group

of organizations and institutions to networking pursuing an Open Innovation model. Precisely, the sample encompassed twenty organizations and institutions situated in North-Italian regions, selected on the base of Eidon Lab's interest and belonging to different technologically dense environments. I have interviewed one R&D manager for each organization. Then, I have reworked the SWOT analysis in order to re-construct the interviewees' viewpoint on networking and OI. Precisely, in order to categorize the strengths and opportunities, I have applied the 4C© Model developed by Federico Butera

Irso~Butera and Partners (Butera 1999). Referring to weaknesses and threats, I have applied the Hansen and Birkinshaw's Innovation Value Chain model (2007). Beyond the specificity of the original mandate, the arising insights may be of scientific interest

because they are strictly connected in addressing the question of mediation and collaboration among an array of expert knowledge, technologies and organizational and professional memberships.

## How Croatian R&D Organizations Support their Researchers' Performance?

Katarina Prpic, Former: Institute for Social Research, Zagreb | [katarina@idi.hr](mailto:katarina@idi.hr)

Sociological theories of science are mainly focused on macro-determinants of scientific knowledge production, often at the international level, at the level of transnational scientific fields or the level of national science systems (Gibbons et al., 1997; Becher & Trowler, 2001; Whitley et al. 2010). In spite of a long but discontinuous tradition - from the classical studies of industrial science to contemporary organizational STS and innovation studies (Hemlin et al., 2008; Fagerberg & Verspagen, 2009) - the social studies of corporate science have been neglected (Penders et al., 2009). Such neglect in Croatian case has primarily resulted from a deterioration of the transitional economy and consequently its R&D activity. With the aim to explore the organizational factors of

researchers' performance in business sector, an empirical online (web) study was carried out in 2012 on a sample of the 245 Croatian researchers mostly from the registered R&D organizations/units. Data on respondents' social and professional profile, published and other innovative output were collected by a questionnaire. Researchers' perceptions of organizational support to innovation were also examined by the use of questionnaire (OSIQ) developed by Pirola-Merlo (2000). Since OSIQ was earlier applied to a sample of the whole Croatian research population, a comparison between the public science and business sector can indicate in which sector the organizational factors are more supportive for researchers' innovative performance.

## 04RN24 - Bio-Medical Issues

Chair(s): Ulrich Dolata (Stuttgart University)

### Patients, Business and the State – Sustainable Use of Intangible Assets in Biomedical Research

Aaro M Tupasela, University of Helsinki | [aaro.tupasela@helsinki.fi](mailto:aaro.tupasela@helsinki.fi)

The use of biobanks, genetic databases and patient healthcare records has become an important tool in biomedical research. Given the significance that commercialization has in relation to the production of scientific knowledge and its role in economic

development, it is important to recognize the connection between these reservoirs of human information and new innovations. To date, however, commercial development and the successful utilization of these resources (biobanks, genetic databases and patient

health care records) have been limited due to a number of obstacles relating to the ethical and legal basis for their use. To some degree this can be explained by the lack of successful business models that take into account the challenging governance regimes and ethical problems which surround public information resources, but it can also be explained by broader societal concerns regarding the impact that such ventures will have on medical and health care practices, as well as the challenges of translational medicine. The presentation will examine research results

based on the sustainable use of intangible assets in biomedical research. The role of critical elements within the patient-business-state axis that play a role in the sustainability of value creation regimes that can be deployed by public research institutes or private companies will be examined. In addition the presentation will explore the implications that various patient engagement strategies have for the creation and deployment of intangible assets and value creation within various national innovation systems.

## **Building Science Capacity for Cancer Research at São Paulo, Brazil: Negotiating Scientific Knowledge for Public Health**

**Renan Gonçalves Leonel da Silva**, State University of Campinas UNICAMP | [leonnelrg@gmail.com](mailto:leonnelrg@gmail.com)

**Maria Conceição da Costa**, State University of Campinas UNICAMP | [dacosta@ige.unicamp.br](mailto:dacosta@ige.unicamp.br)

Negotiation of Science policy at development countries is complex and has the relationship between actors as a critical aspect for set policy agendas. On the field of life sciences, the biomedical knowledge production and public health demands are two related social process. Thus priorities from public health shape research agendas for scientific knowledge production and it translate into new therapies and treatments. Important question is how biomedical research agendas is setting by public health demands, and what's the role of scientific community to establish and change science policy? The objective here is to present the main actors and support research instruments for Cancer research in São Paulo State, Brazil. The emphasis is the relations between actors for producing a new scientific

agenda about Molecular Oncology in some important institutions of research on the city of São Paulo, mainly after 1980s. Using the interdisciplinary approach of Social Studies of Science and Technology, this work intends collaborate to comprehension of how emerging new scientific capacities on biomedicine – and why this is culturally and situated process. We search for information in official reports on national and state institutions of research funding, as well applying interviews with important researchers. The conjuncture of research agenda setting has an important meaning, since it represents how politics influence the production of scientific knowledge and public debates and social narratives.

## Biobank Participation in the Contexts of Health Care and the Welfare State: Case of Finnish Patients and Citizens

Heta Tarkkala, University of Helsinki | [heta.tarkkala@helsinki.fi](mailto:heta.tarkkala@helsinki.fi)

On the European level there is declining interest to participate in biomedical research. This is also partly true in the case of Finland. But the Finnish experiences and data suggests that Finns are still mostly positive towards participating in research. In general it is known that in northern welfare societies people tend to have positive and supporting attitudes towards medical research and biobanking. The reciprocity people understand being part of the publicly organized research and health care sector is at the heart of it. The aim of this paper is to analyse in detail what meanings both patients and citizens as potential participators in biobanks give to welfare state, health care and donation. Based on the interviews and group-discussions with patients and lay people, the donation is associated in either case as part of welfare state activities, its

public health care system and research institutions. Interestingly the potential patient participants and lay people are framing their possible participation conceptually resembling manner. Several studies have suggested, that people tend to participate in medical research, clinical trials and biobanks based on their previous knowledge and trust in the institution. This is an interesting notion as it also underlines the importance of the social setting, institutions, experts – the actual overall situation. The expectation of reciprocity and the ethos of universalism make the potential participation strongly bound to the social context. In this paper a more detailed understanding of the local ethos of welfare state reciprocities and its role supporting science will be presented.

## The Mirror of Controversy: Biomedicalization and Hybridization of the Hyperactivity in Poland

Michał Wróblewski, Nicolaus Copernicus University, Toruń | [mich.wrob@gmail.com](mailto:mich.wrob@gmail.com)

The social objectivization of ADHD (Attention Deficit Hyperactivity Disorder) combines many of the characteristic features of the biomedicalization. For these reason, Science and Technology Studies can be used for analyzing this phenomenon. The definition of the disease, both on the etiologic, diagnostic, and therapeutic level, is influenced by the latest achievements in the field of genetics and neurophysiology. According to the naturalistic definition, the ADHD is a biological disease and transmitted hereditarily. Furthermore, the ADHD has a hybridical nature - the naturalistic definition affects official legislation, social self-identification, the operations of non-governmental organizations. At the same time

ADHD is entangled in controversy. The naturalistic definition opponents show the problematic status of the evidence that ADHD is a biological disease. They also indicate the harmful potential of pharmacological treatment and excessive expansion of diagnostic categories. For some time now ADHD become one the main issue in polish social discourse focused on the children's health. As it turns out most of the publication does not take into account the explanations alternative to naturalistic definition. I will be interested in the dynamics of representation of discourse centered around ADHD both on the scientific level (Polish research on etiology of the disease), and within the social community

(Polish popular publications on the disease). I will also focus on the process of hybridization of ADHD, showing how many levels of social practice is being transform during the

expansion of the naturalistic definition in the polish context (especially in the changes in legislation).

## 05RN24 - Academic Careers

Chair(s): - Harald Rohrer (Linköping University)

### Increasing Competition within Academic Fields and Individual Career Paths – A Comparison of the University Systems of the United States, Germany and France

Stephanie Beyer, University of Bamberg | [stephanie.beyer@uni-bamberg.de](mailto:stephanie.beyer@uni-bamberg.de)

Nilgun Massih-Tehrani, Otto-Friedrich University Bamberg | [nilgun.tehrani@uni-bamberg.de](mailto:nilgun.tehrani@uni-bamberg.de)

The US-American system of higher education takes on a leading role in international science and research, which is also reflected in the fact that American universities dominate international rankings. Seen as a role model, US-American universities offer orientations for current reforms in Europe, specifically in Germany with the "Excellence Initiative" and in France with the "Initiative d'Excellence". German and French politicians seek to increase the international visibility of their own universities to compete with excellent American research institutions. At the same time, both countries implemented to some extent New Public Management reforms due to budget shortcuts. In times of economic crisis it is likely that the European higher education systems develop towards a higher level of competition as is the case in the US, since it allows financing only a small number of very

prestigious universities. Research has indicated that the level of prestige of US-universities plays a crucial role for academic career opportunities of PhD candidates. Therefore our aim is to find out if individual career patterns in Germany and France are also influenced by competitions among universities. Based on Pierre Bourdieu's field theory we (1) construct three academic fields using multiple correspondence analysis (MCA) on the basis of publication rates, amount of third party funding, prestige and ranking positions of universities. This allows us to capture the prevailing national structures of the German, French and US academic fields. Within each of these fields we then (2) analyse data on individual careers with event history analysis taken from CVs of professors in order to identify relevant factors of career paths.

### Mapping Careers of Doctoral Recipients

Inge van der Weijden, Leiden University | [i.c.m.van.der.weijden@cwts.leidenuniv.nl](mailto:i.c.m.van.der.weijden@cwts.leidenuniv.nl)

In the Netherlands, empirical knowledge about the employment status, career path development and career choices of doctoral graduates is limited. From 1990 to 2010 the number of thesis defenses in the Netherlands

almost doubled from 1898 to 3736. At the same time the career opportunities in Dutch academia are insecure, with many temporary contracts and few available positions once PhD holders advance on the career ladder. In 2008

and 2009 an exploratory study was conducted to provide an overview of the initial employment outcomes of recent PhD recipients in the Netherlands (n = 565). 86% of doctoral recipients in this survey were employed at the moment of the defense. 63% of all respondents were employed in academia, of which 51% in the Netherlands and 12% abroad. Most graduates have a temporary position. The majority (66%) of the doctoral recipients are primarily concerned with research in their jobs. In our presented study

of 2013 the same respondents will be asked to participate in a follow-up survey, in which they will be asked about their career choices and the added value of a PhD in their careers. By reporting the career development of PhD holders who finished their PhD four to five years ago, this research will contribute to increase our knowledge of career paths of PhD holders, their considerations regarding their careers and the value of the PhD on the current labour market.

## Re-Searching Career in Italian Universities

Manuela Negro, University of Torino | [m.negro@unito.it](mailto:m.negro@unito.it)

Scientific institutions have changed over time, in interdependence with social, political and economic transitions. Also Universities have to adapt to these transitions, even more within the current financial and economic global crisis. The aim of this paper is to analyze how Italian Universities have changed so far, looking at the academic workforce and scientists' professional careers. As the specificity of academic careers' paths in different scientific fields mirrors the general research system's transformation, it is necessary to look at them in order to plan profitable long-term policies, at a national and international level. Data, from a survey addressed to a representative sample of 5900 scientists working in each Italian University in Natural, Agricultural and Medical Sciences,

show that scientists careers are getting more fragmented, non-linear and uncertain, without opening up to virtuous processes of internationalization and mobility among research organizations. However, there are differences in careers paths in relation to the third mission spread in specific scientific fields, but also signs of change inside some scientific careers related to different degrees of internationalization, private investment attraction, autonomy and flexibility. The internal organizational heterogeneity and the external relation to the social and economic environment have an impact both on sustainability of higher education institutions and the development of a knowledge-based economy.

## Professional Advancement of a Young Scientist in the Innovation Society (the Russian Case)

Nadia Asheulova, The Russian Academy of Sciences | [simar@bk.ru](mailto:simar@bk.ru)

Svetlana Dushina, The Russian Academy of Sciences | [sadushina@yandex.ru](mailto:sadushina@yandex.ru)

Interest in the problem of an academic career is connected with two principal circumstances: first, institutional transformation of science and education in the post-Soviet time; second, new forms of knowledge production caused by

the link "science – business – government". Actors in this chain are students, academics, engineers, businessmen, government officials. The aim of this study is to find out how professional advancement of young scientists

in an innovation economy is built. It will be shown that a traditional techno-scientific pattern (basic research – applied research – development – introduction – production – market) has changed significantly in the new economy, and how the qualities of human capital has also changed. The differences in human capital in two types of economies are presented in the form of oppositions: stability/mobility, continuity/discreteness, age-linked accumulation of (academic) merits/ risk, administration resource/ individual abilities. These features of new knowledge production have implications for professional careers of

young scientists. The authors polled 50 young researchers of the Russian Academy of sciences by way of questionnaires and interviews. Based on the data interpretation, the key positions for a successful professional promotion are presented: an inventive team, a research project, a respectable pay, trans-mobility. It has been found that an academic career abroad has still remained attractive both for young researchers. The paper examines features of a professional growth in the context of Russia's academic environment where the government is the primary actor, and the role of business is insignificant.

### **In Times of Crisis, Science Falls Mute. Norbert Elias on Social Engagement and Accountability of Sciences**

Marta Bucholc, University of Warsaw | [bucholcm@is.uw.edu.pl](mailto:bucholcm@is.uw.edu.pl)

In the debates on the place of science in current crises a following concern seems to prevail: What can science do to remedy the crisis? This point of view does not take into account an issue of the impact of crisis on science and its debilitating effects on science's capability to offer remedies. The reflection on science in crisis typically covers the well known problems of reductions in research funding and the related difficulties in maintaining high scientific output with decreasing assets. However, apart from this financial and institutional side there is also an ethos to scientific project, the core of which is what Norbert Elias referred to as "detachment". This ethos is also threatened by crisis. It is not the first time that social surrounding calls upon science to come up with answers to

unanswerable questions. However, if the demand is pressing and the atmosphere filled with anxiety, anger and overwhelming sense of urgency, which seldom favors profound insights, the result is that science turns away from its ethos and focuses on catering for social needs with the same level of emotional involvement which is shown by those demanding it to act, engage itself, take positions and come to aid. As a result, science loses the quality of relatively higher detachment which was the reason why it was addressed for help in the first place. I propose to discuss this process based on Norbert Elias's view on accountability in science and impact of crisis mentality on intellectual activity.

## Ghetto Laboratories: Cultural Diversity in the Life Science World

Izabela Wagner, University of Warsaw | [wagneri@is.uw.edu.pl](mailto:wagneri@is.uw.edu.pl)

This paper analyzes the impact of scientists' culture of origin on their work and careers. The particular focus here is on the phenomenon called by insiders "ghetto - lab" - the scientific teams, which are composed of scientists of similar origin who work mainly in important American institutions of research. Based on ethnographical studies conducted in life-science research laboratories in France, Poland and the US, I show that the creation of such almost uni-ethnic research-teams constitutes a spontaneous adaptation to the dynamics of the researchers world, a way to participate in the process of

internationalization of the scientific world, and the response of participants to the dynamic expectations of their professional environment. From the perspective of the sociology of labour, this process of bringing together people educated in the similar geographic (cultural) areas renders their work easier and more efficient in terms of the organizational structure as well as relationship among team-members. I show how those adjustments are implemented and what kind of beneficial or negative influence they could have on the work of researchers.

## Scenarios for the Development of Russian Science: The Case of the Siberian Akademgorodok

Anatoly M. Ablazhey, Novosibirsk State University | [ablazhey@academ.org](mailto:ablazhey@academ.org)

Organized a half century ago in Siberia – Novosibirsk's Akademgorodok was created as a scientific structure of a new type, which comprehensively address the tasks of research, training for science and the application of scientific achievements in the economy. P. Josephson even called it the "New Atlantis". Akademgorodok became a successful attempt to implement the idea of creating a new type of scientific center in the Soviet Union. The main task of the paper - to show what transformations experienced Akademgorodok in the last 20 years, the difficulties and problems arise in the relationship between basic (non-profit or public) and for-profit science, the role now

played by Novosibirsk University. Today, there are heated debates about who should determine the future of Siberian science city: academic leadership, municipal authority or the business community. The analysis will be conducted in the context of Russia's science policy, where priority is given to the development of university research through the organization of federal (Krasnoyarsk) and national research universities (Novosibirsk, Tomsk, Irkutsk) and the creation of centers for commercialization of scientific developments. The result of the analysis will be the possible scenarios of the Siberian science city in the near future.

## From Silence to Evidence Based-Activism: Epistemic and Political Empowerment the Portuguese Stuttering Association

Daniel N Costa, University of Coimbra | [danielneves@ces.uc.pt](mailto:danielneves@ces.uc.pt)

Science and Technology Studies have shown the virtues of moving from Public Understanding of Science to Public Engagement with Science. Experiences of collaborative participatory research and community-based participatory research reveal some of the complexities related to both science/society relations and science/democracy relations. These are characterized by the engagement of academic actors and civil society organizations in the resolution of problems of common interest and in the development of innovative projects with social impact through the promotion of egalitarian and nonhierarchical epistemic relationships between them. This paper aims to put forward some reflections resulting from the collaboration between the Centre for Social Studies and the Portuguese Stuttering

Association. The collaboration seeks to promote strong dialogues between people who stutter, speech language therapists, psychologists, experts in neuroscience, linguistics, among others, in order to foster a reflection on stuttering, its causes, possible coping strategies and different legal and clinical frameworks. The purpose of this paper is to reflect on the potentiality of this collaborative device to promote the epistemological empowerment of people who stutter, allowing their emergence as "experts in experience" and owners of relevant knowledge about stuttering, giving them the legitimacy to participate in the collaboration, not as objects of research, but as active subjects of knowledge production, capable of developing an evidence-based activism.

### The Network Organization of International Academic Ties: Comparing Neocolonial, World-System and World-Society Models

Maria Safonova, National Research University Higher School of Economics | [msafonova@eu.spb.ru](mailto:msafonova@eu.spb.ru)

The paper explores factors responsible for strength of various forms of academic ties between countries. It begins with examining several theoretical models of international academic collaboration: "the republic of letters", "academic (neo)colonialism", "the classical world-system", and "the world-society". Propositions about factors affecting intensity of ties between countries and

configuration of their overall network are then derived from each of the models. These propositions are then tested against empirical data on two kinds of academic ties: volumes of international student flows between pairs of countries (UNESCO statistics) and number of co-authored papers (Web of Science database). Negative binomial regression is used to estimate influence of various independent

variables (funding of science, distance, historical experience of dependency) about the significance of which the models make different predictions. We discover that expectations associated with “the classical world-system” fit the data best, with “academic neo-colonialist” factors also important in the case of international student

flows. To account for possible differences between disciplines and to capture the directions of evolution of the overall system, we then explore changes in international collaboration network in two fields: geoscience and economics during a 30-year period (1980-2010).

## Science or Economy: How Economically Oriented is the Scientific Practice in Germanys Publicly Funded Research Organisations?

Anna Schleisiek, Karlsruhe Institute of Technology (KIT) | [anna.schleisiek@kit.edu](mailto:anna.schleisiek@kit.edu)

In times of crisis, publicly funded scientific organisations are expected to provide innovations for economic growth. Especially organisations and researchers in the engineering sciences, such as materials research, are expected to meet these expectations. Moreover in recent years, research governance in European countries has been transformed, leading to a more market oriented research governance. An approach to characterise this transformation is the term “Economisation” (Ökonomisierung) of science, describing it as a process of adoption or enhancement of economic principles of action into the scientific field (Schimank 2008). Is such a field still autonomous? According to Pierre Bourdieu (1998) the autonomy of a scientific field lies in the ability of the fields actors to break or form constraints or demands from other social fields and stay true

to their own characteristics such as unselfishness, gratuitousness' and to strive for recognition amongst colleagues. Do research teams follow economic or scientific principles in their day-to-day practice? How do they affect the knowledge production in these groups? What organisational settings facilitate or hinder their introduction? I will address these questions by reporting empirical findings from my phd-project using methods of qualitative social research in a case study focussing on research teams in the field of advanced materials research in Germanys publicly funded research organisations. Bourdieu, P., 1998: Vom Gebrauch der Wissenschaft. Konstanz Schimank, U., 2008: Ökonomisierung der Hochschulen - eine Makro-Meso-Mikro-Perspektive. Pages 622-635 in: Rehberg, K.-S. [Ed.]: Die Natur der Gesellschaft. Frankfurt/Main

## Mapping Scientific Production in Portuguese Higher Education Institutions

Teresa Carvalho, University of Aveiro | [teresa.carvalho@ua.pt](mailto:teresa.carvalho@ua.pt)

Sónia Cardoso, CIPES and A3ES | [scardoso@ua.pt](mailto:scardoso@ua.pt)

Framed by knowledge society and New Public Management (NPM)/managerialism, attempts have been made to promote changes in research policies and knowledge production aiming to strengthen the link between this production and economy. Public policies are developed to put forward new modes of

knowledge production, focused on interdisciplinary, applied and commercially-oriented research. Within knowledge production, NPM/managerialism ideas are set to promote accountability and control, reflected in complex assessment exercises. Based mainly in the counting of the number of

publications and citations in international peer review journals, these exercises determine researchers' decisions on the diffusion of their work. This paper aims to analyse how Portuguese higher education institutions researchers diffuse their work and the potential effects this may have on knowledge production. It resorts to the publications identified by researchers as being the most relevant ones within the study cycles' accreditations promoted by the Portuguese Agency for the Assessment and Accreditation of Higher Education. Findings allow concluding that knowledge tends to be diffused through

papers in international journals and conference proceedings. However, some differences emerge between researchers' scientific areas, academic qualifications, academic rank and gender. International publications tend to be more common among Science and Technology scientific areas, researchers holding higher academic qualifications (e.g. PhD), from the middle ranks of the academic career and male researchers. This seems to evidence that Portuguese researchers do not a homogeneous perspective on knowledge production.

## **Evolving Institutional Environments and Coordination Modes in Research: Public Research Organizations in Mexico**

**Rollin Kent**, Autonomous University of Puebla | [kent.rollin@gmail.com](mailto:kent.rollin@gmail.com)

**Alma Carrasco**, Autonomous University of Puebla | [almacarrascoa@gmail.com](mailto:almacarrascoa@gmail.com)

In the context of scientific growth in middle income countries, the question arises: is there a worldwide convergence of national science systems or differing national pathways? To address this problem, it is useful to examine the recent evolution of the science system in Mexico, which has not only expanded significantly but has also diversified institutionally. In a wider research project on institutional change in Mexican public science, we have identified four institutional pathways in a rapidly evolving environment of modes of coordination: public universities, public research organizations, national health institutes and national government laboratories. This presentation will focus on one organizational sector, PROs. It will describe (1) the evolving institutional environment and coordination modes for scientific activity in Mexico over the past 30

years and (2) the specific traits of PROs and their institutional development in comparison to university science. Conceptually, the paper will bring together theoretical strands from institutional sociology and institutional economics . It expects to make contributions to: empirical knowledge about public science in a middle income country such as Mexico and the conceptual discussion of institutional change in science systems. ### Sustainable Bioenergy: UK State-Industry Arrangements Driving Innovation Priorities

Les Levidow, Open University | [L.Levidow@open.ac.uk](mailto:L.Levidow@open.ac.uk)

Within its overall policy on transition to a low-carbon economy, the UK government has given 'sustainable bioenergy' an important role. Given the future limits of sustainably sourced biomass, UK policy seeks to broaden the range of biomass convertible to energy in cost-effective ways. Technoscientific innovation has been advocated and funded for this aim. More so than other European countries, the UK government is dependent on large companies for bringing energy R&D to the commercial stage. Support measures for bioenergy innovation have been steered through specific arrangements between state bodies and industry. Scientists' R&D proposals advocate specific technological pathways as means to fulfil various policy aims and to attract private-sector sponsors; such co-funding has been an advantage or even a requirement for gaining Research Council grants. Through the Energy

Technologies Institute, scale-up projects depend on agreement among several multinational companies sharing financial risks and benefits. The UK strategy anticipates a national competitive advantage, yet UK research institutes and companies have been competing against each other for arrangements with overseas partners. Resulting from those agency-drivers, UK innovation priorities favour bioenergy mainly as input-substitutes within centralised large-scale infrastructures, especially current ones. Such priorities reinforce high-carbon, energy-intensive infrastructure such as electricity-only production and the internal combustion engine dependent on liquid fuel. This marginalises other bioenergy pathways offering greater environmental benefits, such as hydrogen fuel cells and biomass-CHP.

### Infrastructures in Crisis: Policy Learning and Emerging Socio-Technical Configurations in Off-Grid Solar Electricity Supply in India

Harald Rohracher, Linköping University | [harald.rohracher@liu.se](mailto:harald.rohracher@liu.se)

Despite the ongoing economic crisis we still think of the techno-structures of our society, such as energy, transport or communication, as mature and stable systems and of technology and innovation policies as a means to overcome this crisis. This perspective shifts if we look to countries such as India where infrastructures do not provide such a stabilizing force and are even a burden to further economic development. In my presentation I want to look at the crisis of the Indian electricity system, particularly in rural

areas. Interestingly many innovation policy conflicts and tensions centre on similar issues than those resurfacing in the current European crisis: the role of the public and private S&T sector, decentralization/regionalisation and (participatory) governance strategies. I will discuss these issues with the example of solar electricity supply in remote Indian villages. These socio-technical systems are embedded in wider cultural and institutional contexts and are a policy strategy to mitigate the crisis in the energy sector. Emphasis is put on the

different socio-technical configurations characteristic for these cases and the learning processes which can be observed to date at different levels: in organizing the implementation process, in developing institutional support structures as well as in operating and using these technologies. As India is currently embarking on a large-scale

programme for the implementation of solar technologies, I ask which kind of lessons can be drawn from such a socio-technical analysis for policies aiming at an increased use of solar technologies in remote rural areas and how this reflects different types of strategies to overcome crises in infrastructure systems.

## **Transitions in Biofuel Systems and the Quest for Social Sustainability: Results of a Delphi Study**

Barbara E Ribeiro, University of Salamanca | [barbaraesteves@usal.es](mailto:barbaraesteves@usal.es)

Alternative sources to fossil fuels are a priority in energy policy, an attractive option for markets, and often a target of public scrutiny. Biofuels are not a novel source of energy, but the brisk development of a global socio-technical system of liquid biofuels in the last decade has called the attention to what became one of the most controversial alternatives to oil so far. Fostered by political and economic support worldwide, biofuels technologies have been changing in a fast pace to address issues of efficiency and sustainability. However, while technological development is responsible for societal benefits, it also brings along detrimental consequences, affecting especially more vulnerable groups. In this work, ethanol is taken as a case-study to identify potential social impacts of an intended transition

between first and second-generation technologies through an expert consultation using the Delphi method. Experts are asked to indicate and analyse main issues that are likely to play a part in the social sustainability of second-generation ethanol (cellulosic ethanol), in the future. For that, the study builds on previous research in which a social matrix for the impact assessment of ethanol was designed and adopts a lifecycle approach where two different technological pathways are compared, highlighting implicated actors. While mitigation of major social threats such as food insecurity may be regarded as an advantage due to the use of non-edible crops as feedstock in the production of cellulosic ethanol, other potential benefits of a transition between ethanol generations are less clear.

## **Between Change and Stability: Towards a Radical Understanding of the Development of British Marine Energy**

Marios Kampouris, University of Edinburgh | [mkstorm84@yahoo.gr](mailto:mkstorm84@yahoo.gr)

The policies that will put an end to the current crisis largely depend on technological development which, to be successful, requires both the application of established practical knowledge and a series of innovations. Social scientists could improve their understanding of it via a critique which juxtaposes P. Bourdieu's habitus and C. Castoriadis' radical imaginary

with the phenomenon of technological innovation. Even though these concepts are considered suitable for understanding established practices (the former) and ex-nihilo qualitative changes (the latter), the habitus fails to provide a sufficient understanding of practical behaviour if we analyse the immense number of petite

innovations that one has to perform every day to adjust to the equally small but still existing changes to her environment. At the same time, Castoriadis' distinction between determinism and ex-nihilo coming-into-existence via the radical imaginary does not sufficiently explain the orientation of innovations. Based on this critique, I will present an innovative ontology which understands humans as constantly innovating beings, whose innovative action is orientated through a perspective. The latter is formed via the learning experiences of each

human agent which can be uncovered using a methodology of qualitative interviews. The paper explores the implications of the application of this methodology to the sector of British marine energy industry and reveals the experiences that shaped the perspective of engineers and businessmen who innovate therein. Finally the paper examines the distorting effects that impede the development of marine energy technology as described by the people of the sector,

## **b07RN24 - Energy & Waste Disposal II**

### **R&D on Renewable Energies: Between Science, Society and Economic Application**

Ana Delicado, University of Lisbon | [ana.delicado@ics.ul.pt](mailto:ana.delicado@ics.ul.pt)

Mónica Truninger, University of Lisbon | [monica.truninger@ics.ul.pt](mailto:monica.truninger@ics.ul.pt)

Ana Horta, University of Lisbon | [ana.horta@ics.ul.pt](mailto:ana.horta@ics.ul.pt)

Luis Silva, CRIA, Lisbon | [luis.silva98@gmail.com](mailto:luis.silva98@gmail.com)

Luís Junqueira, University of Lisbon | [luis.junqueira@ics.ul.pt](mailto:luis.junqueira@ics.ul.pt)

The development of more efficient ways of generating, storing and distributing energy from renewable sources has become a research priority in recent years. The dual threat of climate change and fossil fuel insecurity has generated a social demand for knowledge creation in this particular area. Funding agencies and research centres have been meeting this challenge, but this is an issue where the involvement of private companies is indispensable, in order to turn scientific discoveries into innovative products and processes operating in 'the real world'. At the same time, the scientists' role in public engagement with renewable energies is essential so as to allay controversies and resistance to new technologies. This presentation aims to discuss these issues, by focusing on the case of renewable energy

research in Portugal and the connections and interactions between researchers, private companies and civil society. It draws on both the overall field of renewable energy research and the particular case of the photovoltaic power station in the south of the country, which spun the creation of a technological park with a photovoltaic certification laboratory. It is based on documentary analysis and interviews with researchers, business representatives and other actors (e.g. environmental NGOs, local residents). This paper is integrated in a research project on science and society studies, intituled 'Socio-technical consensus and controversies about renewable energies', funded by the Portuguese Foundation for Science and Technology (PTDC/CS-ECS/118877/2010).

## Radioactive Waste: Final Disposal or Prolonged Storage?

**Jantine Schröder**, University of Antwerp (UA) / Belgian Nuclear Research Centre (SCK-CEN) | [jantine.schroder@ua.ac.be](mailto:jantine.schroder@ua.ac.be)

High level radioactive waste remains hazardous for very, very long time periods (100 000s of years). How can and should we deal with such a complex socio-technical problem? Today, deep geological disposal is considered by many in the field as the best management option, to be implemented as soon as possible. This approach ultimately aims to be both final and passive: after filling, the disposal will be permanently closed and sealed. This strategy is backed up by a diverse socio-technical argumentation, assuming that geological stability is greater than socio-political stability and that the burden to future generations should be limited. The anti-programme to this programme of 'closure' would be one that focusses on 'openness'. In light of the long term hazard, such a programme would challenge the divorce between surface and subsurface and underline uncertainty and a

need for flexibility. In this presentation we will explore if and how this hypothetical programme and anti-programme are reflected throughout the Belgian and the Dutch radioactive waste management policies. The Belgian implementer wants to implement geological disposal, which is legally defined as "without the intention to retrieve", as soon as possible. The Dutch radioactive waste management policy prescribes long-term interim storage for at least 100 years. Eventually deep geological disposal is foreseen, but the waste needs to remain retrievable. Throughout this contribution we will illustrate how these seemingly divergent programmes came into being over time, and investigate their variance by examining the socio-technical argumentations that underpin them.

## From a Novice to the Trendsetter in Final Disposal of Spent Nuclear Fuel - The Case Study of Technology Transfer from Sweden to Finland

**Matti Kojo**, University of Tampere | [matti.kojo@uta.fi](mailto:matti.kojo@uta.fi)

The objective of this empirically focused paper is to analyse the technology transfer of the Swedish nuclear waste disposal concept (called KBS) to Finland by the power company Teollisuuden Voima (TVO) and later by the nuclear waste management company Posiva. The research questions are as follows: How different factors (e.g. international development and economy) framed the Finnish nuclear waste policy and TVO's nuclear waste management and technology transfer of the nuclear waste disposal concept? Why and how the final disposal concept was modified in Finland? It is argued in the paper that already in the early days TVO adopted a pragmatic and cost-conscious policy regarding nuclear waste management. As the TVO was a novice in

nuclear waste management in the 1970s and still in the 1980s, the company consciously started to collect information and experiences from abroad. The pragmatic operation mode was supported by the Finnish nuclear waste management system and thus a very positive attitude to international cooperation and follow-up of foreign R&D dominated the work. Furthermore, Finland and Sweden are partly sharing the same geology, crystalline rock type. Currently final disposal management in Finland is seen as a world-leading solution. Thus, due to successful technology transfer the novice has become the trendsetter. Main data of the paper consists of the published research reports such as the safety analysis and the reports on updating technical plans for

the encapsulation and final disposal.

## Expert and Lay Constructions of Repository Monitoring in the Geological Disposal of Radioactive Waste

Peter Simmons, University of East Anglia | [p.simmons@uea.ac.uk](mailto:p.simmons@uea.ac.uk)

Anne Bergmans, University of Antwerp | [anne.bergmans@ua.ac.be](mailto:anne.bergmans@ua.ac.be)

Mark Elam, University of Gothenburg | [mark.elam@sociology.gu.se](mailto:mark.elam@sociology.gu.se)

Göran Sundqvist, University of Oslo | [goran.sundqvist@tik.uio.no](mailto:goran.sundqvist@tik.uio.no)

International programs to develop a solution to the problem of high-level radioactive waste have largely converged on geological disposal. As these efforts move closer to licensing and implementation, increasing attention is being given to the apparently technical challenges of developing strategies and specific technologies for repository monitoring. In this paper we examine the different meanings associated with repository monitoring by citizens from affected communities. The paper draws upon the work of a European research project: Monitoring Developments for Safe Repository Operation and Staged Closure (MoDeRn). It analyses workshops conducted in three countries - Belgium, Sweden and the United Kingdom - with citizens living in affected

communities and during a stakeholder visit to research facilities in Switzerland. What we find in these discussions are societal demands-in-the-making of repository monitoring. We explore the results from each country and trace the socio-technical combinations that emerge from them. The paper considers the tensions between citizens' constructions of monitoring - and of associated roles and responsibilities - and those of the expert community. The paper concludes by reflecting on the implications of these nascent demands for current efforts to achieve the passivation of higher activity radioactive wastes and the pacification of social conflicts around radioactive waste disposal.

## a08RN24 - Knowledge Production & Construction I

Chair(s): Fabienne Crettaz von Roten (University of Lausanne)

### Precaution and the Social Dynamics of Scientific Uncertainty

Oliver Todt, University of the Balearic Islands | [oliver.todt@uib.es](mailto:oliver.todt@uib.es)

José Luis Luján, University of the Balearic Islands | [JL.Lujan@uib.es](mailto:JL.Lujan@uib.es)

Juan Bautista Bengoetxea, University of the Balearic Islands | [Juanbautista.Bengoetxea@uib.cat](mailto:Juanbautista.Bengoetxea@uib.cat)

The precautionary principle has been adopted in recent years in a wide variety of science and technology related pieces of legislation, policy processes, as well as international treaties. It

is a key element in the current regulation of a number of (sometimes controversial) scientific-technological activities and products, but also an important topic in public discourse

and debate on science and technology. It usually is stated as a demand for the protection of health and the environment in the absence of conclusive scientific evidence about the relationship between causes and effects. In this, it is a regulatory decision making approach different from classical risk assessment and management. So far there is no general agreement on its interpretation and scope, nor the specific conditions of its application to policy making. Here we propose a typology of three clearly differentiated interpretations of the precautionary principle, each with its associated philosophical and policy implications. We found that these

different interpretations of precaution are the direct consequence of variations in the understanding of scientific uncertainty, as well as of the ways of assessing possible (but uncertain) impacts of scientific-technological development. There is a direct link to the question of what scientific knowledge is and what role it plays in (regulatory) decision making. The proposed typology permits a conceptual systematization of the current controversies related to the precautionary principle, while facilitating understanding of some of the deeper roots of science and technology policy debates.

## **Contested Futures of Science and Knowledge Production. Scientific Research between Conflicting Trends and Drivers: Collaboration & Competition, Scientific Excellence & Societal Relevance, Open Science & Commodification of Research...**

Petra Schaper-Rinkel, AIT Austrian Institute of Technology GmbH | [petra.schaper-rinkel@ait.ac.at](mailto:petra.schaper-rinkel@ait.ac.at)

This paper examines some of the main trends and changes that are likely to affect science and knowledge production over the next decades. We first analyse main dimensions of change where developments take place which affect the dynamics of science. We then explore the tensions and paradoxes that arise during the ongoing transformation of scientific research as researchers and research organizations try to meet very different and sometimes conflicting objectives. Current research practices generate new kinds of data (e.g. participatory sensing) and research involves more and more actors as everyone is producing digital data everywhere that can be used for research (e.g. using mobile phone data for urban planning). The traditional scope of stakeholders is expanding to include citizens, patients and volunteers in conservation issues as well as a range of

providers of online-platforms and research related services. Tensions are likely to arise between strategies to promote open access on the one hand and the significant market power of the main publishers and their databases used by science policy to measure the output of research and to determine funding on the other hand. The potential of research digitalization to impact science is huge; by changing research practices, changing ways of communicating and publishing research results and by challenging institutions and regulatory regimes that are established within national or transnational boundaries. Based on the results of the EU project "Research and Innovation Futures 2030: From explorative to transformative scenarios", the paper examines the main dimensions of change, its implications, and the tensions arising.

## Doing Research in Times of Crisis

Jessica Pflüger, FAU Erlangen-Nürnberg | [jessica.pflueger@fau.de](mailto:jessica.pflueger@fau.de)

As the ESA accentuates, the present crisis is multi-faceted. Not only do we witness financial and political crises, there is also evidence that universities are at a turning point – towards so called ‘entrepreneurial universities’ (Clark 1998). This ‘crisis’ is usually analysed with focus on the meso or macro level, e.g. the institutions of higher education or governance. In contrast, research practice is not a highly researched topic. However, especially in times of change it seems to be important to understand how ‘doing science’ works, which

calls for a micro perspective. Based on documentary analysis and interviews with scientists in Great Britain this presentation describes how qualitative research (especially case study research) is being done. It discusses how those practices are changing in times of national research evaluation. Some confirmation can be found of what is known in Sociology of Science as ‘economisation of science’. However, and more importantly, the interviews suggest a process of ‘standardisation of research practice’.

## Knowledge and Information Networks in the Python Community - How the Community Constructs Knowledge

Kamila Stepniowska, University of Warsaw | [k.stepniowska@is.uw.edu.pl](mailto:k.stepniowska@is.uw.edu.pl)

In the 21st century knowledge construction is no longer the sole domain of universities. The process of knowledge creation is wider than ever and includes not only universities and science companies, but also a new form of networks, like Wikipedia, or Github - a social network for programmers and programming code repository. Globalisation and availability of the Internet helped form communities around programming languages - knowledge and information networks. Programmers do not only use a language, and consume it by writing programs, but also create new solutions and programming knowledge. In this presentation I will talk about my research project which is an attempt to show social and cultural aspects of Python language development. I will try to reconstruct the knowledge and information network in the Python programmer community. The central

issue of my research is the process of knowledge construction and innovation. I assume it is connected with the phenomena of the weak ties in the community. The second issue I will present is the role of the open source movement in the growth of Python language and community. I chose Python because it is one of the oldest programming languages created outside of universities and private companies. A huge international community has formed around Python, connected both online and offline. Multiple international events are held each year (PyCon, EuroPython, DjangoCon), and there is a number of local meetings (eg. PyWaw). The wider reflection about the social mechanism which emerge from that phenomena can be useful in thinking about the present knowledge creation and distribution.

### The Institutionalization of New Narrow Specialities

Salahaddin S. Khalilov, East-West Research Center | [ssx@dazun.baku.az](mailto:ssx@dazun.baku.az)

The comparison of the cognitive structure of the global scientific community with the social structure of academic research institutions is of prime importance. Since the system of the Academy of Arts and Sciences and the appropriate network of scientific research institutions are still preserved in the most of post-Soviet countries, it is necessary to consider these institutions in the context of differentiation and the narrow specialization of scientific fields and to compare them with the structure of international communities. The question here is that these scientific institutions still preserve the Soviet traditions of structuralisation and classification, to which it is difficult to add new specialities. The institutionalization of new narrow specialities could be carried out only at the leading

scientific research organizations, which have enough staff and financial resources as well as mobile creative atmosphere which is capable of quick reorganization. It is not a coincidence that the structure of international communities basically coincides with the disciplinary structure of these leading scientific centres. However, the numerous scientific research institutions of the rest regions cannot respond to the changes that happen, and for this reason they are transformed with some delay. For this very reason, the structures of scientific research institutions of CIS countries are not always adequate to those of international communities. We assume that the gradual elimination of these differences in the course of the globalization process will give a new impulse to the development of global science.

### «Private Knowledge» and «Disciplinary Program» in Social Sciences : The Correspondence of R.K.Merton as a Case Study

Michel Dubois, CNRS - French National Research Center, Paris | [mdubois@msh-paris.fr](mailto:mdubois@msh-paris.fr)

This communication proposes to reinvest the sociological concept of "scientific discipline" through the study of the role of "disciplinary entrepreneur" played by Robert K. Merton. It is based on an original material : the Merton Archives (AM) available at the Rare Book and Manuscript Library (RBML - Columbia University) and particularly its correspondence. Sociology of science attaches considerable importance to what Merton describes as "the gap between private and public knowledge" (Merton, 1990, p.356). Scientists in their publications do not intend to communicate publicly about their private experience of scientific research. What can we learn from

this correspondance about the formation and conduct of the Mertonian disciplinary program ? The first part of the communication proposes to establish a brief state of knowledge on scientific disciplines. It will provide an opportunity to characterize the logic of individual and collective action in the conduct of a disciplinary program. The second part of the communication presents the material - a corpus of about 450 letters from the archives of the RBML - the sociological status of this material, the methodology and some of the basic characteristics of the corpus. Finally, the third part of communication applies the analytical framework define in the first part

on the material presented in the second part. The study of Merton's correspondence is intended to clarify the nature of the "gap" between the public and private dimensions of

his activity. We make the hypothesis that our material identifies how the conduct of a disciplinary program integrates a social logic specific to the academic world.

## Multidisciplinary Research and Hierarchies between Academic Disciplines: A Study of Nanomedicine in France and in California

S  verine Louvel, University of Grenoble | [severine.louvel@iepg.fr](mailto:severine.louvel@iepg.fr)

Academic research is getting more and more multidisciplinary. However, many social scientists agree that research practices are still primarily structured around academic disciplines. These studies give a detailed account of the cognitive role of academic disciplines in today's multidisciplinary research practices, and tend to present multidisciplinary projects as a reciprocal need for collaboration which is exempt from any conflict or power issues. In this paper, we would like to question this perspective on multidisciplinary by analyzing together the cognitive, organizational and institutional issues brought by multidisciplinary projects. Drawing on the comparative study of

nanomedicine in France and in California -a multidisciplinary field at the interface between engineering and the life-sciences-, our aim is to question the relationships between disciplines involved in multidisciplinary projects. We argue that this collaboration establishes a hierarchy: at the level of research practices, engineering-type approaches are considered as essential to renew biological research; at the professional and institutional levels, engineering disciplines also get more recognition and resources. This hierarchy forms as a result of the various objectives scientists and policymakers assign to multidisciplinary.

## The Social Construction of Attention Spaces in a Peripheral Sociology

Mikhail Sokolov, European University, St. Petersburg | [msokolov@eu.spb.ru](mailto:msokolov@eu.spb.ru)

This paper applies Goffman's ethnography of communication to analysis of "attention spaces" (R.Collins) of Russian sociologists. Conversation is our fundamental metaphor for academic communication. As Goffman and conversation analysts demonstrated, maintaining common attention focus in everyday talk is a remarkable achievement, rather than natural occurrence. It becomes even more complicated when – as in academic communication – the conversationalists are separated with space, time, and language barriers. Still, one of the fundamental academic imperatives is keeping pace with the development of one's research specialty; failing to demonstrate familiarity with relevant innovations is regarded as loss of intellectual

face. This paper uses 5-year participant observation, some 50 informal interviews with Russian sociologists, several surveys, and citation database covering 5 principal Russian sociology journals for a 15-year period to account for the ways awareness of others' sociological work emerge. Attention space is a result of application of search algorithms on communication infrastructure filled with content (periodicals, conference, Internet). The algorithms are largely shaped by normative rules arising from understanding of attention distribution as revelation of moral character. The rules are enforced by various policing agents (dissertation advisers, editors and reviewers, critics), as well as resources and interests the searchers have. An attempt to

typify these rules is made. In Russia, as in, arguably, other academically peripheral countries, we find emergence of two principal

opposite sets of such rules, “provincial” and “indigenous”, differing in their preference for native or English-speaking communication,

## 09RN24 - Research Profession & Practices

Chair(s): Nadia Asheulova (Institute for the History of Science and Technology, RAS, St. Petersburg)

### Subjective Trajectories of Women’s Scientific Excellence and Success in Physics and Chemistry in Estonia and Lithuania

Aurelija Novelskaite, Lithuanian Social Research Center | [aurelija.novelskaite@khf.vu.lt](mailto:aurelija.novelskaite@khf.vu.lt)

Kairi Talves, University of Tartu | [kairi.talves@ut.ee](mailto:kairi.talves@ut.ee)

Anu Laas, Tartu University | [Anu.Laas@ut.ee](mailto:Anu.Laas@ut.ee)

The paper is aimed to contribute to existent discussion of “excellence” and “success” in science in relation to gender. Concretely, considering low women’s involvement in exact and technological sciences and focussing on the issue in two post-soviet societies (Estonia and Lithuania), we explore coherence between women-physicists’ and women-chemists’ definitions of scientist’s excellence/success and their personal behaviour; the bond is perceived as both reflection of institutional discourses and foundation of women’s contribution to/achievement in science. Striving to reveal peculiarities of the issue in terms of differences/similarities between the Estonian and Lithuanian women-scientists’ narrations and in comparison with findings from other studies, qualitative analysis of 34 semi-structured interviews stands as an empirical background of this paper. The interviews with women-scientists were

accomplished in Estonian and Lithuanian in 2008 under FW6 project BASNET and here are used as secondary data. Working with national materials (and exchanging with verbatim translations in English for purposes of validity and reliability check), qualitative analysis was accomplished employing grounded theory approach suggested by Strauss and Corbin (1990). Initial findings provide trivial paradigmatic model: Having /particular personal properties /scientist /in particular environment and/ in general surrounding /accomplishes particular activities which /lead to signs of recognition. But substance of the model fluctuates depending on object (excellent (male) scientist vs. (female) interviewee) of the narration. This depicts prevailing gender order in the explored areas and suggests implications for other countries/fields.

## "It Has to Do with DNA": How the Head of Portuguese Research Units Envisage Scientific Mobility in a Context of Crisis

Emília R. Araújo, University of Minho | [era@ics.uminho.pt](mailto:era@ics.uminho.pt)

Sofia Bento, Technical University of Lisbon | [sbento@iseg.utl.pt](mailto:sbento@iseg.utl.pt)

The mobility of scientists has been widely promoted in the current period of crisis (this period of crisis). Several policy instruments have been put in action towards the facilitation of scientific knowledge production and dissemination. A growing number of studies has shown the advantages as well as the positive impacts of mobility both as regards career development and research centers excellence. Several results have been interested in deepen our understanding of the variables that may explain mobility as well as its impacts on national systems of science and individual careers. However, there are no studies showing what are the actual practices developed by research units as regards scientists mobility. Added to this, few studies

have explained which responsibilities the head of research units have on the profiles as well as on the impacts of mobility. This communication focuses on the head of research units discourses and representations aiming at discerning three key points: how they (heads of research units) define mobility; the importance they attribute to it; the degree of autonomy they say they have to strategically manage mobility; and, finally, the impacts they can identify in mobility. These results allows us to assume leadership as a key element when analyzing science and technology particularly in a context featured by economical crises and scarcity of jobs in science and technology developed in research units and universities.

## St Petersburg Researchers in the Mirror of the Science Grants Statistics

Elena Ivanova, Russian Academy of Sciences | [ea.ivanova@spbrc.nw.ru](mailto:ea.ivanova@spbrc.nw.ru)

The method that can be used in the sociology of science is analysing of science grants statistics. Russian Foundation for Basic Research (RFBR) began its work in 1993. The goal of the present study is to assess the degree and tempo of using the new way of research funding by scientists from various scientific disciplines and the different institutional science sectors. A few methodological principles were used in the present study. RFBR holds various types of selection competitions. A database on the grants received by St Petersburg scientists for their unsolicited research projects was collected by the author for this study (more than sex thousand grants). To avoid a double counting, those projects were selected into the database for each year that received funding

for the first time in the given year, and the continuing projects were not considered. Between one and ten people can take part in a research. But this information is lacking in open sources, so the correct number of principal investigators only can be calculated. Analysis of RFBR grants allows us to draw conclusions about the number of St Petersburg-based scientists who are the most active in the basic research. We can also infer from the above in which institutions and in which institutional sectors the basic research was done in various sciences in St Petersburg. Those researchers who were the RFBR's main grantees in 1993 to 2007 managed to adapt to this new mechanism of research funding in the first four to five working years of this foundation.

## Practices and images of research communication by Italian scientists over the past five years

Sveva Avveduto, CNR Rome | [s.avveduto@irpps.cnr.it](mailto:s.avveduto@irpps.cnr.it)

Loredana Cerbara, CNR Rome | [loredana@ykko.com](mailto:loredana@ykko.com)

Alba L'Astorina, CNR Rome | [lastorina.a@irea.cnr.it](mailto:lastorina.a@irea.cnr.it)

Adriana Valente, CNR Rome | [adriana.valente@cnr.it](mailto:adriana.valente@cnr.it)

The modern debate over Public Understanding of Science goes back to the early 1990s. Over the years we experienced numerous changes in our understandings of the publics, of science communication and scientists. These changes speed up over the past few years, in parallel to the urgent economic crisis we experienced. Although publics are traditional focus of PUS scholars, over the past few years a growing number of scholars have been focusing on scientists as main subject of investigation. As CNR-IRPPS we run a total of four studies (two of which within the Italian Scientists multi-technique Auditing and Analysis on science Communication research program) focusing, in different ways, on scientists' understanding and practices of science communication to the publics. Reflecting on the key continuities and discontinuities that characterize our findings,

we will explore some characteristics of scientists' communication activities and views. In times of crisis like ours, the role that science and technology can play in the future of our societies and the recovery from the crisis clearly depends from its relationship with society. It is therefore to our best interest to reflect on the main practices of science communication, limits and strengths. Our analysis indicates that scientists communicate science through a multiplicity of ways. We suggest that the latter cannot be enclosed in fixed models of science communication circulated amongst academics (deficit/dialogue model), and on the contrary include a variety of activities, opinions and forms of communication. All these formats can play a role in the future of science communication.

## 10RN24 - Science & Society

Chair(s): Katarina Prpic (Institute for Social Research, Zagreb - former)

### The Role of Science in Society: Resetting the Agenda with Web 2.0 Tools

Anna Shirokanova, Belarusian State University, Minsk | [shirokanova@bsu.by](mailto:shirokanova@bsu.by)

European politicians use the label of "knowledge societies" instrumentally, as a guaranteed win to their programmes. This often hides a neopositivist logic behind, holding that investment in science should by itself bring relief to social and economic problems. When this does not happen, science is blamed for being "not productive enough". However, this view of science as a panacea/scapegoat is

largely constructed outside of science and it does not take into account recent social theory. Cooperation logic (Fuchs) and the tactics of "weak" public (de Certeau) can help revive the image of science in society. The Internet provides a growing milieu for direct exchange between scientists and the public, via such web 2.0 services as blogs and social media that nourish scientific communication and scientific

communities. Under conditions of shrinking public funding, web tools can provide means for intensive regional networking and closer interaction with the public and business. Citizens act as an interested party in their own right, willing to contribute to science (e.g. via social computing) and to have their own voice. Using blogs gives scientists a higher visibility necessary for cooperation. Social media

enhance and coordinate regional communities and can affect the discourse on scientific policy (e.g. the all-European NET4SOCIETY letter on funding in Horizon 2020). In sum, the instrumental use of science in politics requires a revised image of science in society. A way to do this is to use web 2.0 tools that enable wider contact with the public and smoother cooperation within scientific community.

## The Europeanisation of Higher Education: A Challenge for Etatist Systems?

**Vincent Gengnagel**, Otto-Friedrich University Bamberg / DFG funded Research Unit "Horizontal Europeanization" | [Vincent.Gengnagel@uni-bamberg.de](mailto:Vincent.Gengnagel@uni-bamberg.de)

**Nilgun Massih-Tehrani**, Otto-Friedrich University Bamberg | [nilgun.tehrani@uni-bamberg.de](mailto:nilgun.tehrani@uni-bamberg.de)

**Christian Baier**, Otto-Friedrich University Bamberg / DFG funded Research Unit "Horizontal Europeanization" | [christian.baier@uni-bamberg.de](mailto:christian.baier@uni-bamberg.de)

Although transnational cooperation are common practices in science, European researchers largely depend on national governments and science policies, with European influences gaining momentum. Since the 1980s the EU seeks to foster cooperation in science and tries to overcome national disparities. In particular, the EU Framework Programmes (FP) are used to establish a European Research Area, according to the goals of the Lisbon Strategy (2000): to support scientific research and technological development in order to increase the global competitiveness of Europe as a knowledge-based economy. Hence, an emphasis is put on applied science. Our data on the 7th FP shows that the reactions of researchers and research institutions towards the EU's FP vary significantly: 'etatist higher education systems' – like France and Germany – participate to a

lesser extent, while Scandinavian countries as well as the Netherlands and the United Kingdom show high rates of participation. We argue that reactions to European FPs vary due to the relation between state and universities in the respective national academic fields. Particularly French and German researchers are embedded in strong national institutions and thus are oriented towards national 'instances of consecration' (Bourdieu). Thus, we conclude, further analysis has to focus on such institutions on both national and European level. An emerging new agent of consecration is the European Research Council (ERC). We present data from an ongoing project investigating the social composition of the ERC, providing further insights into the particularities of European research policies and the societal role of academic knowledge production and evaluation in Europe.

## Uses of Information Technology in Community Development

**Claire Wallace**, University of Aberdeen | [claire.wallace@abdn.ac.uk](mailto:claire.wallace@abdn.ac.uk)

**Kathryn Vincent**, University of Aberdeen | [K.L.Vincent@abdn.ac.uk](mailto:K.L.Vincent@abdn.ac.uk)

The study is about the impact of information technology on rural communities and forms part of the dot.rural programme at the University of Aberdeen. This part of the programme considers how broadband access affects community cohesion and well-being using qualitative approaches. The study suggests that people are connected in different

ways to information technology, with clear divisions between young and old, middle and working classes as well as between digital natives and digital immigrants or those excluded altogether. The use of technology in community development depends upon the presence of “social entrepreneurs” who are effectively able to mobilise civil society.

#### Sticky Tactics? Repertoire Diffusion and Activist Traditions in anti-GMO Direct Action in Britain, Belgium and France

Graeme Hayes, Aston University | [g.a.hayes@aston.ac.uk](mailto:g.a.hayes@aston.ac.uk)

Tracing repertoire diffusion is notoriously difficult, especially at the micro-level. This paper offers a way forward by examining like-for-like cases across three jurisdictions, examining the diffusion of a specific model of direct action through the construction of a European actor network. It problematises the conditions of transferability of supposedly 'modular' repertoires (Tarrow 1998) across national boundaries, even where these are contiguous. I compare three examples of direct action against GM crops, cultivated in agricultural research centres in France (vines, Colmar, 15 August 2010), Belgium (potatoes, Wetteren, 29 May 2011) and the UK (wheat, Rothamsted, 27 May 2012). In each case, activists explicitly constructed their action on the 'French model' of accountable, public, open 'civic disobedience'. Yet whereas in France activists were able to destroy the GM trial 'non-

violently', in Belgium the action was characterised by physical confrontations between activists and police, and in the UK the action was abandoned at the last moment in the face of legal sanction and police mobilisation, following an effective public campaign by biotech scientists. The direct comparability of the actions (target, method) enables us to isolate the contextual factors that structure outcomes, and make tactics 'sticky'. I argue that this 'stickiness' is produced by a combination of external and internal movement factors, including counter-mobilisation, police adaptation and legal toolkits, movement life cycles, and, especially, the importance of 'activist traditions', or the development of movement praxis within culturally-constituted understandings of action, which in turn shape and constrain the possibilities of action.

#### Laboratories of Democracy: The Role of Protest Camps in Social Movement Organization

Fabian Frenzel, University of Leicester | [ff48@le.ac.uk](mailto:ff48@le.ac.uk)

Patrick McCurdy, University of Ottawa | [pmccurdy@uOttawa.ca](mailto:pmccurdy@uOttawa.ca)

Anna Feigenbaum, University of Bournemouth | [afeigenbaum@bournemouth.ac.uk](mailto:afeigenbaum@bournemouth.ac.uk)

Protest camps are an organizational form of protest which have occurred across social movements with increasing frequency over the last 30 years. In this rich, varied, transnational

and interconnected history, protest camps have developed, adapted, and shared a range of unique governance and organizational structures. As laboratories of organization,

protest camps afford experience and enable experimentation with innovations in decision-making. At the same time, protest camps have led to the diffusion of horizontal modes of decision making across social movements and beyond. In this vein, the protest camps of the Occupy Movement have perhaps, more than any earlier protest camps, led to a diffusion of knowledge about horizontal decision making procedures. However, not all protest camps are run in a horizontal fashion and not all horizontality is equal. While many protest camps adapted and adopted such tactics as their basis for governance, the convergence between protest camps and horizontal forms of decision making in camps like Occupy needs careful examination and explanation. Drawing

on data collected from a large empirical study of protest camps, this paper examines the historic development of unique infrastructures of governance and organization at protest camps including procedures of decision making often drawn out in constitutions, handbooks or agreed upon regulations. Further, the paper develops the idea of "spatial practices" to conceptualise the represented and realized architectures of protest camps governance and organization infrastructures. Through analysing the historic development of these protest camp infrastructures, we aim to contribute insights to broader questions of organisation, and the political questions this evokes relating to autonomy, power and self-management.

## Affective Construction of Identities in Protest Spaces

**Tatiana Golova**, Otto-von-Guericke University, Magdeburg | [tatiana.golova@ovgu.de](mailto:tatiana.golova@ovgu.de)

The production of protest spaces is considered in this contribution as a case of emotional framing by movement networks and other public actors. A relational and action-oriented concept of space, influenced by a structuration approach, is applied in order to study how collective identities are (re-)created with regard to space. The field research focuses on political sites of the radical left-wing scene in Berlin, mainly on the protest events influenced by it. As the research shows, the question is rather "how" than "where" spaces of identity are. Through the protest practices, participants bring together symbolic and material/physical

aspects of spaces, constructing discrete and relational „non-landscapes“ of meanings. Further, the interactional spatial orders (such as "bloc" or "chain") are subject of emotional framing in their own right. The embodied and emotional character of protest events makes these mechanisms of identity construction particularly effective: In protest spaces, the symbolic relations and oppositions can be experienced not only on the cognitive, but on the emotional and body levels at the same time. The protest routines are spatial routines (Sewell) and emotional routines as well.

## b01RN25 - Movements, Digitalization, and Different Forms of Media

Chair(s): Alice Mattoni (EUI)

### The Struggle for Recognition: Suicide as Protest in Media

**Sang-Hui Nam**, Heidelberg University | [sang-hui.nam@soziologie.uni-heidelberg.de](mailto:sang-hui.nam@soziologie.uni-heidelberg.de)

This study explores how protest suicide is depicted in news media. Although many

studies of the movement tend to apply criteria to differentiate protest suicide from other types, according to Durheim, the line between the types is sometimes blurred. This is a contentious issue in the terrain of discourse and counter-discourse in the media. This study performs content analysis of a representative newspaper in Germany and South Korea. The two countries were selected based on their contrasting and conventional explanatory frameworks for suicide protest: political opportunity structure, cultural background, and official suicide rate statistics. News accounts over the last decade on protest suicide will be collected, and the keywords 'protest suicide' will be used in lexical variations in a broader sense—suicide in the public

space, massive protest as a consequence, or release of testament or statement. The contents of the collected news accounts will then be categorized according to frequency and further text interpretation. At the center of the content analysis are the following: attribution of causes (economic, political, cultural, or psychic factors) and expression of emotions as evaluative values (e.g., horror, grief, guilt, anger, indignation, and annoyance). The content analysis will show how social recognition of suicide as protest is related to struggles in media discourse. In addition, differences between the two countries will imply to what extent popular conditional factors for suicide protest correspond with the results of the media analysis.

## **Subversive Stitches: Craftivism, Guerrilla and Digital Media Use in Yarn Bombing Movement**

Manuela Farinosi, University of Udine | [manuela.farinosi@uniud.it](mailto:manuela.farinosi@uniud.it)

Leopoldina Fortunati, University of Udine | [fortunati.deluca@tin.it](mailto:fortunati.deluca@tin.it)

Yarn Bombing represents a worldwide, social phenomenon that combines together at least three different dimensions: urban guerrilla protest, do-it-yourself (DIY) culture and street art. The movement is predominantly made up by women and can be interpreted as a way to realize a peaceful protest and draw attention towards some urban problem. In the city context, the meaning of knitting and crocheting becomes completely different from the original one: from activities belonging to the housework and made for the family members, they have become social activities, carried out to "speak" in public and to interact with the urban environment. In this contribution, we focus our attention on a particular case study: a yarn bombing project realized in L'Aquila (Italy) three years after the 2009 earthquake, in order to "dress up" the main square, covering the gray metal barricades that still block the

entrance of the citizens to some areas of the center, and to add a sprinkle of color and warmth to the devastated city. In order to understand how the movement structures itself in the interplay between the online and the offline dimension and to investigate how the craftivists adopt digital media to organize, spread and report the collective action, we decided to deploy a multi-method approach. We conducted (a) an ethnographic study applying a grid of non-participative observation of the initiative in L'Aquila; (b) a qualitative content analysis of the online materials produced by the activists; (c) in deep interviews with the local organizers. The findings of the case study show how through an intense use of digital media this movement has been able to promote very complex and meaningful initiatives.

## Posting Protest, Tweeting Turmoil. Probing the Social Media Overture of the Pan-European anti-ACTA Protest

Dan Mercea, The Hague University of Applied Sciences | [d.mercea@hhs.nl](mailto:d.mercea@hhs.nl)

Andreas Funk, The Hague University of Applied Sciences | [a.funk@hhs.nl](mailto:a.funk@hhs.nl)

Paul Nixon, The Hague University of Applied Sciences | [p.g.nixon@hhs.nl](mailto:p.g.nixon@hhs.nl)

In the ongoing age of austerity, social upheaval seems to be fanned both by swinging cutbacks in public spending as well as an accelerated distribution of contentious politics via social media. The utilization of social media for protest has been portrayed as widening rifts in the collective solidarity of the old bonds around class and culture and, more ominously, corroding the links built around embodied socialization that have been central to recruitment into collective action and the construction of shared identities. Conversely, it has been suggested that collective action forms on the backbone of new, flexible and distributed organizational structures and modular identities fashioned by individuals that variably link in and out of protest networks. With this paper, we seek to investigate the ostensible co-construction of solidarity and

shared identities on two of the most prominent social media platforms, Facebook and Twitter, which were both used in the pan-European protests against ACTA. The starting point for this analysis is thus the three-pronged question: what were the topics, the participatory scope and the purpose of the communication that ensued on 29 Facebook event pages and the 19,000 tweets collected two weeks ahead of the last Europe-wide anti-ACTA demonstrations of 9 June 2012? Drawing on social and concept network analysis and content analysis, the paper's preliminary findings suggest such communication covered a multitude of topics to do with protest logistics, generating solidarity or engendering recruitment beyond the confines of the networks already 'wired' into the protest ecology.

## Communication-Based Interactions and Dynamics of (Self) Representation of Digital Network-Centred Movements: The Case Study of Purple People

Mario Orefice, University of Urbino | [mario.orefice@uniurb.it](mailto:mario.orefice@uniurb.it)

Wide penetration of digital platforms in socio-political realm if, on one hand, challenges monopoly on agenda making held by institutional actors, on the other, allows individuals, self-organized actors and spontaneous groups to give visibility to themselves, their identities and relevant contents per se (Melucci 1996, Bennett 2008). Moreover, in Italy recent history, marked by two decades of political leadership based on personalization of methods and programs (Helms 2005, Diamanti 2007), social media could be considered as a leading technology toward a post-modern political paradigm able to overcome party bureaucracy, patronage and

cooptation dynamics. However, political change has to be framed within structural evolution of society based on (networks of) social technologies which facilitate information production, propagation and consumption (Jenkins 2010, Castells 2012). Starting from this scenario, research project aims at investigating Purple People, an Italian social movement based on a network of Facebook public pages, which implemented connections among groups coming from different country regions and provided a "semi-public" space in which debates and negotiation of individual/collective social capital took place. Analysis will answer two research queries: •

What are structural features of digital network-centred movement? • What kind of narratives emerge from collection of personal accounts of engagement produced by online as well as offline members? Main findings arise from multi-perspective approach based on

content analysis of Purple People's Facebook pages, administration of digital questionnaire and in-depth interviews. Thus, I will attempt to get critical observation especially using an operational persp

## **Modified Election Posters. A Form of Low-Profile Protest**

Axel Philipps, Leibniz University, Hannover | [a.philipps@ish.uni-hannover.de](mailto:a.philipps@ish.uni-hannover.de)

Most visual studies focus on particular protest media such as posters, movement logos, or the media coverage about protest. In my research, I focus on modified election posters as a form of political culture-jamming, to express protest sentiments, or to articulate refusal. Modified election posters offer an opportunity to examine controversial public but low-threshold communication. A close examination reveals the views about political parties and topics of those who alter them. They point to controversial issues and lines of conflict. My presentation offers findings from two empirical studies on modified election posters. (1) a mayoral election and (2) a parliamentary election. The first study deals with a mayoral election in the German city of Leipzig in January 2013. It provides findings about differences among urban quarters, targets, and kinds of manipulation. The second analysis

offers a detailed examination of different kinds of practices to alter election posters in public space. For this purpose manipulated election posters of the German parliamentary election in 2005 are compared. This election took place after the expansion of the low-wage sector, reduced benefits for the unemployed, and follow-up protests in Germany. The presentation has two purposes. First, it seeks to promote visual studies and their contributions to protest and social movement research. Second, protest has many facets. It is articulated on the street during demonstrations and kept alive in various forms after public protest has vanished. It recurs, for example, in the form of modified election posters. For this reason, such visual interventions offer a promising access to more detailed analysis of protest practices.

## **c01RN25 - Beyond Western Europe: A Comparative Perspective on Movements**

Chair(s): Sabrina Zajak (Humboldt University)

## **A Social Movement Approach to Violent and Non-Violent Self-Determination Conflicts in Africa**

Anne Theobald, Eberhard Karls University, Tuebingen | [anne-lena.theobald@uni-tuebingen.de](mailto:anne-lena.theobald@uni-tuebingen.de)

Empirical evidence and theoretical work suggest that conflicts over self-determination are particularly likely to escalate into very

violent and protracted civil wars. Therefore and due to the particularities of Sub-Saharan African states, one could deduce that the

continent is especially affected by armed conflict over secession. However, there were – and still are – surprisingly little secessionist conflicts in Sub-Sahara Africa and very few of them are fought violently. Instead, in many instances social movements seek secession through non-violent protest. Prevailing theories on civil wars that mainly focus on structural factors at the macro level favouring conflict onset cannot explain why some African self-determination movements choose non-violent collective action, while others claim secession through violent rebellion despite similar circumstances. Thus, the paper

suggests integrating the framing approach – and by doing so a micro-perspective – into conflict studies. Framing reveals how movements interpret and construct their environment and how this translates into specific strategies of mobilisation and – violent or non-violent – action. Not only does such an approach help to identify micro-mechanisms explaining the escalation of violence, but it also yields insights into internal dynamics of (non-)violent protest movements as well as their strategic interaction with their environment.

## **Explaining Cross-Border Diffusion of Social Innovations: Sustainable Forestry in Russia and Labor Standards in China**

**Olga Malets**, Technical University, Munchen | [olga.malets@tum.de](mailto:olga.malets@tum.de)

**Sabrina Zajak**, Ruhr University, Bochum | [sabrina.zajak@staff.hu-berlin.de](mailto:sabrina.zajak@staff.hu-berlin.de)

We explore how social movement actors transfer and translate social innovations across borders. We analyze (1) the micro-mechanisms underlying transnational diffusion of ideas and practices and (2) their interaction with the institutional environment of adopting countries. We see diffusion not as a process of imitation of ideas or practices perceived as successful and legitimate, as suggested by early theories of diffusion as epidemiology. We argue first that the success of an innovation depends on the efforts and resources invested by actors we call intermediaries – e.g., social movement actors – into transplantation and adaptation of innovations, both discursive and structural, in a new context. The effectiveness of these efforts may be facilitated or limited by the institutional and political environment of adopting countries. We follow the sociological approach to diffusion as encounter with

embeddedness and diffusion as mediation and construction. Empirically, we show that the diffusion of international responsible forestry practices has been relatively successful in Russia where transmitting actors – local environmental movement activists – were able to adopt these practices to a challenging environment by using existing legal norms and practices as a resource and by cooperating with firms and state authorities. In contrast, the efforts of social movement actors to install new practices associated with the freedom of association and wage levels in Chinese factories were thwarted by preexisting institutionalized power imbalances between the state and workers and the hostility of the Chinese state towards these international norms. The state was able to channel the activities of labor activists away from these norms.

## **‘Remembering Bhopal’: Pursuing Recognition Across Scales**

**Pawas Bisht**, Loughborough University | [P.Bisht@lboro.ac.uk](mailto:P.Bisht@lboro.ac.uk)

The paper will present a comparative analysis

of the commemorative practices of the two

main social movement organisations (SMOs) seeking to secure justice for the survivors of the Bhopal gas leak of 1984, one of the world's worst industrial disasters. Drawing on ethnographic fieldwork conducted in Bhopal (2010-11), I will demonstrate how differences in the memorialisations performed by the International Campaign for Justice in Bhopal (ICJB) and the Bhopal Gas Peedith Mahila Udyog Sangathan (BGPMUS, Bhopal Gas Affected Women Workers' Union) constitute diverse mobilisations of the politics of recognition and scale. Employing the theoretical work of Axel Honneth (1995, 2003), I argue that the remembrance deployed by the SMOs can be productively analysed as working to remedy multiple and diverse violations of recognition experienced by the gas survivors. I

reveal how the SMOs engage in a conceptual critique of the justice enacted by state institutions, in an effort to expand both the substantive content of the recognition and the boundaries of the community to be recognised. I go on to demonstrate how while the SMOs are engaged in a shared struggle for recognition, differences can be observed both in the content of the recognition claims and the scalar locations of institutions and communities towards which the claims are addressed. I argue that these differences arise from different understandings of the nature and scalar constitution of the injustice caused. Overall, the argument would demonstrate the explanatory and evaluative advantages of supplementing a recognition model of justice with scalar considerations.

## 02RN25 - Mobilizing Knowledge. Conflicts and Struggles in the Sectors of Immaterial Production

Chair(s): Caterina Peroni, Alice Mattoni

### Publish to Perish: Labor Market Competition and Grassroots Resistance in the Social Sciences.

Markos Vogiatzoglou, European University Institute, Florence | [markos.vogiatzoglou@eui.eu](mailto:markos.vogiatzoglou@eui.eu)

This article addresses the Social Sciences as a sector of the broader Academic Industry, bearing its own internal structure, regulations, labor market and currency. The paper's focus is on the consequences of the increasing job competition inside the field, as well as the types of resistance its weaker members are developing. In recent times, the field's professionalization, the austerity cuts and the quantification of scientific value measurement have generated an immense pressure on junior academics towards conforming to the infamous slogan "Publish or Perish". The young scholars, a de facto precarious labor force, are investing significant effort and time in fleshing out and embellishing their CVs as a necessary means of survival in the highly

competitive labor market. Yet, as the job vacancies supply-demand disequilibrium has gradually transformed into a structural trait, an increasing number of researchers are either questioning the validity of the present skill measurement configuration or are trying to override the systemic thresholds they encounter. The set of resistances one may encounter can be classified into two broad categories: The collective responses, and the individual ones. The collective resistance includes practices such as a wide debate on open publishing and scientific work copyrights, the founding of alternative journals, exploring innovative research methods and techniques. The individual solutions applied, on the other hand, include not only stances of conscious

objection to morally disputable elements of the academic industry, but also a set of peculiar strategies with the intention of “cheating” whilst purportedly abiding by the rules. The latter includes activities such as the “no-show” conference participation, recycling the same paper for different purposes, multiple publications of translated versions of the same article and joint venture (or vanity) publishing. The collective forms of resistance - which could, indeed, fertilize the ground for a paradigm change in the Social Sciences internal organization- have proven, up to date, insufficient. Contrarily, the individual ones, despite their lack of any long-term perspective (other than assisting oneself in more successfully competing for a job post), pose a far more serious systemic threat. Since the Social Sciences’ internal evaluation system is

based on a currency comprised of citation counts and impact factors, cheats such as the above are actually home-made, money-printing machines. When taking place in a large scale, this set of practices produces inflation. And, since the human capacity of conducting research - even the worst quality one - is limited, social scientists might theoretically reach a point where the job post price will be so high, that non-cheaters will automatically be pushed out of the labor market competition. This point will signify the end of the “Publish or Perish” dogma. Based on an extensive set of interviews, participant observation and collaborative research, this paper intends to point out vulnerabilities in the present Social Sciences’ internal organization and highlight the great resistance potentials young scholars possess.

## Exploring the Voice of Macao: An Inquiry on the Role of Artistic Counter-Imageries in the Reconfiguration of Personalized Digital Spaces

Alberto Cossu, University of Milan | [alberto.cossu@unimi.it](mailto:alberto.cossu@unimi.it)

Maria Francesca Murru, Università Cattolica del Sacro Cuore, Milano | [maria.murru@unicatt.it](mailto:maria.murru@unicatt.it)

In May 2012 a skyscraper was occupied in Milan by a group of artists/art workers which gathered around “Macao”. Together with spaces, they claimed a new role for art and culture in society. Macao is only one case in a wave of artistic occupations which started in April 2011 when art workers occupied “Nuovo Cinema Palazzo”, continued with the occupation of “Teatro Valle”, always in Rome and then in Catania (December 2011), Napoli (March 2012), Palermo (April 2012), and Milan (May 2012). The paper we propose intends to investigate how the imageries related to such issues have been deployed in terms of linguistic and visual production within the digital social platforms where Macao and the other “nodes” of the artistic occupations are tightly connected. The starting hypothesis posits that the current networked and hybrid media landscape sets a new bundle of constraints and opportunities to the symbolic

processes through which new social movements establish their “collective voice” (Couldry, 2010) and claim for public recognition. Drawing upon the concept of “mediation opportunity structure” recently proposed by Cammaerts (2012), the study will focus on the mutual interdependence between the dimensions of “networked opportunity structure” and “discursive opportunity structure”. The first one will be studied through a quantitative analysis of the presence of Macao on Facebook, identifying networks of “virtual places” where it is visible and communicative forms enhance its visibility. Then, the “discursive opportunity structure” will be explored through the critical discourse analysis (including both text analysis and interviews to producers, see Fairclough 1995) of videos and texts produced by Macao and circulated through social media. The aim will be that of exploring how the voice of Macao,

thought an ensemble of self-narrations and counter-imageries around the value of public place and artistic work, gets articulated and socially reproduced within the interactive and strongly personalized digital media platforms. ## **Bobo Revolutionaries? The Transformational Potential of a Professional Group Using the Example of Architects**

Silke Ötsch, Innsbruck University | [silke.oetsch@uibk.ac.at](mailto:silke.oetsch@uibk.ac.at)

This contribution deals with the transformational potential of a professional group, namely architects. Movement research often concentrates on actors from social movements or politics, forms of innovation or subsistence. In the sociology of the profession, the resistance of professional groups to the "rules of the market" is an important topic. But it is often regarded under the aspect of protectionism and old boy networks without addressing the dis-embedding character of capitalism. May the resistance of a professional group play a role in a transformational strategy aiming to embed capitalism? The starting point of the investigation are qualitative case studies on the economic situation of architects in four

different capitalistic contexts (Austria, France, UK, USA). Architects were interviewed about their economic situation and their professional field. It turned out, that even if it became clear that the formerly elitist profession became precarious for most, interview partners often did not perceive systemic causes or felt unable to organize or even guilty. Nonetheless, there were initiatives to improve the situation of the professionals, the build environment or society. I look closer at these forms of organisation and resistance and try to classify them using typologies of movement research. Do these initiatives are transformational and to which extend, or do they enforce existing economic structures?

## **Standing for Culture in Paris and New York**

Bleuenn Lechaux, Rennes 2 University | [bleuennlechaux@yahoo.fr](mailto:bleuennlechaux@yahoo.fr)

This proposal is grounded on a comparative fieldwork conducted between 2005 and 2011 in Paris and New York. It builds upon 126 semi-directive interviews with theatre professionals and art journalists (*The New York Times*, the *Village Voice*, *Le Monde*, *Libération*, etc.). The fight for the recognition of culture takes different forms in both countries. In France, there exists an historical "intermittence regime" granting the artists working in the audiovisual, performance and cinema fields a specific status, provided that they fill in certain

conditions (amount of working hours in a certain period of time). In that context, artists stand up for their rights in cyclical protests, taking place "outside", in the streets and public places. In the US, the social and economic status of theatre professionals is less generalised than in France, insofar as it is reserved for Broadway workers. Thus, a lot of the artists interviewed struggle for the recognition of culture as a common good "from the inside", within their art productions and addressing directly the audiences rather than

public authorities. Artists from both France and the US transfer their professional know-how (narrations, costumes, subversion of symbols, plays on words) into social struggles. But whereas in France this transfer of artistic skills concerns professional and extra-professional issues (e.g. both artistic questions and the war in Bosnia), in the US, this transfer

is especially relevant for protests dealing with extra-professional issues, like the war on Iraq; the struggle for culture taking place within the arena of theatres themselves (time spent by theatrical companies to raise funds in order to pay their artists, political subjects of plays, etc.).

## b02RN25 - Movements and Gender

Chair(s): Nicole Doerr (Mount Holyoke)

### New Masculinities and Men in Dialogue

Oriol Rios, University of Barcelona | [oriolrios@ub.edu](mailto:oriolrios@ub.edu)

Marta Soler-Gallart, University of Barcelona | [marta.soler@ub.edu](mailto:marta.soler@ub.edu)

Masculinity is a topic that has been deeply analyzed in the last thirty years (Connell 1983, 1987, 2005; Kimmel, 1996, 2000; Kaufman, 2001; Flood, 1995). Through discourse analysis, previous research has highlighted the communicative aspects that reproduce hegemonic masculinity (Stobbe, 2005). However, such research has not explored the ways in which non-hegemonic masculinities are being reinforced. Men's movements are fighting for making alternative masculinity models more visible aiming to achieve gender equality and to eradicate violence against women. In Spain, the interventions planned by these movements are focused on sharing housework and taking care of children and ancients, and also on rejecting gender violence. But these interventions are designed from a language of ethics (Flecha & Puigvert, 2010) without taking attractiveness into

account. This language focuses on determining what is correct to do as egalitarian men without linking this with attractiveness and desire. In this regard, recent analyses show the power of egalitarian men's movements to promote a language of desire towards egalitarian men (Flecha & Puigvert, 2010; Portell & Pulido, 2012). This paper describes steps developed by an egalitarian men's association called Homes en Diàleg (Men in Dialogue). This association implements actions in order to promote alternative masculinities that could be egalitarian and attractive. One of these actions is open public spaces of debate on which model of attractive masculinity has been traditionally more influential and why, focusing on the social nature of this attraction. One of the elements that make these actions effective is linking attraction and desire to egalitarian masculinities.

### Comparing Feminist and Women's Standpoints on Bioethics: A Look at the Protests on Health in Italy

Liana M. Daher, University of Catania | [daher@unict.it](mailto:daher@unict.it)

All of the fights and battles of the Feminist and

Women's Movements, e.g. the fight for the

legalization of abortion and fertility treatments, involve bioethical values and choices. Most of the issues that arose dealt with women's bodies and thus led to a convergence with bioethics. The aim of the movements that sought equal rights for women's health in the fields of medicine and science is clear, that being to make them democratic. However, the struggles for citizenship and democracy often have different features, with regards to both their principle goals and expected results. From the Feminist standpoint, in fact, the above practices have to be free and depend only on the woman's choice (ethic of choice) whereas from the "feminine" perspective the defending of life and family come first (ethic of care). Moreover, if the two different ethical sides sometimes achieve the same conclusions, they are not inspired by the same

morals. With particular regards to some of the issues related to women's health, the laical and Catholic viewpoints are in conflict. For example, today in Italy the law n. 40/2004 on "in vitro fertilization" had several limitations that are socially justified by bioethical reasons. These reasons, however, pertain to Catholicism, and are not laical in nature. This fact can lead to several questions regarding the power relationship between the State and the Catholic church, relate to the grounds and justifications of the above side's (feminist and "feminine") bioethical reasons, and so on. The aim of the paper is to focus on the reconstruction of the debate, through the analysis of documents and focus groups with activists so as to arrive at some conclusions regarding present-day conflicts in Italy.

## Women's Activism in Islamic Movements: Case Studies in Israel and Europe

Inbal Tal, The Max Stern Yezreel Valley College | [tal\\_inbal@yahoo.com](mailto:tal_inbal@yahoo.com)

One of the most important trends in the Arab world and in the Islamic countries in the 20-21st centuries has been the involvement of women in the social and political sphere. Of course, not all women activists belong to Islamic movements, but these movements have also shown an increase of political and social participation of women. This trend is also evident in the Islamic Movement in Israel, as well as in various Islamic movements which operate in Europe. This lecture, based on a variety of preliminary sources and personal interviews, will focus on the inclusion of women in different activities in the fields of education, welfare, women's institutions,

communications, students' organizations and municipal politics, in institutions and organizations affiliated with the Islamic Movement in Israel. We will also bring the positions of the Movement's leaders concerning the participation of women in the Movement's activities. We will further discuss the implications of this trend on the unique characteristics and future of the Islamic Movement in Israel. We will then turn to look at the similarities and differences between women's activities in the Islamic movement in Israel and in those movements in the European arena.

## a03RN25 - Typologies of Political Violence

Chair(s): Lorenzo Bosi, Niall O'Dochartaigh

### Violent Youth Protests: Reflections from Two Case Studies in France (2005) and England (2011)

Irene Rossetto Giaccherino, University of São Paulo | [irene.rossetto@usp.br](mailto:irene.rossetto@usp.br)

Benno Warken Alves, University of São Paulo | [benno@usp.br](mailto:benno@usp.br)

The study of violent protests in the urban peripheries of British and French cities offers the possibility to analyze the relationship between culture and collective action. Besides the specificities, the two episodes keep several similarities. Both are violent protests triggered by acts of police violence. The victims and the first participants are young, with foreign origin, living in poor and marginalized areas. The death of young people - and the attempt to cover up the misconduct of public officials - leads to localized and circumscribed clashes. A second episode of police abuse quickly spreads the protests across the countries. Expressions like "broken society", "sick communities", "moral collapse" are recurrent in the press and in political speeches. The moral decay of youth, the weakening of community ties, the poor neighbourhoods are blamed for the violence. Nevertheless, the theme of

irrationality and contagion can be contrasted by a more stimulating reading of violent protests through the lens of Political Process Theory. Following Tilly's interpretation, the violent clashes would be - not irrational and individualistic acts - but a kind of contentious collective action, with the same nature of other phenomena (like social movements, parties, revolutions), differing only by the degree of use of violence and organization. The analysis on similarities and differences in the political opportunities structures of the two violent protests opens a wide field of research on the mechanisms and forms of violent collective action. Moreover, the challenge is to understand why a violent repertoire is spreading again in societies where institutional and more organized forms of mobilization are widely developed.

## Political Violence as Communication: Revisiting the Boundaries of a Common Concept

Florian Edelmann, Aberystwyth University | [fle@aber.ac.uk](mailto:fle@aber.ac.uk)

While 'terrorism studies' is still far from reaching a concise and consensual definition of its core concept scholarly discourses evolve along interrelated dimensions and seek to delimit the phenomenon from other forms of political violence. The most important of these dimensions, it is argued here, is to associate 'terrorist' violence with aspects of communication: inflicted atrocities transport a message concerned with political objectives and aim at indirectly enforcing socio-political changes. Yet, 'communication' usually does not inform conceptual thinking about 'terrorism'. My central argument is that restricting 'communication' to its merely instrumental aspects severely curtails its potential explanatory power. Rather, I propose a theoretical approach that allocates a central position to communication: significant features of 'terrorism' and of its protagonists immediately result from the imperatives and constraints of (violent) communications.

'Terrorist' groups not only employ violence as a means of communications. As a social system, 'terrorism' consists of interrelated communicative acts. This framework draws on Niklas Luhmann's re-formulation of social systems theory in terms of the autopoietic structuration of the social from interrelated communication processes. Especially, his reflections on the role of protest and social movements inform the argument. The paper unveils specific conditions and hindrances 'terrorist' groups confront when ensuring organisational endurance within a presumably hostile social environment which are traceable in practices of violent communication. The paper thus contributes to theoretical re-framings of political violence that offer new ways of comparing and understanding cases of 'terrorism' by focusing on actual legitimisation strategies rather than mere ideological affinities.

## Transitions from Armed to Unarmed Resistance: Relational Dynamics between Social Movements and Insurgency Groups

Veronique Dudouet, Berghof Foundation, Berlin | [v.dudouet@berghof-foundation.org](mailto:v.dudouet@berghof-foundation.org)

This paper investigates the nature and the drivers of transitions from armed strategies to nonviolent methods of contentious collective action on the part of non-state conflict actors. It focuses in particular on internal (cognitive, organisational) and environmental factors which underpin the decision-making process within social movements. The strongest factors are identified in the relational dynamics between organised armed actors and their unarmed allies within broader social

movements, which could be variously described as a 'mirroring', 'reversed outbidding' or 'coalition-building' mechanisms. The analytical framework builds on a cross-disciplinary literature review while the findings are drawn from fieldwork-based empirical research on self-determination or revolutionary movements in Nepal, Egypt, Palestine, West Papua, East Timor, Mexico, and Western Sahara.

## **b03RN25 - A Global Dissenting Youth? Session One: Student Movements and Youth Activism, anti-Austerity and anti-Corporate Mobilisations**

Chair(s): Lorenzo Zamponi (EUI)

### **The Student Movement in Barcelona: A Renovated Movement against Austerity Measures?**

Joseba Fernández González, UPF | [josebafergon@gmail.com](mailto:josebafergon@gmail.com)

In the framework of the FP7 MYPLACE (Memory, Youth, Political Legacy and Civic Engagement) research project, an intensive ethnographic study on the student movement of Barcelona has been carried out between October-December 2012. In the process of data collection, we interviewed 30 student activists with different backgrounds and written fieldwork diaries during several demonstrations, strikes, and assemblies of the student movement. According to the results of this research, we conclude that the main classical features of the movement are its discontinuity, the highly changing forms of organization, and the innovations in the protest repertoire actions. We claim that a renovated student movement in terms of practices and discourses is emerging in Barcelona due to two factors. Firstly, the current context of

recession of the Spanish economy and the hard austerity measures approved by the Spanish and Catalan governments. Secondly, the new wave of mobilization developed around the world in the last years. The goal of this paper is to analyze how in this new context (economical crisis and increasing social protest in Spain consequence of the austerity measures) the public image of the movement might have changed. Thus, we will also analyze the perception that the own activists have about the success and the failure of the movement. Moreover, we will address the way in which Political Opportunity Structure is now partially in favor of the movement because of having more potential allies. These allies allow the student movement to coordinate its demands and protests with other social movements.

### **Calling for Equity-Enhancing Reforms in Chile: Reconstructing the Student Movement's Master Frame on Inequality**

Sofia C Donoso, University of Oxford | [sofia.donosof@sant.ox.ac.uk](mailto:sofia.donosof@sant.ox.ac.uk)

As Nancy Bermeo lucidly formulates, 'inequality is a constant in political life, but its salience in political discourse rises and recedes'. How do social movements engage bystanders in their calls for equity-enhancing reforms? Chile's Student Movement and its construction of a master frame focused on education and inequality provides a fruitful case study to explore this question. In Chile, a country with one of the highest Gini coefficients in the world, the education system – which underwent a sweeping restructuring along the

neoliberal lines during the military regime and has been kept largely intact since then – has in recent years become the locus of contention. For a generation too young to remember the military regime, and for whom education has been promoted as the mechanism of social mobility for more than two decades, the notorious inequalities produced by the education system became unbearable. During 2011 and 2012, university students staged the largest mobilizations the country had witnessed since the reinstatement of

democracy in 1990. Giving proof of a great leadership, the movement has elaborated a collective action frame which expanded from sector-specific demands such as a public, free and high-quality education, to a broader discourse that calls into question the unequal development path undertaken by Chile since

the end of the authoritarian regime two decades earlier. Tracing the construction of the Student Movement's master frame on inequality, the paper investigates the continuities, ruptures, and learning processes undertaken after earlier protest waves staged by Chile's students.

## **Dissenting Students. The Impact of the “Onda Anomala” on the Italian Universities**

**Lorenzo Cini**, European University Institute, Florence | [lorenzo.cini@eui.eu](mailto:lorenzo.cini@eui.eu)

Over the past few years European students have mobilized to oppose the cuts in the spending for higher education. These mobilizations have produced effects not only on the political system as a whole, but also on the way in which universities function and are organized. In other words, student mobilizations have had an impact on the higher education system itself. This has been the case of a recent protest campaign in Italy, known as the “Onda Anomala” mobilization, which has occurred to protest against the “Gelmini laws” in 2008. Italian students have in fact raised their criticisms towards the academic institutions to demand an alternative organization for higher education. In this paper, I will look at the effects of the “Onda Anomala” on three individual universities: the “University of Turin”, “La Sapienza” of Rome, and “Federico II” of Naples. For each university I will investigate to what extent the local

student movement has produced effects on their decision making bodies (the academic senate and the board of administrators) in terms of “agenda” and “policy” impacts. My hypothesis is that movements with high levels of mobilization and disruptiveness have had a greater capacity to affect the academic decision-making than movements with low levels. To empirically test this hypothesis, I will divide my research in two stages. First, I will conduct a protest event analysis on the local chronicles of “La Repubblica” of Turin, Rome, and Naples to measure the levels of mobilization and disruptiveness of each movement. Then, I will analyze all the agendas and deliberations approved by the two decisional bodies during the period of mobilization to see both how many issues proposed by the students have been discussed (agenda impact) and how many of them have been adopted by the academic bodies.

## **Chilean 2011 Student Movement in the Light of Contentious Politics**

**Benno V W Alves**, University of São Paulo | [bennowa@gmail.com](mailto:bennowa@gmail.com)

**Irene R Giaccherino**, University of São Paulo | [irene.rossetto@gmail.com](mailto:irene.rossetto@gmail.com)

Chilean students have been, in 2011, the protagonists of one of the biggest social movements in the country's history. Although the movement has had multiple facets and the events have been shaped by the connections between the students and many other social actors, international media tended to focus on

the big street manifestations and on the role of the youth in the protests. Two outcomes, seen as opposite, have captured the attention both of the media and of the academic analysts: the creativity of the protests and the eventual violence of the conflicts with the Chilean militarized police. Using Charles Tilly's

concepts on social movements, we try to interpret the 2011 movement in the light of Chile contemporary history. In addition, instead of opposing the two more “dramatic” outcomes

of the protests – as did the media in general and most of the analysts –, we try to explain them as emerging from strategic variations used by the actors in the contention.

## The Identity Narrative of the Californian Student Movement

Anna Schwenck, Humboldt University, Berlin | [annaschwenck@posteo.de](mailto:annaschwenck@posteo.de)

The student protests at the University of California, Berkeley can be seen as both a harbinger of the Occupy California protests and as a manifestation of a more global student movement. Although student protesters at Berkeley emphasized the more immediate results of austerity, they linked their actions to global processes of neoliberalization. My first thesis is that the linkage between local manifestations of neoliberalist restructuring and the global dimension of neoliberalism is a precondition for mobilization in the anti-austerity protests. Moreover, issues of critical concern to protesters and existing organizational bodies had to be integrated in the framing of the protests during the course of events. Whereas the initial rallies and actions profited from a moral shock (Jasper), the success of subsequent mobilizations

depended on the alignment of existing differing logics of inequality. The latter are rooted in different worldviews. This divergence was especially observable in the severe disagreements on tactics. The varying logics demanded different tactical approaches, which often stood vis-à-vis each other. Thus, my second thesis is that protesters had to actively address previous societal struggles specific to their local and national context and engage in consciousness raising work to inform about those struggles in order to sustain the movement. Drawing on recent contributions from the sociology of storytelling and narrative to the study of movement identities, I will show how the Californian protesters managed to integrate the diverging perspectives and link the local with the global.

## a04RN25 - Alter-IGOs: Encounters between International Organizations and Oppositional Movements

Chair(s): Thorsten Thiel

### On the Paucity of Concepts for the Study of the Interactions between SM, IOs and States...

Helena Flam, University of Leipzig | [flam@sozio.uni-leipzig.de](mailto:flam@sozio.uni-leipzig.de)

A look at the US literature on the interactions between the SMs and the IOs (or any authorities in fact) shows that there are very few concepts with which to investigate these interactions. In my presentation I will present several US approaches to the study of such

interactions - mostly drawing on social movement research, but also taking up a few texts in International Relations - to present a list of concepts that have been made available so far. The next step will be to review the 'European' literature to do the same, in this

manner preparing the ground for new conceptual and theoretical work.

## Depoliticization as a Reaction to Social Movement Demands

Jannik Pfister, Goethe University, Frankfurt | [pfister@soz.uni-frankfurt.de](mailto:pfister@soz.uni-frankfurt.de)

Since the rise of the Global Justice Movement, sociologists have time and again highlighted the demands different social movements direct towards institutions of international politics, aimed at redressing imbalances in intergovernmental organizations like the WTO or the IMF or at changing the infrastructure of global governance as found in the G8 or other fora. Yet only recently, scholars from International Relations have started to go beyond a narrow scope on accountability in governance and have begun to investigate the effect of attempts by members of the 'civil society' to politicize international organizations and their policies. But if we take social

movements, an important element of democratic politics, into account, a different picture might present itself to us: International organizations cannot only be politicized, but also react with depoliticization to attempts to do so. In my contribution, I will offer a preliminary analysis of exemplary cases for such depoliticization in interaction with social movements, and discuss its consequences for normative theorizing on global governance with regard to the interplay between opposition and institutions. A renewed call for transparency – but not limited to a liberal accountability agenda – as main leverage against depoliticization will be discussed.

## Popular Protest, EU Activism and Change: The Case of ACTA

Louisa Parks, University of Lincoln | [lparks@lincoln.ac.uk](mailto:lparks@lincoln.ac.uk)

The paper will focus on the protest movement against the Anti-counterfeiting Trade Agreement (ACTA) to investigate how the EU reacts to protest campaigns and the activism of EU institutional actors. The Commission signed ACTA in early 2012, yet as protests against member state signatures emerged it referred its decision to the European Court of Justice in an apparent bid to delay ratification. In the meantime, physical and virtual protests spread (e.g. by Pirate Parties, Anonymous, Wikipedia) and European Parliament actors campaigned against the agreement. The first rapporteur resigned, and the Greens-EFA political grouping was vocal in its opposition, allying with European level groups against ACTA. In July 2012 the Parliament declined its consent to ratify. The ACTA campaign appears to show a quick EU response to widespread national

protests. The paper will investigate the case to confirm or refine this possibility. Political process theory specifically adapted to the transnational arena of the EU will guide the study. The paper will contribute to knowledge of encounters between IOs and oppositional movements by shedding light on a relatively little studied phenomenon, i.e. protest targeting specific EU actions, by paying attention to the interaction between national protest and complementary conventional actions by Brussels-based groups and the work of EU insiders in securing a change in the EU position. By comparing the campaign with previous research by the author on social and environmental campaigning in the EU, the work will also highlight if and how campaigning in the EU has changed in recent years.

## Interregional Governance and Transnational Civil Societal Opposition: Selective Convergence over Time?

Sabrina Zajak, Ruhr University, Bochum | [sabrina.zajak@staff.hu-berlin.de](mailto:sabrina.zajak@staff.hu-berlin.de)

This article takes a closer look at the development of interactions between international organizations and social movements at a special case of interregional economic integration between Europe and Asia: the so called Asia-Europe Meetings (ASEM) and its counter mobilization. While transnational mobilization against and in the context of international institutions is a highly researched phenomenon, little attention has been paid to civil society participation in a rather different form of international governance – interregional governance. The paper argues that over time, transnational civil society opposition in form of the People's Forum contributes to both discursive and institutional changes within the official ASEM

process, indicating an increase in informal access and selective responsiveness. However, the analysis reveals that the social construction of access and voice is not only a response to counter mobilization. It is embedded in developments in other international governance arenas and at the domestic level in particular in less democratic regimes in Asia. Thus the responses within ASEM can only marginally be explained by movement actions: Other actions within states and at the international level increase the positive resonance to selected movement demands. This process can be described as selective congruence of social movement demands and international organizations.

## b04RN25 - Middle Class and Youth Protests: Differentiated Reactions to a Global Crisis?

Chair(s): Nicole Doerr (Mount Holyoke)

### 'Loud and Proud': Youth and the Politics of Silencing

Hilary Pilkington, University of Manchester | [hilary.pilkington@manchester.ac.uk](mailto:hilary.pilkington@manchester.ac.uk)

Robert Grimm, Manchester Metropolitan University | [r.grimm@mmu.ac.uk](mailto:r.grimm@mmu.ac.uk)

This article considers the cultural context and expression of 'extreme right' views among young people in Germany, Russia and the UK. These countries are selected as they represent a range of political heritages (national socialism, state socialism, neo-liberalism) yet, in all three contexts, we suggest, young people perceive some degree of the closing down of 'legitimate' political discourse as a result of the social distance between 'politicians' and 'people like us' and the legal and cultural circumscriptions on 'acceptable' issues for

discussion. The paper draws on survey data and semi-structured interviews in 6 case study locations (across Germany, Russia and the UK) generated from the authors' participation in the FP7 MYPLACE project. It traces how young people experience formal politics as a 'politics of silencing' and the relationship between perceived 'silencing' and the expression of 'extreme' opinions and practices and support for, and/or participation in, 'extreme right' movements. The paper also considers responses to this perceived silencing drawing

on ethnographic case studies of patriotic or far-right movements in each of the three countries. Finally, we consider the implications of our findings for those very (educational,

political, cultural) communicative practices that seek to prevent receptivity to extreme right political agendas.

## The Winter Rose Revolution: Student Protests in Hungary

Daniel Mikecz, Eötvös Loránd University, Budapest | [daniel.mikecz@gmail.com](mailto:daniel.mikecz@gmail.com)

The still ongoing Hungarian student protest campaign started in December 2012 referred as the 'winter rose revolution' by the media and the protesters as well. The direct triggering event was the proclamation of cutting the number of state financed places for prospective students. The right-wing government decided to make higher education step-by-step 'self-financed', students should pay for their studies. In order to support them a new loan system with state guarantee was introduced. However, in a country which was strongly affected by the financial crisis, young people don't want to begin their professional life with a high debt. Another neuralgic point is the case of the so called 'student contracts' which are considered as some kind of feudal bondage, since these contracts obligate the scholarship holders to stay and work in

Hungary after graduation at least twice as long as the their studies lasted. If you can't exit use your voice! Nota bene, in Hungary higher education was free for those who achieved the necessary entry requirements. The students were the first protesters who succeeded to make the government accept at least some of their demands. On the other hand and a new, until now apolitical generation appeared on the stage of Hungarian politics. The rejection of the student contracts is the articulation of the demand to control one's own destiny, to be internationally mobile, and not to be a mere instrument in the hands of a corrupt political elite. I want to analyze this question from the aspect of intergenerational conflict and contemporary discourses on citizenship, whether the individual can be simplified to human resource by the state or not.

## Distributive Grievances and Socio-Political Blockages: The Role of Middle-Class Youth in the Israeli Social Protest Movement

Zeev Rosenhek, Open University of Israel, Ra'anana | [zeevro@openu.ac.il](mailto:zeevro@openu.ac.il)

Michael Shalev, Hebrew University, Jerusalem | [michael.shalev@gmail.com](mailto:michael.shalev@gmail.com)

The literature on new social movements argues that contemporary protest movements embody a postmaterialist shift, hence the propensity to protest rests on subscribing to particular values and identities rather than on distributive grievances. The recent wave of protest in Western countries, however, challenges this reading. While educated young people have clearly been the major players in these protests, their demands are squarely redistributive. We study the Israeli case as a research site to examine interactions between

distributive grievances and socio-political blockages as sources of the current wave of protest. The analysis of grievances focuses on the intersection between class and generational dynamics and their connection to the transformation of Israel's political economy. Towards the end of the decade which preceded the protests, perceptions of material conditions and prospects of young Israelis with middle-class backgrounds worsened in comparison with other groups. While rising living standards marked their formative

experiences, as young adults many encountered declining opportunities to maintain the lifestyles experienced in their parents' households. At the same time, a clash of collective identities with the currently dominant political forces in Israel created both actual and perceived blockages to influencing policy through "conventional" means among

the educated middle class young people who led the protests. Our conclusion is that discontent fed by declining life chances, coupled with long-standing conflicts around the distribution of socio-political power, politicized distributive issues and fed demands for a more activist economic role for the state.

## **a05RN25 - Crisis, Critique and Democracy in Social Movements**

Chair(s): Nicole Doerr (Mount Holyoke College)

### **Inside the World Social Forum. How a Transnational Coalition of Civil Society Actors Persists as a Movement since 2001.**

Christian Schroeder, University of Hildesheim | [christian.schroeder@uni-hildesheim.de](mailto:christian.schroeder@uni-hildesheim.de)

The World Social Forum has claimed to provide a platform for a growing global civil society since the first meeting in 2001. Following their Charta the World Social Forum understands itself as an "open space" for discussion. This idea is about people who meet in one of the forums on local, national, supranational or global level and share an issue on alternatives to neoliberalism. Apart from this exchange, it is not wanted to develop some sort of binding commitment out of the forum's meetings as e.g. a final statement or strategy paper. The Charta actually rejects all forms of organization like formal structure, membership or hierarchy. Anyway to provide this "open space" there is a need of organization. This raises the question on how transnational coalitions of movements guarantee their existence over long periods of time without transforming itself into an

institution. An ethnographic approach which uses – besides document analysis and interviews – mainly participant observation of the International Council meetings, in the office in Sao Paulo and the preparatorial team for the World Social Forum in Tunis shall bring light into the fluid organizational structure, the members relations and the decision making process. An interplay between empirical research and analysis will finally lead to a data based theory. A sketch of this theory of the fluid structure of a transnational movement coalition – the World Social Forum – will be the core focus for the presentation and discussion. It shows how crises, critique and democracy are issues which permanently have to be dealt with inside the World Social Forum and at the same time permit the movement to persist over time as a movement.

## **Making Democracy Competitive: Struggles between Mobilized Citizen and Local Elected Representative for the Definition of Democracy**

Lucie Bargel, University of Nice | [bargel@unice.fr](mailto:bargel@unice.fr)

This proposal draws on a case study, a mobilization against a reform of the local institutions within the Roya valley in France, which is a border zone with Italy. More specifically, I will look at the use of democratic techniques and pleas by the groups mobilized (citizens, local associations as well as some local elected representatives), and how these claims are refuted by their opponents. This interactive process leads to a particularly interesting episode, where the groups mobilized organize a referendum, using all the

techniques of a local election (polling booth...), although it has been forbidden by the prefect and is thus illegal. As well as the process itself, its results are strongly discussed, and specifically put in regard with the results the local elected representatives promoting the reform have obtained when they got elected. This example will enable me to examine how the social movement and their opponents struggle around competitive definitions of democracy.

## **The Political Translation Deficit: A Critique of Democracy, Deliberation and Inequality in Social Movements**

Nicole Doerr, Mount Holyoke College | [ndoerr@amtholyoke.edu](mailto:ndoerr@amtholyoke.edu)

The Political Translation Deficit is made out of cultural norms and habits that invisibly impede people from understanding each other while positively ordering, structuring and normalizing democracy and deliberation in social movements. Surprisingly, multilingual settings and their entailed difficulty in understanding can sometimes temporarily challenge the political translation deficit through the attuning power of linguistic translation. Linguistic translation has a transformative potential because it makes us experience two things at the same time: First, it realizes the radical human condition of difference through linguistic misunderstandings, and second, it works with

our basic need, wish, or pleasure to understand others. This paper shows how activists used the transformative power of attuned understandings and the pleasure and insights gained from 'political translations' to make powerful people change their decisions— not only in multilingual settings but also in monolingual social movements. Based on an empirical comparison of multilingual and monolingual deliberation in the United States Social Forum and in the European Social Forum, the paper accounts for the impact of political translation, and identifies the conditions for its success or failure in transnational, national and local arenas of politics and protest.

## The Indignados Movement in Barcelona. Framing the Crisis and Democracy

Viviana Asara, Autonomous University of Barcelona | [viviana.asara@gmail.com](mailto:viviana.asara@gmail.com)

2011 has witnessed a “new cycle of protest”. After the so-called “Arab spring”, citizens movements have swept across Western countries, starting from the demonstrations of the “Geração a Rasca” in Portugal, then taking a much wider scope in May in Spanish squares, and resonating in other European cities under the “indignados” and “Occupy” umbrella terms. This paper aims at shedding light on how the indignados (15M) movement in Spain frames its perception of the crisis and the potential solutions to it in order to change a situation seen as unjust, and how this articulation relates to conceptions of „real democracy“ by the movement, by taking a diachronic perspective. In order to identify frames, participant observation undertaken for over one year and half in Barcelona is complemented with thematic analysis (Johnston, 2002) of transcripts of 35 in-depth

interviews and 4 focus groups, and of documents produced by the movement. The indignados movement has been depicted as having been ignited as a response to the global economic crisis and the approaches taken by the European Union and the Spanish government to handle it. It is argued that, while prompted by the crisis, the 15M is not simply issue driven. It develops a critique of overall society. The metapolitical critique (Offe, 1985) is intrinsically linked with the identification of a “multi-dimensional crisis”, involving not just an economic, but a political, social and environmental dimensions, motivating the need for deep structural society changes, involving the core of its symbolic production, values. The paper also tries to shed some light on the uniqueness traits of the indignados movement, as compared to its closest cousin, the alterglobalization movement.

## Neoanarchism and the New Spirit of Capitalism: Prefigurative Politics from the Alterglobalization Movement to Occupy Wall Street

Blair Taylor, New School for Social Research | [blairfett@yahoo.com](mailto:blairfett@yahoo.com)

Accounts of the antiglobalization movement often identify repression of dissent post-9/11 and the shift to an antiwar frame as the main causes of demobilization. But what if the alterglobalization movement faded not because it failed, but rather because it succeeded? Movements of the 1990s popularized a moral critique of corporations; thus they changed corporations, not the world. Today business speaks the language of movements: various forms of ethical consumption are now mainstream political discourse and consumer habitus, from organic food to alternative energy. At the level of production, movement critiques have translated into decentralized workplaces, flexibility, informality, and shifts towards a

post-material/affective economy. Yet these transformations occurred while the social movements that once proposed such solutions – until recently – have been in decline. Building on the works of Luc Boltanski and Eve Chiapello (2000) and Nancy Fraser (2009), my paper examines how the recuperation of social movement themes is constructing a “New Spirit of Capitalism.” This paper interrogates the latent affinities between neoanarchism and neoliberalism, arguing that the micropolitical and “prefigurative” orientation of neoanarchism dominant within the alterglobalization movement and living on in Occupy Wall Street has facilitated the explosive growth in the discourse of “ethical capitalism,” a process which also insulates it from critique.

The authoritarian legacy of 20th century Marxism has given rise to a politics that seeks to “change the world without taking power,” a

process which has redefined the historical left and poses serious theoretical and practical problems for social movements today.

## **a06RN25 - Social Movements and Emotion Session One**

Chair(s): Helena Flam (University of Leipzig)

### **How Emotions Change Protest. A Proposal of Analysis.**

Alice Poma, University Pablo de Olavide, Seville | [alicepoma@hotmail.com](mailto:alicepoma@hotmail.com)

Tommaso Gravante, University of Seville | [t.gravante@gmail.com](mailto:t.gravante@gmail.com)

The aim of the paper will be to present our proposal of analysis about the role of emotions in local protests. Focusing on the analysis of the conflict from below, we have paid special attention to the emotions felt by the protestors and their consequences in the dynamics of the protest. Based on the first results of our research we can affirm that emotions are a useful explicative factor of these experiences of protest because they are present in every phase and every aspect of protest. We have seen that emotions play an important role in the day-to-day practices of the groups we have studied and that they interact with cognition in determining individual's behaviour. Emotions not only motivate individuals but they might

change their beliefs too. In conclusion, we have seen that emotions play an important role in protest. They not only influence motivation and recruitment, but also affect some outcomes of protest, like empowerment. The methodology that we have developed in our researches is based on depth interviews, story life and narrative analysis of the biographical material. We gave special attention to the different labels that we have assigned to different emotions, feelings and moods that play an important role in the protest. We will present some results based on analysis of a specific case studies: the insurgency of Oaxaca, Mexico, in 2006 and some grassroots environmental conflicts in Spain and Mexico.

### **Fear Management Mechanisms in Protests against Repressive Regimes**

Hank Johnston, San Diego State University | [Hank.Johnston@sdsu.edu](mailto:Hank.Johnston@sdsu.edu)

This essay is a theoretical exploration of fear management among oppositional and democratic activists in repressive regimes. It draws upon a wide range of contemporary examples of protest in China and the Middle East, plus several the author's empirical field studies of the democratic opposition in Spain, the former Soviet Union, and Eastern Europe to suggest a robust model of fear reduction mechanisms in states where protest activism carries high risks. There is a large body of

research that takes the costs of action as the key variables the repression-mobilization nexus. In contrast, this paper assumes that perceptions of costs and how they are weighed against perceived opportunities and payoffs are colored by emotional states, most notably fear. Drawing on a mechanisms-and-process approach that stresses the relational and dynamic aspects of political contention, this essay offers a two-step model of fear reduction processes: (1) Initial steps to transcend

preference falsification among a fearful public in repressive states. Mechanisms of the first step comprise what I label, the resistant repertoire. (2) Managing fear of the police and security apparatus during protest events that increasingly take on elements of the standard

modular repertoire. This occurs as fear among the public decreases and participation in the opposition grows. Elements of the model in both stages include anonymity, solidarity, duplicity, and tactical creativity.

## **The Emotional Dynamics of a Local Environmental Protest against the Sitting of Waste Management Facility: The Case of Keratea**

**Angelos Evangelinidis**, Postgraduate Student | [angelosevans@gmail.com](mailto:angelosevans@gmail.com)

Aim of this paper is to present the relationship between collective identity and emotions in a local NIMBY grassroots movement against the sitting of a waste management facility in the city of Keratea, positioned in the outskirts of Athens, Greece. For more than 128 days the citizens clashed with police forces demanding their withdrawal from the area using violent forms of action. Furthermore, the paper is trying to explain the emerging emotional dynamics that are created due to police repression and consequently forced the activists to use forms of direct action. Based on in-depth interviews the activists, I focus on the examinations of the emotions that arise during the movement and they are divided into

emotions towards each other and towards the police. It is examined that there is an intensification of the emotions during the evolution of the protest. Also, I observe the transformation of emotions e.g. from anger to hate due to the violence of the opponents. The arising emotions strengthen the collective identity of the activists which in turn reveal emotions that reinforce the local movement and support the consistency of the protestors and keeps them dedicated to the achievement of their goals. I conclude that emotions offer a satisfactory explanation for the action of actors in the case of Keratea and shape the understanding of emotions.

## **Emotional Constellations of Demonstrators; The Impact of Political Allies**

**Dunya MM van Troost**, Free University, Amsterdam | [d.m.m.van.troost@vu.nl](mailto:d.m.m.van.troost@vu.nl)

**Jacqueline van Stekelenburg**, VU University, Amsterdam | [j.van.stekelenburg@vu.nl](mailto:j.van.stekelenburg@vu.nl)

**Bert Klandermans**, VU University, Amsterdam | [p.g.klandermans@vu.nl](mailto:p.g.klandermans@vu.nl)

This paper focuses on 5.000 demonstrators and their emotions dispersed over 38 demonstrations in eight European countries. Demonstrators are f.i. angry about austerity measures or worried about nuclear power. We depart from the notion that emotional constellations originate in the political context. This because the political context constitutes constraints or opportunities to further the claims voiced by the demonstrators. Constraints encompass the absence of political allies in parliament and opportunities the

presence of allies in parliament. This paper examines to what extent the emotional constellation differs as a function of the presence or absence of political allies. However, every issue knows its own opportunities and constraints based on the parliamentary composition. We focus on the emotional constellation evoked by environmental issues (e.g. Climate Change and nuclear energy) and anti-austerity measures. For the environmental issues the Green Parties are supposedly the natural allies, while

for anti-austerity issues the allies are the social democratic parties. Thus—in design terms—we test in a multi-level design, the emotional constellation of individual demonstrators originating in eight parliamentary constellations for two different issues. We hypothesize that demonstrators in a constraining political context experience worry and fear, while anger and frustration dominate

under opportune political conditions. This implies that the more allies in parliament, the greater the opportunities to influence policy and thus the more efficacious demonstrators feel and the angrier they are. The fewer allies in parliament, the greater the constraints and thus the more powerless demonstrators feel and the more fearful and worried they are.

## **b06RN25 - Austerity Protests in Comparison**

Chair(s): Nicole Doerr (Mount Holyoke)

### **Protest, Space and the Emergence of a New Political Culture in Greece**

Marilena Simiti, University of Piraeus, Athens | [fiona1@hol.gr](mailto:fiona1@hol.gr)

The current neoliberal crisis has led to widespread mobilizations against the austerity measures imposed all over Europe. In Greece a massive Occupy movement emerged at Syntagma Square, becoming the main locus of resistance. At Syntagma Square protestors engaged in a “radical politics of space”, meaning the production of alternative forms of public space in order to transform existing social relations. However, a distinctive feature of these mobilizations has been the active participation of the extreme right at the top of the Square. Throughout the mobilizations, Syntagma Square was divided in two parts (one massive bloc at the top of the square and one massive bloc at the bottom of the square). The people, who participated at the top of the square, were holding Greek flags, articulated strong nationalistic slogans and expressed

their rage against the Memorandum. At the bottom of the square, on the contrary, international solidarity was expressed to social movements, mobilizing against austerity measures. This territorial co-existence of previously fierce political enemies has been remarkable, signifying the emergence of a new political culture. The Left-Right division, which has traditionally dominated the Greek political spectrum, has subsided, while a new binary opposition (Memorandum/Anti-Memorandum) has emerged. This tendency was clearly manifested in the two parliamentary elections that followed (especially concerning young voters). The presentation aims to explore this shift in current Greek political culture as well as the hidden political dynamic in the spatial morphology of recent protest events in Greece.

### **Social Innovation in Housing Policy in Spain**

Liviu Catalin Mara, University of Barcelona | [maraliviucatalin@yahoo.es](mailto:maraliviucatalin@yahoo.es)

The objective of this research is to analyze the process that led to the emergence of a new social movement linked to the problem of housing in Spain. It is currently undergoing a

process of innovation in the field of housing, a process driven by the new social movements. This question arises in a context of economic and financial crisis here in Spain, where

evictions have registered an increase of 134.13% in 2012, which has brought the "consequent creation of a social conflict." (El País, 12/17/2012) This research is based on three main hypothesis. The first hypothesis is that the housing policy in Spain lacks the communicative perspective, in terms of Habermas, in decision-making on housing issues. This lack of dialogue between the policy-makers and the civil society has resulted in the birth of pressure groups within the civil society linked to the housing politics. The second hypothesis is that there have been

successful performances at both national and international level in the fight against homelessness and housing policies that have managed to provide decent housing for all social groups. The third hypothesis is that there are actions, perspectives and elements of these successful policies that could be incorporated in Spain to achieve the purpose of housing rights stipulated in the Constitution. The objective of this work is to demonstrate that innovation in housing policy is driven by civil society, analyzing the activity and functioning of the social groups emerged.

## **From Indignation to Emancipation. A Propose of Analysis of the Indignados' Movement from Below.**

**Tommaso Gravante**, University of Seville | [t.gravante@gmail.com](mailto:t.gravante@gmail.com)

**Alice Poma**, University Pablo de Olavide, Seville | [alicepoma@hotmail.com](mailto:alicepoma@hotmail.com)

**Marco Baudone**, University of Florence | [marco.baudone@stud.unifi.it](mailto:marco.baudone@stud.unifi.it)

The crisis spreading all over Europe, not only economical but also political as for representativeness, has so far caused numerous protests by European citizens. In Spain these protests have found expression in the los indignados movement. In that country, historically characterized by the absence of democratic dialogue between citizens and institutions, the 15M movement represents the emergence of a new political sensibility and, from the common people's point of view, creates a new cronotopos, in other words a new moment and place for engaging in politics. In this paper, by analyzing deep qualitative interviews, we are going to explore how ordinary people, in other words persons without previous political experience, now participating actively in the urban movement, have developed a personal process of

emancipation, transforming themselves into political subjects. The case study that we propose is the local expression of 15M in Seville, the capital of one of the poorest regions of Spain and Europe, Andalusia, and one of the areas most affected by the economic and the social crisis. With regard to the emotional dimension of the protest, we want to show how the persons interviewed deal with the threat deriving from moral shock, identify those responsible and elaborate the injustice frame as well as the process that leads to the transformation of conscience and behaviour, also called the process of cognitive liberation. Finally, we will see how the participation in the social movement has brought about the definition of new values together with a new moral economy alongside capitalist values.

## Resistance to Austerity in Spanish State: Trajectory, Outcomes and Future of M15 Movement

Josep Maria Antentas, Autonomous University of Barcelona | [josepmaria.antentas@uab.cat](mailto:josepmaria.antentas@uab.cat)

The emergence of M15 movement in Spain in 15th May 2011 marked a turning point in Spanish politics. It was the biggest social upsurge since the establishment of the current Regime in 1978 and the beginning of mass resistance to austerity policies after a period in which resistance to social cuts was relatively small although real. It represented a global rejection of austerity policies and of politicians serving to the interests of financial institutions and a massive aspiration to "real democracy" whose emergence couldn't have been explained without the "Arab Spring" and Tahrir Square. Since the first push of May and June 2011 the movement has had a less visible existence, experienced fragmentation and dispersion but not disappeared. Although it has not reached again the peak of May-June 2011 the upsurge of May 15th represented the beginning of a new political cycle in the

Spanish state and changed the ideological, cultural and political landscape. The movement although very diverse expressed a vague "antisystemic" consciousness targeting financial powers and political institutions. The overall dynamic of resistance to austerity since May 15th has been very defensive, with few political and concrete victories, but with elements of counter-offensive and capability of disruption. Two years later the explosion of May 15th the policies that lead to rebellion have sharpened while in the same time the erosion of all the political architecture built in 1978 has also deepened. The economic and social crisis has turned also into a political one affecting the main pillars of the State and the mainstream party system. The rise of M15 expresses a mass reaction against austerity policies that shaken all society structures in a context

## Contemporary Citizens' Protests: A Manifestation of the Transition of Radical Societal Critique into the Middle of Society

Claudia Dorothea Schuetz, Leopold-Franzens University, Innsbruck | [claudia.schuetz@uibk.ac.at](mailto:claudia.schuetz@uibk.ac.at)

In Stuttgart, Germany, middle-class citizens are protesting enduringly against the traffic project "Stuttgart 21" (S21). The movement, often solely designated as a citizens' initiative, is featured by two exceptionalities. Firstly, its critique exceeds criticism on regional political decisions only. In fact, the movement became a vehicle for a broad critique of the political and economical system. Secondly, the protest is partly sustained by a new mobilized middle-class with politically central to conservative orientation. Due to these features, the movement against S21 constitutes a novelty in the history of social movements as it is neither a citizens' initiative nor a social movement as such. The paper argues that a shift of a radical

societal critique from left-wing positions into the middle of society serves as basis for the rise of a new type of protest movements. It states that this shift of critique derives from an expanding societal discontent of contemporary neoliberal political and economical processes that enter also conservative parts of society. Empirically, the paper is based on a qualitative survey on the new middle-class protest group in the movement against S21. Here, the focus is on the process of micromobilization of the protesters on basis of an action-oriented approach. As a result, the paper exposes that contemporary social movements emerging on grounds of specific occasions carry a enormously broad critique of societal

conditions as a whole. It reveals that the awakening of discontent middle-class citizens

plays a crucial role in new patterns of mobilization.

## **07RN25 - A Global Dissenting Youth? Session Two: Student Movements and Youth Activism, anti-Austerity and anti-Corporate Mobilisations**

Chair(s): Lorenzo Zamponi, Joseba Fernández González

### **The Politics of “Precarity” and “Precarization” in the Context of Contemporary Global Youth Activism**

Leticia A. Paulos, University of Ottawa | [lpaul042@uottawa.ca](mailto:lpaul042@uottawa.ca)

At the analytical core of this presentation are three concepts articulated by North American feminist philosopher Judith Butler: the concept of “precariousness” which characterizes the bodily vulnerability of every human being; of “precarity” that characterizes all modes of political and social interdependency and of “precarization”, as the contemporary neoliberal social and economic reality that “acclimatize populations over time to insecurity and hopelessness”. According to Butler, when people “amass” on the streets, it is because they understand their situation as a shared one. But what it is exactly that is shared, what is it that is commonly perceived as a shared experience? By drawing on

examples from two empirical cases, the Occupy Wall Street movement in the United States and the 2012 Quebec Students’ Protests in Canada, I will focus on the issue of students’ loans and tuition fees’ hikes to understand how the perception of a commonality of experience could be grounded in precarity (and its tactical distribution) and precarization. I will conclude by arguing that both the perception of an “unequal” distribution of precarity and the exacerbation of processes of precarization allow us to capture a possible Ariadne’s thread that connects a number of radically different and apparently disconnected social movements.

### **Austerity Protests and (New) Class Politics: Expressions of Middle Class Radicalism?**

Dora Fonseca , University of Coimbra | [dorajfonseca@gmail.com](mailto:dorajfonseca@gmail.com)

An acute crisis is shaking the European Union. Austerity imperatives are asphyxiating entire societies and fostering dynamics of downgrading social mobility. National states are obliged to comply with external directives on economic and social fields and politics is being transformed into technocrats’ issues, more and more out of citizens’ reach. The welfare state tradition is being put at stake, and deregulation, precarity and social

exclusion are the most common effects of the imposition of a “new order” with severe consequences. Since the first trimester of 2011, Portugal has been stage of mass mobilizations and other episodes of collective action under the sign of indignation. These correspond to civil society’s responses triggered by the imposition of the societies of austerity. Despite it can be said that these mobilizations are all-encompassing in what

concerns their nature, when talking about their activists' base we should be more careful. It is within the new middle classes that protest and indignation are more prone to rise. The new sectors of precarious workers and unemployed highly qualified are fighting against a system that frustrates their perspectives of stabilization in a middle class life pattern and display acute dissatisfaction towards political

parties and the system of representative democracy. Therefore, the aim of this work is to establish to what extent we could be talking about expressions of middle classes radicalism (F. Parkin) and new middle class politics (A. Scott, R. Inglehart, K. Eder), embedded in the framework of new social movements (A. Touraine, C. Offe).

## **Students against the Crisis: Antecedents of the anti-Austerity Mobilisations in the Italian Schools and Universities**

**Lorenzo Zamponi**, European University Institute, Florence | [lorenzo.zamponi@eui.eu](mailto:lorenzo.zamponi@eui.eu)

The current cycle of global contention needs to be conceptualised as an articulated set of different phenomena, each one strongly connected to its own political, cultural and social context. Nevertheless, different episodes of mobilisation of the last few years share some common traits, in particular for what the most relevant European cases are concerned. In the last two years, anti-austerity mobilisations were central in shaping the public debate in many European countries, developing an articulated discourse on European policies, financial capitalism and the role of political elites in implementing the neo-liberal agenda. In some cases, like Greece, the anti-austerity movement came right after a relevant wave of student mobilisation. In others, like Italy and the UK, strong student mobilisations were instrumental in building a widespread anti-austerity discourse but they

did not merge into a general anti-austerity movement. In others, like Spain, student groups contributed to the start of the anti-austerity movement, that were also partially built on pre-existing social networks generated in the anti-Bolonia wave of student mobilisation. In any case, the wave of student mobilisation against the corporatisation of education and knowledge and the increasing precarity of work, was the immediate antecedent of the anti-austerity protest. In this paper, based on critical discourse analysis of media content and on interviews to student activists, I analyse the Italian student mobilisation between 2008 and 2011 as an antecedent of the anti-austerity mobilisation, aiming at identifying continuities and legacies in terms of discourse, practices and repertoires of contention.

## **08RN25 - Social Movements and Climate Change**

### **Impacts of Environmental Activists on Climate Policy and Practice**

**Eugene Nulman**, University of Kent | [e.nulman@kent.ac.uk](mailto:e.nulman@kent.ac.uk)

In the 21st century the UK has passed groundbreaking climate change legislation and made unilateral steps to mitigate climate

change. At the same time, environmentalists have made large efforts to push for greater and greater commitments. It is without a doubt

that the environmental movement has contributed to these policies but the extent to which environmentalists have played a role has been under scrutiny. My analysis looks at case studies regarding the policy impact of climate change activism in the UK. While the area of social movement outcomes is under-

researched and increasingly looking at generalizability but often missing the important mechanisms through which policy impacts actually occur, my analysis uses mixed methods to understand the process of social movement outcomes particularly regarding major climate change policies.

## Environmental Justice in the European Arctic?

**Helge Hiram Jensen**, European University Institute, Florence | [helge.jensen@eui.eu](mailto:helge.jensen@eui.eu)

This is a study on some possible ways whereby social movements may participate in the making and maintenance of geopolitical orders. The making and maintenance of political order is a classic issue for political science. When state sovereignty was the prevailing international norm, political scientists applied methodological nationalism and statism to trace and compare processes of state formation. However, the impact of environmental movements, decolonizing movements and financial capitalism have led to a fundamental transformation of international norms. Capitalist market regulation, bilateral agreements for environmental protection and indigenous human rights now constitute a new

field of normative contention for multilevel politics. This condition can be seen as a reflexion of actual ecological, cultural and economic complexity. My study exemplifies such transformations, by investigating the struggle for environmental justice in an indigenous homeland in the sub-arctic fringe of Europe. This vulnerable ecosystem is the homeland of the EU's only indigenous people, according to UN norms. I will present one historical and one ethnographic case study from the ongoing decolonization process, and discuss the theoretical implication for environmental justice struggles in environments that can be characterized as complex political ecologies.

## Climate Change and Local Environmental Activism: From Protest to Practical Action?

**Christopher Rootes**, University of Kent | [c.a.rootes@kent.ac.uk](mailto:c.a.rootes@kent.ac.uk)

As power is increasingly removed from local to national and global arenas, local environmental activists struggle both to secure local redress of their grievances and to place their concerns on supra-local agendas. Yet some succeed in doing so. In order to elucidate the conditions that facilitate such successes, campaigns in England concerning three issues – road-building, waste incineration and airport expansion – are examined. In each, local campaigners at least briefly achieved national attention. Local campaigns were most likely to succeed in elevating their concerns to the status of national issues where they framed

those concerns as translocal issues by networking with others with similar grievances. They were most likely to do this with the assistance of non-local actors such as national environmental NGOs, assistance that was most often provided where the issue concerned a problematic government policy, and was sustained only so long as that issue was nationally salient and consistent with the campaign priorities of those organisations. The emergence of climate change as the most prominent and compelling environmental issue of our time and as the 'master frame' for much environmental action has had varying impacts

upon local environmental campaigns and NGOs. Most local activism on climate change is positive, practical action rather than protest, and this raises questions about the future

shape of environmental activism and of the status of environmentalism as a social movement.

## Framing Risk as Injustice

Renata C. Motta, Freie University, Berlin | [renata.motta@fu-berlin.de](mailto:renata.motta@fu-berlin.de)

The introduction of biotechnology in agriculture dates to mid-90s. In these almost two decades, the technology has been object of ongoing controversies, nationally and internationally. The technology is claimed both as a solution and a threat to the most pressing global environmental issues such food security, climate change and the loss of biodiversity. Far from taking place on a vacuum, the disputes take place in an issue that has been disciplined by multilateral rules with a strong science-based approach. Talking about risks to health and environment becomes crucial in the politics of signification regarding genetically modified crops. This paper looks at the the framing activities of social movement actors in the campaigns against agrobiotechnology in Argentina and Brazil. The purpose is to investigate how they handle risk discourse in collective action

frames. One of the main components of collective action frames is injustice (Gamson 2002). The fact that the discursive opportunity structure favours risk claims does not imply that these are framed in terms of injustice. Moreover, collective action frames serve for mobilization and contention by performing what Snow and Benford (1988, 1992, 2000) identified as "core framing tasks": diagnostic framing, prognostic framing and motivational framing. Based on the empirical material, risk discourse is analysed in its argumentative structure in order to evaluate how social movements define the risks of GM crops as injustice, identify problems to health and environment attributed to the technology and the targets of blame; propose solutions and allocate responsibility for corrective action; and employ risk as a rationale for engaging in collective action.

## 09RN25 - Integrating Perspectives on Radicalization

Chair(s): Christopher Daase (Goethe Universitaet, Frankfurt), Nicole Deitelhoff (Goethe Universitaet, Frankfurt)

## EU Constitutionalism and Societal Constitutional Claims: A Political Sociological Approach to Constitutional Politics

Paul Blokker, University of Trento | [paulus.blokker@unitn.it](mailto:paulus.blokker@unitn.it)

The original constitutional moment of the early 2000s has faltered not least due to a popular rejection of the European Draft Constitution in the referenda held in France and the Netherlands in 2005. While much investigation

has gone into reasons behind rejection and the wider adverse (political) climate that informed the rejection, there is little sociological analysis available regarding positive, alternative constitutional projects that are

constructed by transnational movements. The paper will discuss constitution-making in the EU context from a theoretical perspective, contrasting different understandings of the process of constitution-making, the constitutional subjects involved, and the nature of the constitutional 'product' (including legal,

political, societal and democratic understandings of constitutionalism). In a second step, the paper will analyze a number of constitutional claims that have emerged in the transnational public arena, endorsed by transnational pro-democracy movements.

## **The Resurgence of Contention and the Enduring Significance of Labour Militancy: A Long Wave Analysis**

**Magnus Granberg**, Mid Sweden University | [magnus.granberg@miun.se](mailto:magnus.granberg@miun.se)

The paper explores long-term trends in contentious forms of collective action - using quantitative data spanning the period 1919-2011 - with particular interest in events taking place in advanced capitalist societies after the eruption of economic crisis in 2008. An important result is that contention rose sharply in 2010-2011; there has been a resurgence

comparable to the waves of the late 60s including a sharp increase in general strikes. The article explores how labour conflict presently relates to other forms of contentious politics and revisits the literatures on long waves and new social movements. It argues that labour conflict is a space for movement activity with enduring social significance.

## **No Radicalization without Identification. Radicalizing Public Debates on Native Dutch and Moroccan-Dutch Web Forums**

**Jacqueline van Stekelenburg**, VU University, Amsterdam | [j.van.stekelenburg@vu.nl](mailto:j.van.stekelenburg@vu.nl)

**Dirk Oegema**, VU University Amsterdam | [d.oegema@vu.nl](mailto:d.oegema@vu.nl)

**Bert Klandermans**, VU University, Amsterdam | [p.g.klandermans@vu.nl](mailto:p.g.klandermans@vu.nl)

Populist right ideas hovering around anti-immigrant sentiments are on the rise, simultaneously immigrants make themselves increasingly heard. We present a study of polarizing public debates as they develop on the Internet over time. Employing automated content analysis, postings of two opposing Web Forums used by native Dutch and Moroccan-Dutch youngsters are analyzed. The period chosen (2003-2005) encompassed several devastating intergroup incidents: the murder of

Theo van Gogh and the attacks in Madrid and London. To investigate the process of the polarizing debate, we developed an interpretative framework comprised of politicizing and radicalizing collective identity, polarizing social judgments, and intensifying emotions (hate and fear). We show how the debates at the two Web Forums are shaped by the incidents and polarize over time. Radicalizing identities are key in this process: no radicalization without identification!

## 11JS25 - Joint Session Social Movements and Emotion

### Paradoxes of Emotional Evaluation of the Soviet History in Protesting Political Discourse of Modern Russia

Nataliya Grigorievna Repina, Russian State Social University | [repina-nat@mail.ru](mailto:repina-nat@mail.ru)

The political life of modern Russia in recent years has increased markedly. Openly declared themselves the opposition political groups. In the cities there are mass demonstrations and media present stormy political debate, sure to cover topics of the Soviet history, which continue on internet forums. In this paper we intend to explore the theme of paradoxical relation to the Soviet history of politically active social groups and their supporters. First, we will try to analyze arguments, as of those who feel sorry for the lost Soviet past, which they perceive as the cause of the current situation, and of those who hate the Soviet Union and call Russians to repentance to create positive changes. Second, we will focus on the evaluation of these arguments forming the basis of political discourse. In the paper we put

forward the arguments for the following statements: - all the evaluations of the Soviet history, both of those who regret it, and of its violent accusers are paradoxical, contradictory and provoking the fury of political protest; -these paradoxes cause high emotional intensity of discourse and assume the character of acute emotional controversies tending to escalate into a confrontation; - the overwhelming majority of the debating, in spite of their education and professionalism, show polarity of thinking: insisting only on their point of view, and furthermore, the positions and arguments of the opponent are often perceived as a personal insult. On the basis of the key provisions of sociological theory we try to answer the question; what are the reasons of the paradoxes in evaluating the Soviet past?

### Insurgent Youth, Emotions, and Cognitive Development

Hank Johnston, San Diego State University | [Hank.Johnston@sdsu.edu](mailto:Hank.Johnston@sdsu.edu)

Recent uprising in the Arab world were often portrayed as youth revolts. While participation extended far beyond youthful protests as the revolutions spread, it is important for the study of contentious politics to recognize the vanguard role of youth. This paper argues that youthful participation is the "elephant in the room" of collective action studies. It is incorrect to analyze protest participation based on generic models of the social actors that do not take into consideration cognitive development of young men (especially) and women ages 16-22. These are the primary soldiers in the most significant protest

mobilizations and revolutions of the last century, a fact just recently confirmed in Egypt and Tunisia, and last year, in Iran. This paper analyzes the roots of youthful revolt, emphasizing cognitive development in terms of four key elements of cognition regarding protest participation: cognitive triggering, tactical innovation, high-risk behaviors, and cognitive emotionalism. The analysis concludes with a treatment of crucial intergenerational relations in protest mobilization, and how these shape the trajectories of protest.

## Emotions and Movement Identity: Emotional Boundaries in Collective Memories of the Global Justice Movements in Italy, Germany, and Poland

Priska Daphi, Humboldt University of Berlin | [p.daphi@hu-berlin.de](mailto:p.daphi@hu-berlin.de)

Collective memories play a crucial role in social movements' identity. Next to providing a sense of continuity, these narratives draw emotionally loaded boundaries that distinguish the movement from the outside as well as provide internal differentiations. This paper examines the emotions activists of the Global Justice Movements in Italy, Germany, and Poland attach to boundaries drawn in collective memories. Which emotions are attached to internal boundaries, which to external ones? How does this differ across different constellations of the Global Justice Movement in Europe? The analysis draws on 48 narrative interviews conducted with Italian, German, and Polish activists in 2011 and 2012. Italy, Germany, and Poland constitute different

constellations of the movement with respect to actors, repertoires, and size. The analysis shows that a broad range of emotions are linked to boundaries across countries. In particular, it reveals that the relation between emotions attached to internal and external boundaries varies with the degree of movement cohesion. In constellations with a high degree of movement cohesion emotions attached to external boundaries clearly differ from those attached to internal boundaries: feelings such as mistrust and anger are linked to the first, while trust and sympathy predominate in the second. When cohesion is lacking, emotions linked to external and internal boundaries either converge or are reversed.

### a01RN26 - Sociological Approaches to European Welfare States: Welfare Provision and Social Forces (1)

"Chair(s): Bode Ingo

#### Three Directions for Welfare State Today in and outside Europe

Alessandro Sicora, University of Calabria | [alessandro.sicora@unical.it](mailto:alessandro.sicora@unical.it)

Francis Adaikalam, Chennai Loyola University | [v.francis@gmail.com](mailto:v.francis@gmail.com)

Lambert Engelbrecht, Stellenbosch University | [lke@sun.ac.za](mailto:lke@sun.ac.za)

Päivi Marjanen, Laurea University of Applied Sciences | [Paivi.Marjanen@laurea.fi](mailto:Paivi.Marjanen@laurea.fi)

Linda Martin, Coventry University | [hsx185@coventry.ac.uk](mailto:hsx185@coventry.ac.uk)

Irina Pervova, St. Petersburg State University | [pervovai@mail.ru](mailto:pervovai@mail.ru)

Gary Spolander, Coventry University | [aa2912@coventry.ac.uk](mailto:aa2912@coventry.ac.uk)

Marianne Strydom, Stellenbosch University | [mstrydom@sun.ac.za](mailto:mstrydom@sun.ac.za)

Petri Tani, Laurea University of Applied Sciences | [Petri.Tani@laurea.fi](mailto:Petri.Tani@laurea.fi)

Europe has often been cited as the creator of the modern day welfare state. The European experience of this development continues to provide inspiration and ideas to other regions in the world. In analysing the European experience, Titmuss (1974) and Esping-Andersen (1990) provide useful classifications in terms of ideal-typical welfare regimes namely: the social democratic welfare regime in Scandinavia, the Christian democratic welfare regime in continental Europe and the liberal welfare regime in Anglo-Saxon countries (Aspalter 2011). These classifications provide convenient frameworks for describing and understanding the dramatic changes in social policies taking place in Europe and in the rest of the globe as a result of economic crisis and of the impact of neoliberalism on the social and health systems. Comparative analysis of

social policies in EU (Finland, Italy, UK) and non-EU countries (India, Russia, South Africa) suggest three dynamic tendencies in national social policies in relation to the building, defence and transformation of welfare systems. The protection of vulnerable people as well as social and health professions are deeply and diversely influenced by these dynamics. This paper seeks to understand the present by reviewing the challenge through global perspectives, as these perspectives can also facilitate Europe finding new and creative ways to respond to the present macro-economic crisis and its consequences. The research leading to these results has received funding from the People Programme (Marie Curie Actions) of the European Union's Seventh Framework Programme FP7/2007-2013/ under REA grant agreement n° 295203.

## Systematic Campbell Reviews: The Relevance of Evidence for Social Welfare Policy?

Stine T. Luckow, SFI - The Danish National Centre for Social Research | [stl@sfi.dk](mailto:stl@sfi.dk)

Turf Böcker Jakobsen, SFI - The Danish National Centre for Social Research | [tbi@sfi.dk](mailto:tbi@sfi.dk)

Over the past decade, 'evidence' has become a highly influential concept in child protection social work. Due to increased financial pressure in the social welfare sector new ways of measuring and qualifying social interventions have emerged. Efforts to obtain evidence on effective social interventions have placed the randomized controlled trial (RCT) as the 'golden standard' of methodological approaches. Simultaneously, professional networks and organizational bodies such as the Campbell Collaboration have been established with the objective to produce systematic reviews, preferably drawing on RCT-studies. This paper explores the Campbell Collaboration as a knowledge producing and knowledge legitimizing organization that draws on a highly specific understanding of the social world. Using SFI Campbell, the Nordic Regional Campbell Centre, as a case, the

paper discusses 1) the methodological and epistemological premises on which the Campbell review builds, and 2) the degree to which this type of knowledge applies to different levels of social work practice. Drawing on a theoretical framework based in the sociology of knowledge, the paper concludes that until now systematic Campbell reviews have played only a limited role in developing social welfare policy. Results from currently available reviews are partly ambiguous and typically accompanied with a range of restrictions. Further, only some reviews are in tune with Scandinavian welfare policy on a more general level. The paper is based on a qualitative study that involved desk research and an interview study (n=32) with key figures from Danish public administration, various professional bodies, and social research.

## Religious Values and Welfare States Principles

Marie-Helene Martin, University Paris Descartes | [myrihl@gmail.com](mailto:myrihl@gmail.com)

In the context of an understanding of differences between welfare states we suggested the possibility of a diffusion of values from fundamental categories of Christianity to social welfare edification principles notably beveridgians. We pursued a biographical study. It led to underscore the existence of interpersonal and theoretical relations between many Christian movements and social thinkers. Therefore this study focused on normative and social consequences of two Christian categories, Divine Nature and Salvation, through the analysis of their paradigmatic values and concepts. These values combinations observation led to identify several theological trends. They uphold specific conceptions (and practices) of social

structure and charity and could be observed through the whole Christianity and its various churches. Thereafter in an historical perspective we followed the transmigration process of these combinations and conceptions from theology to social thought. Our study demonstrated that this process can be considered as one core source of contemporary welfare states principles (ethical and structural). We observed, notably, the contribution of the non Trinitarian theology and Christian universalism to W.H.Beveridge social thought. This study especially pointed out the beveridgian subordination of the hierarchic Trinitarian family by radical and non Trinitarian values, and the impact of Universalist theology on this author's conception on work and relief.

## **b01RN26 - Sociological Approaches to European Welfare States: Principles and Agency in Contemporary Welfare Provision (2)**

Chair(s): Sandvin Johans Tveit

### **Assessing Welfare Policies Against the Capability Approach: A Sociological Understanding**

**Emilie Rosenstein**, HES-SO // University of Applied Sciences Western Switzerland | [emilie.rosenstein@eesp.ch](mailto:emilie.rosenstein@eesp.ch)

**Jean-Michel Bonvin**, HES-SO // University of Applied Sciences Western Switzerland | [jean-michel.bonvin@eesp.ch](mailto:jean-michel.bonvin@eesp.ch)

Literature has shown that the adoption of active labour market policies has deeply transformed the field of welfare policies and the very sense of social citizenship. Activation and the individualisation of welfare programmes brought new tools and possibilities in terms of social and professional (re)integration. But they also open the way towards selectivity and new contractual obligations imposed on welfare recipients. In this context, the role of sociology is to question the normative foundations of this active turn in order to assess its potential and risks, and more broadly, its appropriateness in struggling against social inequalities. Our objective is to present a sociological reading of the capability approach (CA), developed by Amartya Sen, and its analytical potential in assessing welfare policies. According to Sen, the very aim of public policies should be the equalisation of

people's capabilities, i.e. their real freedom to lead the life they have reason to value. In this contribution, we will present the added value of this analytical framework for a sociological understanding of welfare transformations. Indeed, the CA offers an original way to tackle jointly the issue of empowering people and in the same time, considering their freedom to choose. Questioning the new balance between individual and social responsibility, the CA points out the social consequences of welfare reforms and allows us to draw conclusions that go far beyond the classical analysis focused on welfare systems efficiency. This contribution is based on four European research projects using the CA as theoretical framework: Eurocap (FP5 2002-6); Capright (FP6 2007-10); WorkAble (FP7, 2009-12); and SocIEtY (FP7 2013-16).

### **Citizens' Agency in the Changing Welfare State**

**Janne Autto**, University of Lapland | [janne.autto@ulapland.fi](mailto:janne.autto@ulapland.fi)

Since the construction of the welfare state, political discourses and social policies have offered different social positions for citizens: objects of social emancipation; active and responsible citizens; consumers; and democratic actors. In this last position, they should have an opportunity to participate in the decision-making in questions that concern their everyday life. The social sciences have

studied these positions more as shifts in politics and social policy than as experiences and aspects of the agency of citizens in what is a changing welfare state. Moreover, that research has concentrated on the triumph of certain discourses rather than on situations where different discourses may collide. By drawing on pragmatic sociology and ethnography, this paper speaks for an

approach that focuses on the ways in which citizens meet changing social policy as clients, consumers, users of services, customers, or as participants in public debates. This approach is interested in how citizens approve of, cope with or resist policy changes and what meanings they ascribe to the situations in which they encounter changing policy. The paper argues

that looking at changes in the welfare state through citizens' agency would help to understand how common and often generation-specific understandings of policy objectives and means operate at the grass-roots level in the welfare state, often clashing and leading to unexpected policy outcomes.

## **Intra-State Conflicts, Private Agents, and the Contentious Reconfiguration of Social Citizenship: A Sociological Historical-Institutional Approach to Welfare State Governance**

Asa Maron, Ben-Gurion University | [asamaron@gmail.com](mailto:asamaron@gmail.com)

This paper offers a sociological historical-institutional approach to explore contemporary changes in social governance. During the last decade, governance gained prominence in the lexicon of welfare state scholarship, yet its capacity to provide a conceptual frame for welfare state change remains limited. This paper intends to provide some insights and elucidate possible directions in that vein. While governance reintroduces the focus on "actors" and the interconnectedness of different arenas where such actors engage in the design and implementation of social policies, it is indifferent to the view of the state as a heterogenic bureaucratic field of institutional actors. Institutional actors operate according to different interests and logics, and often struggle to configure different "Patterns of Governance": Institutionalized interrelations between state and non-state organizations and

agents that constitute specific fields of state activity according to specific political rationales. Taking such ongoing intra-state institutional conflicts seriously as the context for changing patterns of governance may shed light on such questions as: Why certain patterns are privileged over others? Why "new" patterns seldom succeed to replace old ones, and are often attached alongside to create layers of governance? What are the consequences of such hybrid governance structures for inter-organizational and inter-personal relations that underpin new "social contracts" in the welfare state? The paper utilizes two cases from the Israeli welfare state to illustrate the approach and its utility: The introduction and implementation of Israel's welfare-to-work program; and the changing regime of services for children and teens at risk.

## **Activating the sick. Changing Relations of Work and Health in Norwegian Social Policy**

Anniken Hagelund, Institute for Social Research, Oslo | [ahl@socialresearch.no](mailto:ahl@socialresearch.no)

Claimants of health related insurances have become prime targets for activation policies in Norway. Although the country's employment rates are generally high, a comparatively large proportion of its working age population receives a health related type of social

insurance. The paper first outlines the spectre of policy changes that have taken place over the past two decades which have worked to make health related social insurances more active. These include activity requirements, compulsory dialogue meetings, individual

plans, work ability assessments and more. Second, an analysis of discursive change is done by investigating how definitions of health and sickness and formulations of the relationship between health and work have evolved over time. Key policy documents, as well as parliamentary and media debates make up the data for this analysis. The case is used to open up a theoretical and conceptual discussion of the turn to activation in sickness- and disability insurance. In particular it is

argued that the reconceptualization of health and work that is observed in the policy discourse should direct sociological attention to how such ideas work as elements of new technologies of government. An important aspect of this is to analyse how state power operates through engaging wide networks of actors (employers, employees, insurance claimants, physicians) in practices of self-surveillance and self-regulation.

## **c01RN26 - Sociological Approaches to European Welfare States: The evolving quality of welfare systems (3)**

Chair(s): Tonkens Eveline

### **Network Governance and Programme Steering – Practical Applications and Tensions in Planning Child and Youth Welfare Policies**

Mirja T Määttä, University of Eastern Finland | [mirja.maatta@uef.fi](mailto:mirja.maatta@uef.fi)

Kai Eriksson, University of Helsinki | [kai.eriksson@helsinki.fi](mailto:kai.eriksson@helsinki.fi)

Complex social problems are often targeted in public policies in a form of policy programmes, formed by different stakeholders. The aim of networked co-planning is to improve the applicability, effectiveness and legitimacy of policy programmes, and strengthen these as steering mechanisms. Programme planning is also seen as practical tools for implementing network governance and horizontal coordination. In the paper we argue that network governance and programme steering are partly in contradiction and tension to each other. The programme steering stresses governmental power, centralized top down-steering even if it would be implemented by using network governance ideals. Open network governance, in turn, seeks for more

equal negotiations and citizen participation. We explore these two governing mechanisms, programme steering and network governance, and their interrelationship in the Finnish child and youth policy formation. The empirical data consists of two studies, carried out during 2008–2010: the first is comprised of group interviews of officials who took part in planning municipal policies, and the other is an e-mail enquiry for the ministries, expert organizations, NGOs and other actors who gave their written statements for the draft of national policy programme. We ask, to what extend this strengthening circle of programme steering and network governance is possible to attain in practice, and what are the difficulties in it?

## Social Capital and Functioning of Welfare Systems

Paola Di Nicola, University of Verona | [paola.dinicola@univr.it](mailto:paola.dinicola@univr.it)

Object of this paper is a reflection on the role that social capital can play in the processes of innovation and reform of the welfare system. The analysis is based on the following assumptions: 1. global society requires higher levels of trust, but has no systems involving unfair sentencing of ; 2. the processes of individualization require high levels of social capital, but are not able to regenerate it; 3. growing inequality, together with the reduction of the redistributive welfare systems, not only makes people 'less equal', but also less 'trusty'. The complex society requires a lot of capital at macro and micro level, but does not seem able to produce it. In the analysis of the welfare system, social capital is inserted as a new intervening variable that, depending on the perspective, it is considered as a condition for the proper functioning of the system or as a

result of its proper functioning. The capital may be defined as a set of resources (material and non-material) embedded in the structure of relationships of trust and solidarity. In relation to the functioning of the welfare system, social capital, from a macro perspective, it can be identified with forms of action structures of civil society; from the standpoint of micro, as structures of interpersonal relationships (networks) based on trust and solidarity. To examine the role that social capital can play in the reform of the welfare system, it is necessary to overcome the dichotomies of micro-and macro, cause and effect, and consider the welfare state as an institution that incorporates within it the function of production and consumption of the social capital.

## The Nordic Welfare Model in the 21st Century: an Exclusionary Success Story?

Mi Ah Schoyen, NOVA Norwegian Social Research, Oslo | [miah.schoyen@nova.no](mailto:miah.schoyen@nova.no)

Bjorn Hvinden, NOVA Norwegian Social Research, Oslo | [bjorn.hvinden@nova.no](mailto:bjorn.hvinden@nova.no)

Rune Halvorsen, NOVA Norwegian Social Research, Oslo | [rune.halvorsen@nova.no](mailto:rune.halvorsen@nova.no)

The Nordic countries are admired for high employment rates, low levels of poverty and inequality, encompassing welfare states, and peaceful industrial relations. However, the model is often assumed to disadvantage groups, whose work capacity employers perceive as uncertain (e.g. persons with disabilities). The literature identifies at least three exclusionary mechanisms: Compressed wage structures imply that wages are comparatively high at the lower end of the income distribution and there are few working poor. However, employers are reluctant to hire certain workers for fear that their productivity is too low to meet the associated costs. Second, generous benefits affect labour supply by reducing individual work incentives. Third, to meet international competition, businesses

specialise in advanced activities that demand high-skilled workers. We explore these arguments by examining how the Nordic countries perform with regard to employment of persons with disabilities and non-Western immigrants – two groups who generally face a higher than average risk of exclusion – compared with other rich democracies that take other approaches to social protection and have more unequal income distributions. We rely on international (Eurostat, OECD) and national data. While we do not expect the Nordic countries to perform systematically worse than other 'varieties of capitalism,' recent Nordic research suggests that there is considerable internal variation which calls for an explanation. We close with a discussion of alternative explanations for cross-country

variation in inclusion of vulnerable groups. The study contributes to knowledge of which

policies might facilitate inclusion of persons at the margins of modern labour markets.

## Social Quality and Economic Recession

**Claire Wallace**, University of Aberdeen | [claire.wallace@abdn.ac.uk](mailto:claire.wallace@abdn.ac.uk)

**Pamela Abbott**, University of Aberdeen | [p.abbott@abdn.ac.uk](mailto:p.abbott@abdn.ac.uk)

Social Quality has been an effective way of looking at the impact of the quality of society on individual life satisfaction by considering four aspects: socio-economic security, social cohesion, social inclusion and social empowerment. Our previous work has shown that whilst similar factors affect Social Quality across Europe, there are also variations

between European societies. In this paper we look at the 2011 European Quality of Life Survey, which enables us to consider the impact of recession on life satisfaction and Social Quality. Our hypothesis would be that life satisfaction has declined in response to economic recession, but preliminary findings suggest that this is not necessarily the case.

## 02RN26 - Crisis and Downscaling in Social Welfare Provision: Impact and Implications

Chair(s): Syltevik Liv

### Portability of Welfare Rights in the New Europe

**Elaine Moriarty**, Trinity college, Dublin | [Elaine.moriarty@tcd.ie](mailto:Elaine.moriarty@tcd.ie)

**James Wickham**, Trinity College, Dublin | [jwickham@tcd.ie](mailto:jwickham@tcd.ie)

**Justyna Salamonska**, Trinity College, Dublin | [salamonj@tcd.ie](mailto:salamonj@tcd.ie)

**Alicja Bobek**, Trinity College, Dublin | [bobeka@tcd.ie](mailto:bobeka@tcd.ie)

This paper examines the issue of the portability of social rights in Europe. In particular it highlights a growing tension between EU directives guaranteeing equal protections between member state nationals, particularly workers and national welfare implementation systems which have engaged in selective 'restriction' policies. We begin the paper by discussing the implications of recent EU accession migrations for national welfare states. Using data from a qualitative panel study of Polish migrant workers in the Irish labour market (first wave 2007 and current, seventh wave 2012/13), we show how Polish nationals have used the social welfare system

in Ireland. The panel study interviews trace changes in migrants' awareness of, and access to, social welfare as the Irish economy moved from boom to crisis in 2008. This raises three key themes: firstly we discuss perceptions of national welfare systems within a European workspace; we highlight the complex and divergent ways in which European nationals are accessing and moving social supports; and we discuss the state's attempts to qualify EU social rights in the light of concerns around 'welfare tourism'. We suggest that the restrictive policies introduced serve to reassert the assumption that people live in one place, accumulating benefits to be drawn down in that

same place in the event of need. However, this does not take account of the new forms of mobility that have been witnessed through the recent EU enlargements. Such challenges will

become more acute with increased migratory patterns involving lifestyle, retirement and youth migrations.

## **Facing the Challenge of Migration: Local Welfare Systems Strategies within a Downscaling Scenario**

**Sandro Busso**, University of Torino | [sandro.busso@unito.it](mailto:sandro.busso@unito.it)

**Enrico Gargiulo**, University of Torino | [enrico.gargiulo@unito.it](mailto:enrico.gargiulo@unito.it)

**Michele Manocchi**, University of Torino | [michele.manocchi@unito.it](mailto:michele.manocchi@unito.it)

The paper examines the strategies adopted by two local welfare systems in Italy (Torino and Cuneo) in meeting the specific needs of a particular target, namely migrants, in a context of shortening of resources. Due to the general downsizing of welfare state, funds for public services specific for migrants are often no longer available. In this situation, lowering the obstacles hindering the migrants' access to the services addressed to the population as a whole becomes crucial. In such a context, the third sector has come to play a crucial role in complementing the services supply. The relevance of the comparison between the two areas is mainly due to the different socio-demographic features and to a remarkable difference in migrants' access to public social

services. The paper analyzes the factors determining such a disparity by focusing on the supply-side of the welfare systems, that is on the structure of the welfare mix. Moving from case observation, we will argue that, apart from the amount of resources available, other factors are relevant in shaping the welfare supply to migrants. In particular we will highlight the relevance of the choice between different kinds of intervention, and the role of the funding system based on the financing of specific projects. Finally, we will sketch two different ideal-typical models of territorial planning, which deeply influence the relation between the actors and the distribution of tasks.

## **Housing Deprivation and Health: A European Comparison**

**Stefan Angel**, Vienna University of Economics and Business | [stefan.angel@wu.ac.at](mailto:stefan.angel@wu.ac.at)

**Benjamin Bittschi**, Vienna University of Economics and Business | [benjamin.bittschi@wu.ac.at](mailto:benjamin.bittschi@wu.ac.at)

Health deprivation due to socioeconomic factors is a particular severe form of social deprivation. Beside the vast literature on the effects of income, education or occupation on health there is less research on the influence of poor housing conditions as a source of health deprivation. However, bad housing is more likely to affect the health of specific groups such as women, children, unemployed or elderly persons, who spent comparatively more time at home. Empirical evidence

scrutinizing the relationship between housing and health in a cross-country comparative manner with panel data is still surprisingly sparse. Thus, our first research question addresses this issue by using EU-SILC panel data from 2005-2008. Fixed effects regression models are estimated to identify causal links of deprived housing conditions on self-reported health. In particular, we test for separate and direct effects of housing deprivation and income (poverty) on health. This allows

assessing the relative importance of housing and income concerning bad health and has implications for designing policies against health deprivation in post-industrial welfare states, f.i. whether to focus on employability ("social investment state") or on public housing. Second, we apply multilevel models in order to assess the influence of different

welfare regimes on effect heterogeneity and on between-country variability of the dependent variable. Preliminary results show that bad housing conditions significantly increase the likelihood of reporting a bad/very bad health status. Around 10% of the variability in the dependent variable can be attributed to country specific factors.

### **Unpacking Culture as Explanatory Factor of Vulnerabilities: Critical Insights from Social Work with Migrants in Italy**

Paolo Boccagni, University of Trento | [paolo.boccagni@unitn.it](mailto:paolo.boccagni@unitn.it)

"Culture" is often invoked among helping professionals, in new immigration countries such as Italy, as a passepartout to make sense of immigrants' over-exposure to vulnerability, even more under circumstances of recession. My paper primarily aims at deconstructing the uses and functions of this category – as a cognitive device, a stereotype, and possibly a practice-based construct – through a documentary analysis of social work with migrants in Italy. Judging from the professional literature and the public stances of the national social worker association, a widespread circulation of anti-discriminatory and positive advocacy principles goes hand-in-hand with often naive and commonsensical understandings of culture, and of migration itself. Second, and consequently, my paper aims to assess the scope for a cultural competence approach to welfare service provision to migrants, in a country – such as

Italy – with a limited background in social work with ethnic minorities. I will then argue for a more reflexive understanding of what a culture-based lens shows, and of what it does hide – including the differential relevance of age, gender, social class, legal status, discrimination and (lack of) informal networks, as sources of vulnerability. Such a recognition seems critical for making helping professions aware of the faceted roots of migrant over-representations among claimants (and sometimes, recipients) of welfare benefits. Importantly, though, the prevalence of culturalist accounts should be framed against a broader scenario – the processes of institutional welfare restructuring which tend to undermine, in Italy and elsewhere, the professional status, legitimacy and effectiveness of street-level social work with migrants.

## Transformations of Mobility and Belonging in Swedish Social Policy

Erica Righard, Malmö University | [erica.righard@mah.se](mailto:erica.righard@mah.se)

The establishment and development of social policy is generally described as a response to the modern project. Whereas the establishment and development of social policy has developed in divergent ways in different nation-states, overall it has developed within a national frame. In the literature the so called “golden age” of western welfare states is even described in terms of national closures. These closures have from the outset been challenged by mobile individuals. Immigration brings in outsiders – should they access national social security schemes? Emigration carries out insiders – should they access national social security schemes from abroad? These are classical who-questions in social policy research, here related to mobility. Ongoing globalization and increased international migration have nurtured this field of inquiry,

sometimes named transnational social policy. This study takes a historical stance on the issue. Under analytical focus is how discourses of mobility and belonging in Swedish social policy have transformed over time. The overall question dealt with is how we can understand Swedish state social responsibility towards transnational populations. More specifically it asks how different understandings of mobility and belonging in Swedish social policy have shaped (i) the access to social security for foreigners in Sweden and (ii) the portability of social security to outside of Sweden for citizens and foreigners. The analysis relies on written documents (statutory investigations, state reports, etc.). The study connects social policy analysis with mobility studies and it brings new insights to our understanding of Swedish social policies.

## Do Experiences of the Economic Crisis increase Popular Support for the Welfare State? Micro-Level Evidence from Western Europe

Patrick Sachweh, Goethe University, Frankfurt | [patrick.sachweh@gmail.com](mailto:patrick.sachweh@gmail.com)

In order to cope with the global financial and economic crisis of 2007-08, governments across Western Europe intervened in the economy and engaged in active crisis management. As a consequence, some scholars have expected public opinion to become more supportive of government intervention in general and social policy in particular. Indeed, research shows that support for the welfare state increases during periods of economic strain. Therefore, I ask whether experiences of the current economic crisis in Western Europe influence citizens' social policy preferences. Different from prior studies that conceptualize the impact of economic conditions on the macro-level, I focus on the micro-level by analyzing which social groups feel most affected by the crisis and how this influences their support for the

welfare state. Using comparative survey data (Eurobarometer 2010), I show that social groups differ in the extent to which feeling personally affected by the crisis increases their social policy preferences. Among traditional welfare state supporters, feeling personally affected by the crisis bolsters the support of blue collar workers while women and the unemployed are supportive even if they do not feel personally affected. By contrast, the social policy preferences of traditional welfare state opponents are strongly conditional upon crisis experiences: small employers and the self-employed are supportive only if they feel personally affected by the crisis, and otherwise still oppose social policy. In the present climate of fiscal austerity, it remains to be seen how stable a basis of welfare state support will be formed by these groups.

### **Immigration as a New Social Risk? Immigrant Integration Policies in Italian Regions**

**Tiziana Caponio**, University of Torino and Collegio Carlo Alberto | [tiziana.caponio@unito.it](mailto:tiziana.caponio@unito.it)

**Francesca Campomori**, University of Venice | [francesca.campomori@unive.it](mailto:francesca.campomori@unive.it)

The literature and research on new social risks and welfare have rarely engaged in the analysis of the risks linked to the condition of immigrant and of the policies dealing with such risks. This paper intends to investigate the relation between immigration and new social risks in the case of Italy, i.e. a country traditionally characterised by a weak and familistic welfare state and by territorially fragmented immigrant integration policies. After the federal reform of 2001, Italian regions have gained greater autonomy in matters of social policy, immigrants' integration included. Through a diachronic analysis of official documents on immigrants' integration approved in the period 2000-2010, in this paper we shall unfold different conceptions of immigration as a new social risk and of migrants social vulnerability in eight regions representative of different areas of the

country: Piedmont, Veneto and Emilia-Romagna in the North, Umbria, Marche and Abruzzo in the Centre, Basilicata and Calabria in the South. The analysis points out how immigrant social vulnerability is constructed accordingly to different geographies of immigrant social inclusion emerging at the intersection of diverging political orientations (more leftwing or rightwing oriented), consolidated welfare systems (more or less generous and responsive towards the emerging of new social risks) and local economic structures (in terms of prevailing sectors of immigrant employment, diffusion of the informal economy etc.). Local conditions play a crucial role in shaping different framings of vulnerability, constraining immigrants' access to welfare provisions and influencing their social position and paths of integration.

### **Active Labour Market Policies for Migrants – Prerequisites for Success on Micro and Macro Level**

**Isabella Skrivanek**, Danube University, Krems | [isabella.skrivanek@donau-uni.ac.at](mailto:isabella.skrivanek@donau-uni.ac.at)

**Anna Faustmann**, Danube University, Krems | [anna.faustmann@donau-uni.ac.at](mailto:anna.faustmann@donau-uni.ac.at)

**Gudrun Biffl**, Danube University, Krems | [gudrun.biffl@donau-uni.ac.at](mailto:gudrun.biffl@donau-uni.ac.at)

**Lydia T Roessl**, Danube University, Krems | [lydia.roessl@donau-uni.ac.at](mailto:lydia.roessl@donau-uni.ac.at)

In times of crisis labour markets come under pressure and the demand for social policy rises. Active labour market policy measures are one instrument among others to (re-)act. This paper focuses on migrants as a vulnerable

group on the Austrian labour market and analyses structural and systematic barriers to their labour market integration. The presented results are based on an empirical analysis of local approaches and innovative practices of

employment and activation policies for those furthest from the labour market. We chose a theoretical model that treats the projects analysed as part of an open system; key variables are organisational structure, persons involved, objectives, financial resources and methods of labour market integration measures. We combined qualitative and quantitative research methods, i.e. semi-structured interviews with participants (65), social workers and project administration (18 interviews, 2 focus groups), 2 focus groups with social partners and policy-makers, comprehensive questionnaire for data on the participants (1795 cases). The analysis

identifies mechanisms in various policy fields that weaken the individuals' labour market position, e.g. regulations on labour market access, outcomes of the educational system, recognition of foreign qualifications. Based on this analysis, 'prerequisites' for successful activation policies and options for change, also in other policy areas, are discussed. That is e.g. coordination of employment and activation policies, integration of all relevant stakeholders, 'diversity-mainstreaming', better inter-linkage of labour market policies with other policy areas. Apart from this, more emphasis should be placed on early prevention measures.

## Transnational Mobility, Vulnerability and Urban Welfare

Sandro Cattacin, University of Geneva | [sandro.cattacin@unige.ch](mailto:sandro.cattacin@unige.ch)

Patricia Naegeli, University of Geneva | [patricia.naegeli@unige.ch](mailto:patricia.naegeli@unige.ch)

In our paper, we seek to address migration as a risk for vulnerability. It is based on 120 qualitative interviews with migrants facing vulnerability in 20 European cities from 10 different countries. The choice of respondents was based on six criteria. We searched documented migrants, who were born in their country of origin (the so called first generation migrants), with an experience of at least five years in the receiving city. Aged from 25 to 50 years old, they have not acquired the nationality of the host country or, if they have, naturalization was really recent. Half of respondents were men, the other were women. Finally, selected respondents were or have been recipient of local welfare measures.

Migration is generally not related to vulnerability but to social mobility and more life chances. Nevertheless, an important percentage of the population having a foreign passport is submitted to the risk of vulnerability and exclusion. The paper will focalise on multiple factors that together are responsible for vulnerability. At the heart of our paper, we will describe concrete experiences of exclusion and the coping strategies developed by migrants, including experiences with the local welfare agencies. In reference to Sen's capabilities scheme, we will point out the strategies that are developed to face vulnerability.

## c03RN26 - Understanding Vulnerabilities in Post-Industrial European Welfare States: Social Exclusion and Social Divisions (3)

Chair(s): Sachweh Patrick

### The Resilience of the Unprotected. Vulnerability as Dimensions of Dissonant Socialisation within Offerings to the Poor

Stefan Selke, Furtwangen University | [ses@hs-furtwangen.de](mailto:ses@hs-furtwangen.de)

The neosocial logic of supply in eroding social states is characterised by the transfer of more and more elements of social services to private suppliers within a poverty economy. These services are themselves vulnerable (because of how they are financed and supported), but vulnerability is itself a contextual condition for the use of soup kitchens, clothing stores, special department stores or food banks/food pantries. On the basis of the results of two research projects concerning food banks/food pantries in Germany, the design of an empirically based classification is presented. It reconstructs the environment within which offers of help to reduce poverty are made use of. This resulted in the identification of two dominant axes that structure the social space (Selke/Maar 2011): On the one hand, the spectrum of vulnerability/resilience at the level of psycho-social characteristics of those

seeking help, and on the other hand the extent of habituation (exclusion, adaptation) at the level of the forms of practice. These dimensions correspond with each other and make clear how baseline vulnerability can, through the effects of context and time, become increased current vulnerability to stigmatizing and lasting social exclusion or self-exclusion (cf. Chambers 1989). Against the background of the capability concept (Volkert 2005) this presentation/paper queries the role and the consequences of vulnerability in dissonant processes of societisation. This draws on empirical partial studies, e.g. on "exhausted families" (Selke 2011) and on the full evaluation of around 120 qualitative interviews (Selke 2013). The paper explains what intermediary function there is for vulnerability in the "unprotected" social spaces of suppl

### Trajectories of Vulnerability in Switzerland

Felix Bühlmann, University of Lausanne | [felix.buehlmann@unil.ch](mailto:felix.buehlmann@unil.ch)

In recent years, an ever larger proportion of the Swiss population faced situations of vulnerability. In the present article we distinguish three forms of vulnerability: a subjective feeling of employment insecurity, precarious employment conditions and exclusion in the form of long-term unemployment, invalidity or social assistance. Against the temptation to study these phenomena separately, we propose to relate them as potentially specific stages of a biographical trajectory. In doing so we are able

to understand these phenomena as related, we are able to see them as social processes and we can understand their historical and generational spread. Based on data from the Swiss Household Panel we mine for specific transitions of the three states, we build a typology of trajectories of vulnerabilisation and investigate the factors that could explain why people pursue a certain trajectory. We find that particularly the subjective employment insecurity has strongly increased between 2000 and 2010 and that currently only a minority of

holds a secure and stable job. This feeling of insecurity is particularly widespread among young men and could be due to the difficult process of labour market entry. A part of the older generations is feeling relatively secure and protected; another goes through a process of irreversible exclusion. Transitions between

different forms of vulnerability are in general rather gradual and not abrupt. But once somebody moves into a situation of unemployment or precariousness it is hardly possible to return to a stable and also "subjectively serene" job.

## Committing to Uncertainty? Explaining Private Pension Decisions in a Post-Industrial Society

Felix Wilke, University of Kassel | [wilke@uni-kassel.de](mailto:wilke@uni-kassel.de)

The international trend towards welfare markets is accompanied by the hope of meeting favored welfare ends by means of private provision. The German Pension reforms mirror this international trend. My contribution will show that the shift towards a post-industrial society with rising shares of private pensions on the one hand and growing uncertainties (both in the realm of labour market and family structures) on the other hand culminates in serious vulnerabilities for society. The shift towards a post-industrial society can be described by different developments like de-standardisation, increasing flexibility and a growing variety of labour markets and family structures (Esping-Andersen 1999). My main thesis is that these new uncertainties have hitherto neglected consequences for private pension decisions: people facing these uncertainties are less

eager to long-term saving commitments. Empirically, I will use Panel data from Germany (GSOEP) and apply longitudinal techniques to unveil the relationship between different dimensions of uncertainty and long-term saving on an individual level. The consequences might be extensive: First, those in highest need for private pensions due to unstable contributions to the public pillar may show the lowest commitment to save for old age because of their high demand for liquidity. Secondly, since provision for old age now is partly becoming the contingent result of different biographical configurations, the economic situation at retirement may in the future be rather diverse, even within social groups with a comparable economic background. Bibliography Esping-Andersen, G. (1999): *Social Foundations of Postindustrial Economies*, Oxford.

## **a04RN26 - Social Policy and Social Welfare: Working for Social Welfare (1)**

Chair(s): Halvorsen Rune

### **Disability, education and employment in Europe**

Ingrid Fylling, University of Nordland | [ify@uin.no](mailto:ify@uin.no)

Enabling people with disabilities to entering the labor market has been an important goal within disability policy in most European Countries, as well as in the EU. However, while people with disabilities represent around one sixth of the overall EU working age population, disabled people are almost twice as likely to be left out of the labor market as non-disabled people. In Norway for instance, the employment rates for people with disability has remained unchanged for the last 10 years, although increased access to employment represents an important political goal. Many argues that the main way of achieve increased employment for people with disabilities is to strengthen their access to education. Studying disability, education and employment in a comparative perspective, however, bears some

significant challenges. The large variation in proportion of people reporting having a disability or a chronic illness, makes it difficult to validate that the category 'people with disability' in fact constitutes the same category and therefore is comparable across countries. In this paper, we meet this challenge by exploring the relationship between education and employment for people with disability in a comparative European perspective, using a model of European Welfare regimes which is based upon clusters of countries with similar proportions of persons with self-reported disability. Using data from the ESS round 5 (2010), we analyse how education level influences the probability for employment for persons with disability in countries classified as different Welfare Regimes.

### **Comparative Study of Multi-Professional Practice in Providing Support for Children in Residential Child Care**

Jolanta Pivoriene, Mykolas Romeris university, Vilnius | [jolantapiv@mruni.eu](mailto:jolantapiv@mruni.eu)

The goal of the presentation is to analyze cross disciplinary cooperation and communication between the welfare and mental health systems in providing support for children in residential care. This is a comparative study between six EU countries (Denmark, Finland, Germany, Lithuania, Scotland, and Spain) based on focus group interviews with professionals working in both systems. Data is analyzed according to model of multi-professional practice description which

concentrates on basic information about the practice, practice implementation (actors, resources, and processes), practice evaluation and further implementation. The relevance of the research could be based on the case of Lithuania. According to the statistical data, 4,119 children lived in child care institutions in the country. Temporary guardianship was established for 1,335 children; permanent – for 2,784 children. Out of them 606 children were with moderate or severe disability. Special

needs have been established to 1,875 children; mental illnesses – 318 children; emotional, behavior and social development disorders – 899 children. 1,412 children with emotional, behavior or social development disorders were in need of medical aid. However, there is no

effective cooperation model in order to provide support for children in residential care. Comparative research data will help to share experience and will serve the development of tools for satisfying children needs and to work for the best interests of children.

## **Front-line Encounters with the Norwegian all- in-all Welfare Bureaucracy – the Relationship between Citizens and the Welfare State**

Liv Johanne Syltevik, University of Bergen | [Liv.Syltevik@sos.uib.no](mailto:Liv.Syltevik@sos.uib.no)

In this paper front-line encounters between citizens contacting the Norwegian all- in- all welfare state bureaucracy (Nav), are used as point of departure for discussing the relationship between citizens and the state. The encounters take place in the context of a highly developed and generous welfare regime, characterized by activation policy and ideas about personal responsibility as well as 'user-involvement'. Old and new welfare dilemmas inherent in the encounters are identified and

discussed. The data used are participant observation in the receptions of three local-Nav offices, interviews with people in contact with welfare bureaucracies and an exploration of the webpages of the welfare organization. Theoretically the discussion is centered on three main perspectives (concepts) on different analytical levels; Goffman's approach to social interaction, street level bureaucracy and active citizenship.

## **b04RN26 - Social Policy and Social Welfare: Third Sector and Social Welfare (2)**

Chair(s): Sandvin Johans Tveit

### **Evaluation in the Third Sector: Linking Accountability and Organizational Learning**

Mónica Lopes, Centre for Social Studies (CES), Faculty of Economics, University of Coimbra | [monica@ces.uc.pt](mailto:monica@ces.uc.pt)

In Portugal, the several actors (public, private profit and nonprofit) involved in the design, implementation and evaluation of social policies and programs/projects, operate in framework of the europeanisation of national structures and multi-level governance. The growing importance of evaluation in the third sector organizations derives from the new challenges they face, and from the effects of its new relationship with the state and other

donors. Evaluation emerges as an essential element in the contracts and corporation between the state and third sector for the implementation of social programs. This paper, which is based in an ongoing research, will provide a mapping of the knowledge production about evaluation in nonprofit organizations, at national and international level, and will present the early empirical results of the study. I will explore the

relationships between the concepts of accountability, learning and culture of evaluation, and discuss the pressures for the development of evaluation processes in nonprofit organizations as well as their specificities and the role that donors play in constructing evaluation processes that

enhance organizational learning. Inherently connected to the control exercised by donors, evaluation is often seen as mere contractual obligation to meet the accountability demands of funders and not as a tool for learning, empowerment and organizational change.

## **A New Spirit in the Third Sector? On the Coordination of Corporate Volunteering Projects**

**Itamar Shachar**, Ghent University | [itamar.shachar@ugent.be](mailto:itamar.shachar@ugent.be)

**Lesley Hustinx**, Ghent University | [lesley.hustinx@ugent.be](mailto:lesley.hustinx@ugent.be)

**Lonneke Roza**, Erasmus University, Rotterdam | [lroza@rsm.nl](mailto:lroza@rsm.nl)

**Lucas C.P.M. Meijs**, Erasmus University, Rotterdam | [lmeys@rsm.nl](mailto:lmeys@rsm.nl)

The relatively recent but increasingly widespread phenomenon of corporate volunteering receives a growing scholarly attention. However, existing studies are mainly conducted in schools of business and nonprofit management, and mostly explore corporate volunteering from the perspective of the corporation and its employees. Our study endeavors to contribute sociological insights on this phenomenon, while expanding its empirical exploration. We conducted 40 semi-structured interviews with professionals from the Dutch and Flemish third sectors, who were engaged in coordinating and implementing corporate volunteering programs. Our sample included senior staff members of nationwide and local NGOs, as well as prominent workers in matchmaking NGOs that coordinate partnerships between companies and NGOs. Our findings suggest that the initiative for a corporate volunteering project usually comes

from the companies or the matchmakers. They expect NGOs to respond positively to their initiatives and to adjust themselves to the unique features of this form of participation, such as its episodic character. These expectations are in line with approaches of 'new managerialism' that were described by Boltanski and Chiappelo as constituting a 'project-oriented' or 'connectionist' justification regime. In this regime, business professionals as well as third sector actors are positively valued if they are able to be flexible and adaptable, to create new contacts quickly and enthusiastically, and to mobilize a network in order to pursue limited in time and target-oriented projects. Corporate volunteering programs are a prominent channel through which this normative grammar is being diffused from the corporate world to the third sector.

## **The Shift from Professionals to Volunteers in Care and Welfare: a European Comparison**

**Evelien Tonkens**, University of Amsterdam | [e.h.tonkens@uva.nl](mailto:e.h.tonkens@uva.nl)

Welfare states today are under pressure to reform. Reforms tend to be inspired by a mixture of financial and ideological arguments.

Financially, the welfare state is supposed to be in need of serious cut backs in order to be sustainable. Ideologically, it is argued that the

welfare state needs to be more activating, in line with dominant ideal of active citizenship. Citizens should become more responsible for their own health and wellbeing. A prominent aspect this reform is a shift from professional (social or care) workers to volunteers in social service provision. Services that used to be provided exclusively or mostly by professionals, are now increasingly expected to be (co)provided by volunteers. With this trend we witness the rise of a new citizenship regime that is in marked contrast with the idea of citizenship as famously propagated by Marshall in 1949. In this paper, this contrast is

elaborated in order to better understand today's shift and its implications for sociological analysis of the socio-cultural foundations of the welfare state. This trend from professionals to volunteers can be observed in most developed welfare states, but there are major differences in the framing of this trend and its practical elaboration. In this paper, I additionally compare the framing and elaboration of this shift in policy texts from five European countries: The Netherlands, United Kingdom, Sweden, Italy and Germany, and their varying deviations from Marshals' notion of social citizenship in the welfare state.

## **c04RN26 - Social Policy and Social Welfare: Activation and Basic Income (3)**

Chair(s): Sandvin Johans Tveit

### **The New Need's Oriented Minimum Income in Austria – Impact of Reform**

Heinz Leitgöb Leitgöb, University of Linz | [heinz.leitgoeb@jku.at](mailto:heinz.leitgoeb@jku.at)

Bettina Leibetseder, University of Linz | [bettina.leibetseder@jku.at](mailto:bettina.leibetseder@jku.at)

Carina Altreiter, University of Linz | [carina.altreiter@jku.at](mailto:carina.altreiter@jku.at)

The guiding principle for action in public administration arises from the corresponding laws, statutory orders, and provisions, restricting the officials' scope to actions with an explicit legal foundation based on equal treatment. However, a considerable discretion exists at the street level. The new Austrian social assistance ought to foster territorial cohesion of the nine provincial social assistance regulations and increase accessibility to the benefit. In a comparative study on the implementation of the new act in two out of nine provinces, we conducted a quantitative enquiry of 1,000 recipients in the new scheme and all district administrations and guided interviews of administration officials and social assistance recipients in eight districts. We adopt a methodological

triangulation strategy and rely on latent class analysis (LCA) concerning the statistical data and categorization of the eight in-depth case studies leading to a typology. First results vastly indicate an overlap between those two approaches. The distinction between the districts and provinces is caused by two factors: (i) the granting of the benefit, rather restrictive or according to administrative standards, valuing and judging of the individual recipient according to administrator's norm of deserving/undeserving or working within the legal definitions and their deservingness criteria, and (ii) the demands on behavioural change and conditions thereof applied, from low demands to a highly intrusive system either through disciplinary measures or social work.

## On the Blurring Responsibility in Welfare Encounters: Activation, Accountability and Individual Agency

Kjetil G. Lundberg, Uni Research | [kjetil.lundberg@uni.no](mailto:kjetil.lundberg@uni.no)

Throughout Europe, organisational reforms in welfare administrations are implemented in order to intensify activation policy. Service providers are governed in order to better accountability of their tasks, and claimants are expected to become “responsible citizens”. Although aimed at solving classical problems within bureaucracy and welfare, these reforms may produce blurring boundaries of

responsibility in the relationship between claimants/users and service providers. Using the Norwegian labour and welfare reform (Nav reform) as a case, this article analyse users’ attempt to hold the Nav organisation accountable within this new “governance of activation” regime. The analysis points to the importance of understanding individual agency within its situated and structuring contexts.

## Social Consequences of Age-Related Unemployment Policies

Jean-Pierre Tabin, University of Applied Sciences and Arts Western Switzerland and LIVES | [jean-pierre.tabin@eesp.ch](mailto:jean-pierre.tabin@eesp.ch)

Anne Perriard, University of Lausanne | [anne.perriard@eesp.ch](mailto:anne.perriard@eesp.ch)

Unemployment policies provide a large range of benefits defined according to age intervals based on three positions considered as successive regarding employment: entry into the labour force, employment and retirement. The standard position by which these benefits are defined is the one relative to employment. Particular benefits are developed for the other two positions: specific insertion measures coupled with a decreased financial compensation are offered for the “young” category and other measures coupled with longer-term financial compensation are offered to the “senior” category. Specific benefits are also provided to unemployed individuals becoming parents, mainly solo mothers taking care of small children. This not

only shows the gender-specific difficulty to combine the status of employee and caregiver, but it also reveals that this position almost exclusively concerns solo mothers. In this communication, we assume that age is a social relationship because it reproduces hierarchies « in the distribution of power, authority and money» (Calasanti, 2003, p. 205). We will show that, by naturalizing age, the social policies (re)produce social hierarchies based on age and gender. The empirical data used for this communication are drawn from a current research within the National Research Pole LIVES: (IP 5, Overcoming vulnerability to unemployment: possibilities and limits of the active social and labour market policies).

## The Longer, the Lesser? On the Relation between the Duration of Benefit Reciprocity and Material Living Conditions among Recipients of Means Tested Benefits in Germany

**Bernhard Christoph**, Institute for Employment Research (IAB), Nuremberg |

[bernhard.christoph@iab.de](mailto:bernhard.christoph@iab.de)

**Torsten Lietzmann**, Institute for Employment Research (IAB), Nuremberg |

[torsten.lietzmann@iab.de](mailto:torsten.lietzmann@iab.de)

Among the core goals of means tested benefits is safeguarding recipients, once in need, against a further erosion of living conditions and thus to protect them against falling below a (legally defined) minimum standard of living. However, there is not much knowledge on how living conditions of recipients of such means tested benefits actually develop during times of relying on benefit payments. Instead, when analyzing temporal aspects of material living conditions, the focus is usually on entering or leaving life situations like for example times of income poverty or periods during which one has to rely on means tested benefits. An aspect which has up until now been given much less attention is the potential correlation between the length of time people remain on means tested benefits and their material situation. Throughout this paper we will argue, that this

is mainly due to methodological reasons, since income measures, which are the most common indicator of material living standard, will be more or less predetermined by legal regulations when receiving benefits. Thus, unless legally relevant changes – as e.g. in household-composition – occur, income should remain stable. On the other hand, when applying an alternative measure, like e.g. a deprivation index, we should be able to identify changes in living standard of recipients that might occur over time. Indeed, following this approach we are able to show for Germany, that households receiving means tested benefits (the so-called Unemployment Benefit II) for a longer period of time also face higher material deprivation, even though their income does (as expected) not differ significantly from that of short(er)-term recipients.

## RN27 - Regional Network on Southern European Societies

### 01RN27 - Human Mobility and Social Change

Chair(s): Daniel Bertaux, Andrea Vargiu

#### The Breakdown of Normality and the Practice of Citizenship: Negotiation, Resistance and Exit

Evangelia Tastsoglou, Saint Mary's University | [evie.tastsoglou@gmail.com](mailto:evie.tastsoglou@gmail.com)

Maria Kontos, Goethe-University, Frankfurt | [Kontos@soz.uni-frankfurt.de](mailto:Kontos@soz.uni-frankfurt.de)

The present paper explores coping strategies under conditions of deep socio-economic crisis. Through the discourse analysis of a detailed online exchange among readers of the broad circulation centrist newspaper Kathimerini in Greece, we chart the resilience, agency and resistance of Greek citizens in the context of the present socio-economic crisis. Online fora can be considered as part of the emerging electronic public space with much easier participation access for citizens than what the public space of the traditional communication media such as print media, radio and television offer. From this point of view, the analysis of the online fora enables us to develop a deep insight on the discursive construction of the crisis and the social responses to this reality. At the same time, the citizens' ongoing and passionate dialogue analyzing the crisis, negotiating social justice

issues, proposing resistance, and even thinking through and planning exit strategies are manifestations of a strong citizenship practice which has the potential of transforming the political and social landscape with repercussions well beyond Greece. In the context of this dialogue, migration comes up early and is extensively discussed in practical and moral terms as a "way out" of the crisis. Alternative strategies of survival under the conditions of a breakdown of normality are also being debated. Migration has been a well-trodden, historic path as a strategy to restore biographical continuity outside of Greece. Interestingly, this option is recast here in a way that defies the individual versus collective dualism: it is proposed as a strategy for the individual to be able to assist others and for the common good.

## Economic Crisis and Geographical Mobility from Urban to Rural Areas: the Case of Greece

Eleni Nina-Pazarzi, University of Piraeus | [enina04@yahoo.gr](mailto:enina04@yahoo.gr)

Savvas Katsikides, University of Cyprus | [savvask@ucy.ac.cy](mailto:savvask@ucy.ac.cy)

The recent economic crisis has affected differently urban and rural areas in many aspects of life and there is mobility from urban, mainly metropolitan, to rural areas observed in Southern European Societies. Until recently, before the beginning of the economic crisis, in 2008, the movement of the young generation from rural to urban areas was the rule. Leaving the metropolitan areas is a challenge

not only for individuals but also for social change in these areas. This paper will present the findings of a qualitative research conducted in Greece concerning the recent mobility of people from metropolitan areas to rural areas. A comparative research project on this topic for southern European societies is of interest and a challenge for sociologists nowadays.

## An Ethnic Urban Map: Bologna and its Habesha Coordinates

Inês Vieira, Universidade Nova de Lisboa | [ines.vieira@fcsh.unl.pt](mailto:ines.vieira@fcsh.unl.pt)

Bologna is a medium Italian city, the capital of the Emilia Romagna region. It is a significant context in regard to mobilities in Italy: an ancient but young city, culturally and economically vibrant, with a major percent of academic people with temporary residence and a population growth due almost entirely to immigration. In this scenery, we propose to explore the Bolognese map on its habesha coordinates, identifying places and moments of experience, memory and identity for the Ethiopian and Eritrean immigrants in Bologna. How can we draw an ethnic map over the general urban tissue of this city? How to integrate and understand the social life of this Bolognese immigrant community? An attempt will be made to present a map that recognizes different uses and approaches to the city, subtitling the specificities of an ethnic-based experience of Bologna. This reflection might be

integrated in the more general studies of post-migratory population dynamics, particularly when considering the different phases of migration and settlement on an urban and human ecology perspective. This work emerges from the empirical stage with the Ethiopian and Eritrean community in Bologna, from May to August 2012, consisting in the participant observation (on the daily spaces and some significant events) and the conduction of semi-structured interviews (in audio and video, resulting in a short documentary film with Akio Takemoto and Enrico Turci: "Bello essere Habesha"). This work makes part of the PhD project in human ecology, which aims to explore the migratory paths from African countries under water stress (Ethiopia-Eritrea; Cape Verde) to Southern European countries (Italy; Portugal).

## Human Mobility and Social Challenges in Southern European Societies

Rina M Contini, University of Chieti-Pescara | [rm.contini@unich.it](mailto:rm.contini@unich.it)

In the paper I suggest a reflection on the changes of Southern European societies, caused by the movement of people and by the progressive multiculturalism of contemporary societies. Such a theme is framed within the wider context of globalization processes, of the widening of the European Union, of the presence on the territory of the Union of people and citizens originally immigrated. In the paper I also analyze the question of: citizenship; the right to be educated and the interventions that allow the full implementation of such a right; belonging; and social cohesion. The experience of citizenship and its formal asset have undergone changes: a pluralization of ways of citizenship, due to the coexistence of different citizenships within the same territory, together with a multiplicity of its expression in individual

[micro] and social [macro] expression is outlined. Citizenship is deeply linked to the dimension of individual rights and freedom, but also to the importance of processes of recognition of full dignity of everybody and the right to difference and diversity (Kymlicka, 1995; Cesareo, 2004; Benhabib, 2005; Bloemraad, 2006; Nesse Network, 2008; Council of Europe, 2008). I have investigated this theme through the analysis of the experience of a sample of over 1300 Italian and non Italian preadolescents attending first degree secondary schools in Abruzzo, that is to say an area that is still little studied but recently has known a significant increase in foreign students and therefore is characterized with a multi-ethnic and pluricultural aspect.

## 03RN27 - Territories and Sustainability

Chair(s): Eleni Nina-Pazarzi, Arturo Rodriguez Morato

### Social Sustainability of the New Agricultural Production Enclaves: The Case of the Region of Murcia, Spain

Héctor Romero, University of Murcia | [hromero@um.es](mailto:hromero@um.es)

Antonio J. Ramírez, University of Murcia | [gastoni@linuxmail.org](mailto:gastoni@linuxmail.org)

Marta Latorre, University of Murcia | [mlatorre@um.es](mailto:mlatorre@um.es)

Germán Carrillo, University of Murcia | [gcarrillo@um.es](mailto:gcarrillo@um.es)

This paper presents some provisional findings of an empirical research on the social consequences that new forms of intensive agricultural production generate in some rural areas in Spain and Mexico. It is argued that these enclaves cause problems of social sustainability which are different than those that have traditionally affected rural areas. Local specificities of these rural areas are connected with common global trends, which

enable comparison between areas of different regions. The hypothesis is that the problems of social sustainability of rural areas are modulated differently in each territory. This paper aims to show some findings on major social sustainability problems such as demographic imbalances in the gender and age structure, barriers to social integration due to the development of a new logic of social polarization and the emergence of vulnerable

groups whose capacity for satisfaction of material and symbolic needs is severely restricted. The methodology of this research is based on the combined use of quantitative techniques, such as reviewing data (demographic, economic and labor) and secondary (union documents, reports of

business organizations ...) sources, and qualitative techniques, such as observation of forms of work organization and the organization of daily life, family life and social life, interviews to strategic informants as union and business organizations representatives, as well as workers.

## Cement, Progress and its Effects in Valencia (Spain)

Mercedes Martinez-Iglesias, University of Valencia | [mercedes.martinez@uv.es](mailto:mercedes.martinez@uv.es)

Is presented some facts and makes a few comments on the social and environmental effects produced on the Spanish Mediterranean coast by the predominance of the construction sector in the last phase of economic growth. It's focused primarily on the País Valenciano (or the Valencian Autonomous Community consisting of the provinces of Alicante, Valencia and Castellón), although due to contextualize the analysis, it includes some data that refer to the whole of Spain or other autonomous communities. The duration of the study is focused on the period of expansion initiated in half of the last decade of the previous century and the outbreak of the current crisis has brutally interrupted. The importance of construction in Valencian and Spanish economies has been very visible since

at least the 1960s, but has increased dramatically in the last phase of growth: the path followed by the consumption of cement in Spain illustrates it's synthetic and very clear. In just two decades, the construction has more than doubled its relative weight in the gross added value in Valencia. Construction has acquired an enormous prominence in the economy, in work and in Valencian politics. A productive system that had become diverse and complex has been transformed into a kind of real-estate monoculture, with significant costs such as the destruction of landscapes and the disruption of living conditions. The analysis will try to explore the interrelations between the dynamics of the housing sector, environmental impacts, consumer practices and changes in lifestyles.

## The Social Conditions of Territorial Development: a Comparison between Sardinia and Sicily

Fiorella Vinci, University of Palermo | [fiorella.vinci@tiscali.it](mailto:fiorella.vinci@tiscali.it)

The social conditions of territorial development: a comparison between Sardinia and Sicily Parsons's theories of modernization (Parsons 1966; Bendix 1967; Goldthorpe 1971) had a dual analytical ambition: to propose a historical-comparative interpretation of the social development and to highlight the causal link between cultural and structural factors (Chazel 1974). The successive transformations of the original theories - while focusing on the economic political and cultural factors of the development, (Dore 1987; Evans e Stephens

1988; Eisenstadt 1990) - not always have fueled the original analytical ambition. Through which social mechanisms do the individual cognitive and normative bents promote the economic and social development of the different Regions? Identifying the distinctive features of sociology of public action and reflecting on the different public-private partnerships (Duran 1998) activated in implementation of the cohesion policies in two Regions of southern Italy: Sicily and Sardinia, we highlight different logics of cooperation (Cersosimo 2001; 2004)

based on the transformation of individual utilities in forms of political solidarity in Sardinia and on instrumental negotiations between individual and public utilities in Sicily. Is it possible - as the comparison of two case studies has disclosed - that processes of

individualization based on the juridical and moral internalizations of the individuality constitute the collective roots of the different cooperative logics? And if so, which social mechanisms promote the juridical moral internalizations of the individuality?

## Vivre en régions de faible densité : est-ce un handicap ?

Ana Romão, Military Academy, Amadora | [anaromao74@gmail.com](mailto:anaromao74@gmail.com)

Au Portugal, depuis les années 1960, tandis que la concentration urbaine s'est accentuée surtout dans le littoral, de larges parties du territoire poursuivent une trajectoire de dépeuplement associée à de fortes pertes de l'économie de l'agriculture et à l'absence d'autres alternatives génératrices d'emploi. L'Alentejo, région du sud du pays, est une des zones plus touchées par ce processus. Par le passé, l'idée de « grand désert », fut souvent évoqué à propos de cette région, par référence à son paysage, mais surtout en considérant tous les handicaps sociaux et économiques dont elle a hérité au long des années. En une quarantaine d'années, Alentejo a connu une succession de changements parfois radicaux. D'abord, en résultat de la révolution d'avril 1974, l'expérience de collectivisation des terres, qui fût intense, mais éphémère. Après la réforme agraire, on a assisté à la dévolution

des terres aux anciens propriétaires et à l'imposition des impératifs de la PAC et la montée de l'émigration a accentué le déclin démographique et économique. Pourtant, les valeurs patrimoniales (matérielles et immatérielles) que la région a su conserver lui accordent de nos jours un fort capital d'attraction, qui se reflète notamment dans l'accroissement des activités touristiques et de la demande de résidences secondaires. Malgré la crise, en 2010 le taux d'investissement a supplanté celui du pays, et la SAU a augmenté (modérément). Dans cette communication il s'agira de répertorier les changements survenus dans cette région dans la période récente, avec particulière attention aux conditions de vie de ses habitants, en comparaison avec l'ensemble du Portugal et d'autres régions « périphériques » et délaissées de l'Europe du Sud.

## 04RN27 - Urban Renewal

Chair(s): Luís Vicente Baptista, Giovanni Bechelloni

### Private Economic Interests in Urban Regeneration: new Shapes of Coalitions and Strategies

Avolio Claudia, IUAV, University of Venice | [claudia.avolio@gmail.com](mailto:claudia.avolio@gmail.com)

The paper will focus on the rising role that the private economic actors - and the different shapes that could assume their organizations - are having in the urban renewal processes. Because of the diffusion of public and private partnerships, required by the decrease of public financial resources and also promoted by EU policy, to facilitate urban development process, the involvement of private actors goes beyond the policy arena. More specifically, they are taking part in several policy phases assuming different weight and responsibility: from the definition of the technical features of the projects to their concrete implementation. In respect of such changes two of the main risks are: the inability of public institutions to

drive the policy processes and the erosion of their capability to protect public goods and social rights. This risk is more serious especially for those urban areas whose administrations don't have a clear development strategy. That is in several cases of southern Italy cities. The case study I will present is the east urban area of Naples that is the former industrial area of the city. Its relevance depends on the fact that in the east area is going to realize one of the largest urban regeneration interventions at European level for the extension of the area interested and for the portion of private investment. The empirical research has been conducted following a qualitative approach.

### Mobilizing against Urban Renewal Policies: Madrid and Ankara Cases

hayriye Ozen, Atilim University | [hozen@atilim.edu.tr](mailto:hozen@atilim.edu.tr)

Savas Zafer Sahin, Atilim University | [zsahin@atilim.edu.tr](mailto:zsahin@atilim.edu.tr)

Urban renewal policies, which are developed to change or transform a whole urban area or a part of it, may lead to the emergence of different forms of grassroots mobilizations. This study focuses upon two different forms of local movements that emerged in Madrid and in Ankara in relation to urban transformation projects in these cities. While the mobilization in San Cristobal neighborhood of Madrid emerged by demanding from the state to start a transformation project in their neighborhood, the mobilization in Dikmen valley in Ankara emerged by opposing to the terms and

conditions of the urban transformation projects that were imposed upon them by the state agencies. Drawing on insights from both social movements and urban movements literatures, and adopting the "paired-comparison" method, the study comparatively examines how and to what extent these mobilizations in two different locales with distinct political structure and culture have influenced urban renewal policies and related projects of local states. The findings indicate that although two local movements have become considerably successful in terms of producing effects on the

related urban projects in line with their demands, they have not achieved definite victories mainly due to the neo-liberal logic

that has been shaping the policies of both the Spanish and the Turkish states not only at the national but also at the local levels.

## **A Seaside Urban Continuum: from the Beach of Faro to Falesia**

**Joao Carlos Martins**, New University of Lisbon | [joaomartins.cf@fcsh.unl.pt](mailto:joaomartins.cf@fcsh.unl.pt)

The Algarve's integration as a Seaside Leisure Territory under the Mediterranean Sun and Sea Tourism market and imaginary (William, 2000) started in the 1960s; promoted by the national state with the Regional Plan of Algarve (1963-66), a strong emphasis on the creation of spaces as tourism commodities (Fainstein, 2005) and by private investors on hospitality and Leisure Real Estate (Brito, 2010). We present some case studies under a seaside polycentric territory among the cities of Faro, Loule and Albufeira which suffered a profound process of Touristification (Knafou, 1996) and Tourism Urbanization (Mullins, 1991), which developed a strong economic and social dependence around the tourism system (capital reproduction, job creation, mobility, amusement and accommodation of travelers). The first uses of the beaches of Faro and

Quarteira as bathing areas in the 1930's, implied the implantation of the first Leisure related accommodations, an economic appropriation made by local fishermen, still today strongly related to national tourists. The increase on foreigner travelers and residents started after the airport inauguration (1965) and some important high class residential and leisure infrastructures were developed like Vale do Lobo (1963), Quinta do Lago (1971) and Vilamoura (1964), creating new urban areas on a dispersive distribution between the waterfront and the urban borders of the National Road 125, an important mobility infrastructure and urban corridor (Ascher 1995). The different tourism approaches and the urban results on these different social morphologies will be helpful to understand the process undergone.

## **05RN27 - Values, Politics and Violence in Southern European Societies**

Chair(s): Roberto Cipriani

### **Forgiveness, Reconciliation and Implacability in Narratives of Survivors after the War in Bosnia and Herzegovina**

**Goran Basic**, Lund University | [goran.basic@soc.lu.se](mailto:goran.basic@soc.lu.se)

In this article I analyze verbally portrayed experiences of 27 survivors from the 90's war in Bosnia and Herzegovina. One aim of the article is to analyze markers for reconciliation and implacability, the second is to describe the terms for reconciliation which are actualized in those stories. The interactive dynamics, which occurred during the war, make the post-war

reconciliation wartime associated. Narratives about reconciliation, implacability and terms for reconciliation, are not only formed in relation to the war as a whole but also in relation to one's own and others' persons wartime actions. The narratives about reconciliation become an arena in which we and them are played against each other in

different ways – not least by rejecting the others acts during the war. In the interviewees stories implacability is predominant but reconciliation is presented as a possibility if certain conditions are met. These conditions

are, for instance, justice for war victims, perpetrators' recognition of crime and perpetrators' emotional commitment (for example the display of remorse and shame).

## **The Brigade Rosse Case (1969-2002): the Choice of a Violent Strategy against the Italian Society**

**Emanuele Ragusi**, Sapienza University of Rome | [emanuele.ragusi@uniroma1.it](mailto:emanuele.ragusi@uniroma1.it)

**Francesca Greco**, Sapienza University of Rome | [francesca.greco@uniroma1.it](mailto:francesca.greco@uniroma1.it)

In a previous study, a quantitative methodology of text analysis performed on Brigade Rosse (BR) announcements produced between 1969-78 was tested. It highlighted interesting results in line with other studies performed with other methodologies, showing the evolution of the culture of the BR. Due to the small amount of studies performed on BR announcements in the period following 1978, this study explores the culture emerging from the BR announcements produced between 1979-2002 and compares it with the results of the previous study. To this aim, BR announcements (n=36) were collected and underwent a statistical analysis carried out with a computer software package (T-Lab), which performs a factorial analysis to identify clusters of words significantly associated with each other ( $p < 0.001$ ) which were related to

specific guerrilla groups (PCC and Historical). Results show a significant change compared to those obtained from the previous analysis, highlighting new objectives, functions and roles attribution. The class struggle seems to be the main objective of their strategies. While the Historical group focus mostly on the need to release proletarian prisoners to carry out the attack at the heart of the State, the PCC focus mostly on the role of political and economic institutions hindering the achievement of social equality according to communist ideology. While the group's clandestine nature in the first decade seems to imply a detachment from reality, in the second period it does not seem to affect their perception of reality which instead remains extremely concrete.

## **Examining Honor Perception in Urban and Rural Areas: A study in Bolu, TURKEY**

**Veysel Mehmet Elgin**, Abant Izzet Baysal University, Bolu | [veyselmehmetelgin@yahoo.com](mailto:veyselmehmetelgin@yahoo.com)

**Zuhal Guler**, Abant Izzet Baysal University, Bolu | [zuhalguler69@hotmail.com](mailto:zuhalguler69@hotmail.com)

**Derya Cirakoglu**, Abant Izzet Baysal University, Bolu | [deryam102@hotmail.com](mailto:deryam102@hotmail.com)

Honor is a fundamental concept in the Mediterranean region, which was originally studied by anthropologists (e.g., Herzfeld, 1980; Peristiany, 1965, Pitt-Rivers, 1977). Given the social norms of the society, the concept of honor represents the reputation of a person on the eyes of his/her own, and on the eyes of his/her in-group (e.g., family, kin, society),

which one does not hesitate to protect it at all costs (Pitt-Rivers, 1977). The preliminary research of the focus group study conducted with university students in Turkey revealed the significance of honor in Turkey (Elgin, 2012). As a more comprehensive qualitative research, it is planned to be conducted a semi-structured in-depth interview for examining how honor is

perceived in rural and urban areas in Turkey, and the socio-economic and socio-cultural elements affecting this perception. This study is planned to be conducted in Bolu province which is located between the two biggest metropolises in Turkey (i.e., Istanbul and Ankara), but which also possess a sort of closed structure. The sample will be chosen from

three different SES (i.e., high, middle, low) from both rural and urban areas of Bolu province. Given the significance of the topic, it is believed that the findings of the study will have important contributions for the both Turkish literature and Southern European literature.

## Religion and Politics among the Portuguese; Values, Practices and Perceptions

**Manuel Carlos F Silva** , University of Minho | [mcsilva2008@gmail.com](mailto:mcsilva2008@gmail.com)

**Fernando B. Ribeiro**, University of Trás-os-Montes e Alto Douro | [fbessa@utad.pt](mailto:fbessa@utad.pt)

It is often said that, facing the process of secularization, people will no longer engage in religious activities and, on the other hand, faced with the crisis of the political system, the mistrust of the partygoing professional politicians and of their partisan politics. The aim of this communication is to test and evaluate these assertions based on empirical data collected, by the purpose of an investigation focused on gender equalities, the application of 800 enquiries in Continental Portugal. The questions refer to a brief evaluation about the various perspectives on religion and, above all, to the need to examine the relationship of religion, either with values, either with the politics. Considering such variables as gender, profession, age, were placed and examined various issues such as the type of professed religion or belief (or none) and their differentiated practices by

gender and profession, the level of compliance and confidence, also by profession and gender, parties to defend their interests or solve problems. The data collected confirm that the great majority of the Portuguese people is Catholic, distributed the remaining for other religions or simply are agnostics or atheists. However, in terms of regular religious practices, as well as the rate of non-practitioners to be higher than that of the practitioners, practicing rates are differentiated by occupational groups and higher among women than among men. In terms of perceptions vis-à-vis the parties as regards the protection of their interests and solving, respondents show, in relative terms, a greater reliance on non-partisan entities (unions, civic movements, religious centers and associations) than in political parties.

## 06RN27 - Inequalities, Solidarities and Participation in Southern European Societies

Chair(s): Ana Romao, Laura Alipranti

### Youth Political Culture in Portugal: Attitudes, Engagement and Participation

Tiago Carvalho, CIES-IUL, Lisbon | [tiagomlcarvalho@gmail.com](mailto:tiagomlcarvalho@gmail.com)

Nuno Almeida Alves, Lisbon University Institute | [nalmeidaalves@iscte.pt](mailto:nalmeidaalves@iscte.pt)

Ana Alexandre, CIES-IUL, Lisbon | [ana.alexandre@sapo.pt](mailto:ana.alexandre@sapo.pt)

David Cairns, CIES-IUL, Lisbon | [dc\\_cairns@hotmail.com](mailto:dc_cairns@hotmail.com)

This paper provides insight into the present condition of youth political culture in Portugal at a time of economic crisis and growing labour market marginalisation. Evidence consists of survey data, interviews and focus groups conducted as part of the European Commission funded MYPLACE (Memory, Youth, Political Legacy and Civic Engagement) study during 2012 and 2013 in two socio-economically contrasting locations in the Lisbon Metropolitan Area. Using these accounts, we are able to illustrate youth political culture

along three specific dimensions: (1) attitudes towards society and political systems; (2) the extent of political and civic engagement; (3) perceptions of relationships between politics and democracy. Our results look at both the range of attitudes and engagement, examining possible reasons for both engagement and disengagement with political culture, and how such participation might feed emerging forms of political culture, both democratic and non-democratic alike.

### The Long Road from Periphery to Convergence: Social Mobility in Southern Europe Countries

Ildefonso Marqués-Perales, University of Seville | [imarques@us.es](mailto:imarques@us.es)

Manuel J. Herrera-Usagre, University of Seville | [manuelhusagre@gmail.com](mailto:manuelhusagre@gmail.com)

Carlos J. Gil, University of Seville | [carjgil@gmail.com](mailto:carjgil@gmail.com)

José M. Echavarren, University of Pablo de Olavide, Seville | [jmechavarren@upo.es](mailto:jmechavarren@upo.es)

Until the advent of the economic crisis of 2008, Southern European Countries were taken as successful models of the difficult path that leads from underdevelopment to modernization. Greece, Italy, Portugal and, above all, Spain were thought that they could serve other nations, especially those in Eastern Europe and Latin America, as an example of peaceful, gradual and effective political transitions. Nonetheless, this convergence may not have accomplished with its duty of

social integration and equal opportunities between social classes. In the present paper we will analyze: 1) To what extent those countries have reached the intergenerational social mobility rates of core European countries such as Germany, France, England or Sweden among others. 2) We will test whether Southern European Countries share a common social mobility pattern (internal homogeneity) between them as well as a different social mobility pattern comparing the

other European countries (external heterogeneity). UNIDIFF, Constant Social Fluidity, Core Social Fluidity and Quasi-Equal Row and Column Effects II (QERC-II) will be

used as indexes of intergenerational social mobility patterns. We will use the European Union Survey of Incomes and Living Conditions (EU-SILC) with data from 2005 to 2011.

## Political Aesthetics: Perception of Territories and Arts

Cédric Masse, University of Lisbon | [masse.cedric@gmail.com](mailto:masse.cedric@gmail.com)

Social movements re-actualise the subversive power of art that is fundamentally a challenge to the status quo. Indeed, esthetical values and art under different modalities occupy a core place in the militant praxis. Theatrical performances, mises-en-scènes, dancing, music, songs, paintings, sculptures and so on appear during public demonstrations or when activists appropriate and reshape through them the public space and urban territories. Beyond appearances, illusion and *illusio* (the play), there exists an artistic truth, which is intimately related to the cognitive praxis insofar as it participates in the production of knowledge made by the activists. Urban territories occupied and transformed through their arts by social movements are converted into public spheres, places wherein epistemic discourses, “communicative reason” and “ideal speech situations” (Habermas) take shape.

There, through their interactions, people come to publicly, rationally and critically discuss about issues concerning the public realm; they use their reason for political matters and change. In other words, within the polis and outside the private sphere, the political life occurs in the agora. Activists therefore put forward a veritable political aesthetics that entails both a knowledge based on the spatio-temporal perception of urban territories and arts. These are the aspects I am going to explore in my paper from the current Portuguese situation in a context of crisis. However, following one of the fundamental Durkheimian methodological precepts, it will also be comparative; in a diachronic way by referring to several historical instances and in a synchronic fashion by considering different geographical contexts, notably Spain.

## Changing Social Classes: a Multi-Scaling Comparison of Portugal, Southern Europe and the European Union

Rosário Mauritti, ISCTE-IUL, Lisbon | [rosario.mauritti@iscte.pt](mailto:rosario.mauritti@iscte.pt)

Nuno Nunes, ISCTE-IUL, Lisbon | [nuno.nunes@iscte.pt](mailto:nuno.nunes@iscte.pt)

Susana da Cruz Martins, ISCTE-IUL, Lisbon | [susana.martins@iscte.pt](mailto:susana.martins@iscte.pt)

António Firmino da Costa, ISCTE-IUL, Lisbon | [antonio.costa@iscte.pt](mailto:antonio.costa@iscte.pt)

This proposal is based on an analysis of the processes of structural reconfiguration in Portugal since its formal inclusion within the European Community (1986) to the present day, from a perspective that emphasizes the relative positioning of the country in southern Europe and in the European Union as a whole. Through a multi-scaling and diachronic

analysis of socio-occupational and educational configurations, by exploring indicators of official statistical sources in Europe (OECD and Eurostat), we highlight some of the major manifestations of contemporary social inequality, living conditions, insertion in the labour market and well-being. The presentation aims to respond to the needs of

renovated frameworks, both theoretical and substantive, in order to make new contributions to the definition of classificatory typologies and indicators that may allow for a more complex and comprehensive understanding of the phenomena in question. The main indicators are related to economic activity, employment, occupations and qualifications, and individuals conditions of access to resources and life opportunities. This presentation offers a set of contributions to the analysis of class structures and processes of

recomposition currently crossing the countries of southern Europe, with a particular emphasis on the situation of the Portuguese society in this context and comparing with EU patterns. Some of the results will emphasize main trends, concerning the growing importance of qualifications and their reflex on inequalities in access to opportunities and social rewards; and simultaneously the increasing tendency for dilution of stable employment ties, even in the most qualified segments.

## 07RN27 - Bello Essere Habesha (documentary)

Chair(s): Romão, Ana (Military Academy), Vargiu, Andrea (University of Sassari)

### Bello Essere Habesha

Inês Vieira, Universidade Nova de Lisboa | [ines.vieira@fcsh.unl.pt](mailto:ines.vieira@fcsh.unl.pt)

Akio Takemoto, Compagnia teatrale Semi-Cattivi | [takemoto.akio@gmail.com](mailto:takemoto.akio@gmail.com)

Enrico Turci, Compagnia teatrale Semi-Cattivi | [nrc.turci@gmail.com](mailto:nrc.turci@gmail.com)

"Bello Essere Habesha" is an independent documentary film shot in the summer of 2012, reflecting how we met the Eritrean and Ethiopian people living in Bologna, Italy (duration: 31 minutes; original languages: Italian, English, Amharic; subtitles: English, Italian, Portuguese; script: Inês Vieira, Akio Takemoto & Enrico Turci; cinematography, sound, editing: Akio Takemoto & Enrico Turci; production, research: Inês Vieira; original music by Gokali Trio: Gonçalo Mortágua, Katerina L'Dokova & Jorge Oliveira). It resulted from an observing participation, letting people tell their stories and histories and suggesting

some tips for sharing memories and thoughts. What is the human face of the post-colonial relationship between Italy, Ethiopia and Eritrea? How distant are these countries' living realities? Who are these Habesha migrants, why did they come and stay in Italy? We propose to sit, walk, party, share, eat, listen and talk - live - with this community for a while. This session has been organized by the RN27 coordinators. We will first watch the documentary film about migration in Italy, which has been a result of an observing participation conducted by Inês Vieira. All three authors will participate in the discussion.

## RN28 - Society and Sports

### 01\_23JS28JS33 - Sports, Gender and Sexualities (1)

Chair(s): Oktay Aktan (University of Dortmund), Michael Meuser (University of Dortmund), Alessandro Porrovecchio (University of the Littoral Opal Coast)

#### Reconstruction of Gender in Sports Context

Oktay Aktan, University of Dortmund | [oktay.aktan@tu-dortmund.de](mailto:oktay.aktan@tu-dortmund.de)

Diana Lengersdorf, Technical University of Dortmund | [diana.lengersdorf@tu-dortmund.de](mailto:diana.lengersdorf@tu-dortmund.de)

The meaning of gender in sports studies is a major theme in social sciences. Next to the technical aspects of sports, the team formations and selection processes for the collective sports practice is a question of gender as well. The aim of the presentation is to introduce the theoretical frame of gender and sports studies with the aim of discussing the reflections of gender based interrelations in sports. The main question is whether gender in its combination with sports contribute to re-definition and/or (re)perception of "gender". Another point of interest is to examine to which extent the competition among the athletes can re-constitute the male and female identities in

sports context. The presentation includes an overview of some research approaches in studying not only gender but also other dimensions of social inequality i.e. ethnicity, milieu, social class or religion in sports. The primary focus is to reconstruct the categories and dimensions of social inequality in their interwoven form. The individual and the collective self-presentation forms, perception patterns and their relations with gender are some other phenomena in this area of research. The impact of these social constructions on everyday life relations and the staging attitudes will be investigated profoundly in the presentation as well.

#### Beautifully Violent: The Gender Dynamic of Karate

Chloe Maclean, University of Edinburgh | [s0822532@sms.ed.ac.uk](mailto:s0822532@sms.ed.ac.uk)

If sport is a domain used to construct and reproduce hegemonic masculinity (Connell, 1990), and violence particularly is constructed as an inherent 'duty' of masculinity (Bourdieu, 2001:53), then how do women place themselves within the mixed-sex training environment of karate? Through a combination of semi-structured interviews and observations, this study explores the gender relations in Scottish karate, and how they both reproduce, and challenge, established ideas of gender. Karate is a sport societally understood

to embody characteristics of conventional masculinity, but where men and women train and contend with one-another for sporting capital. Based on conceptions of the body, men are assumed a more 'natural' fit to karate and afforded higher status than women. Yet within the mixed-sex training environment, men and women learn a mutual respect for one another as training partners who can improve one another. In this environment, karate is a sport where women can, and often do, outperform men, and in doing so, reconstruct notions of

femininity, and the gender order. As such, karate does not simply reproduce hegemonic masculinity. Rather, the tension between karate athletes learnt understanding of women karate athletes as strong fighters, combined

with societal interpretations of women as weak, fragile, and aesthetically pleasing, constructs a gender arrangement where women are both subordinated and empowered simultaneously.

## Gender in Equitation: "Now Go on and Grab her Really Hard by the Back of her Neck"

Nicole Kirchhoff, Technical University, Dortmund | [nicole.kirchhoff@tu-dortmund.de](mailto:nicole.kirchhoff@tu-dortmund.de)

From a historical perspective, the relationship between man and horse has masculine connotations. This applies both to the domestication of the animal as well as to its use for economic and military purposes and for the staging of male domination. Dressage as a discipline of equestrian sport has its roots in the training of soldiers and horses and up to today employs a language in which domination and annexation of the animal body through the body of the rider are expressed in a sexualized form. This however appears in stark contrast to the current competitive practice, in which there is no separation between the sexes and to the observation that it is dressage of all sports which seems to be a typically female discipline. Starting from body and gender theory based on social constructivism, this

presentation would like to point out, using a single case study on a dressage rider, how the bodies of horse and rider are gendered in sport practice. On the one hand the empirical results refer to the tension between institutional gender equality in competition and to inequalities in the form of traditional language usage at the same time. On the other hand, the experience of one's own body and that of the horse as a "partner in sports" will be examined, focussing on the question how femininity is constructed and performed. Thus, the assumption is taken into account that the social construction of gender always implies a physical dimension, which must quite necessarily be included in sociological analyses.

## Women in Ice

Piroska Béki, Semmelweis University, Budapest | [beki@tf.hu](mailto:beki@tf.hu)

In the past decades women have begun to take up types of physical activity which traditionally used to be considered masculine. They appeared in previously one-gender team sports such as football or water polo, and nowadays they are also involved in ice hockey, canoeing, and are active in numerous combat sports as well. On the other hand, men have also entered sport fields previously only available for women, such as rhythmic gymnastics. By this, sport can be regarded not only as a scene of gender stereotyping, but also that of redefining the concepts of masculinity-femininity in the negotiating of

gender relations. In his theory (1965) Metheny defined the social acceptance or refusal of women in sports on the basis of features like aesthetics, the frequency of physical contact and the level of physical stress, or the weight of equipment used. But have stereotypes related to women in different sports changed by the beginning of the twenty-first century, and if they have, what particular changes can be traced? The presentation aims at introducing current results of a PhD research which examines gender stereotypes related to different sports. Data were collected from female representatives of Olympic sports via

semi-structured interviews. Earlier pairs of sports, one of which was considered feminine and the other masculine were compared (boxing vs RG as examples of individual sports, handball vs volleyball as team sports). This time female ice hockey players' (N=21) and

female figure-skaters' (N=12) opinions on their own sport and the other sport were investigated. We deal with differences in the childhood sport socialization processes and motivation of sport selection, etc. of the representatives of the two sport

## 01RN28 - Critical, Creative and Collaborative Sports Practices

Chair(s): Maddie Breeze (University of Enimburgh)

### Bricks and Bones

Maud C. Hietzge, PH Freiburg | [hietzge@ph-freiburg.de](mailto:hietzge@ph-freiburg.de)

The presentation addresses Parkour activities concerning the motional qualities and the central role of mediatized self-presentation in trend sports. The differences in the varieties of Parkour will be displayed in connection with the notion of 'spacing' (Lefèbvre 1991, Löw 2001). Parkour will be interpreted as a complex bodily strategy in reaction to modern life styles. The incorporation of flexibility (Beck 1986) and the restructuring of the urban environment are intertwined in one and the same complex of activities, representing both, juvenile protest culture (Atkinson 2009) and adaptation to the already existing. Theoretical approaches to new sporting activities will be integrated in the sense that the 'semiotic' characteristics of trendy sport (Schwier 2004, 2008) and the product life cycle (Lamprecht & Stamm 1986) will be put in relation to the presented exemplified video material as a

commitment to further theoretical development. The software Feldpartitur is used to analyse two videos in contrast which can be interpreted as typical for original Parkour and the version Freerunning. The aesthetics of the YouTube videos change with the symbolic quality of the enacted practice in relation to processes of subjectivation. The perspective on the connection of bodily activity with material affordance structures of the environment and the 'situatedness' of movement in and across public territories will be explored (Ameel & Tani 2012). The interrelatedness of motional, interactional and media activity is a 'glocal' one: performed locally, communicated and imitated globally (Bröskamp 2006), it is building up a layer of enacted meta-commentary on urban topography and social spacing.

### 'A Big Sexy Joke': Roller Derby, Ambivalence, Seriousness & Social Change

Maddie Breeze, University of Edinburgh | [maddiebreeze@gmail.com](mailto:maddiebreeze@gmail.com)

Roller derby is a relatively new, women-led, full-contact, roller-sport organized according to do-it-yourself (DIY) principles, situated in ambivalent relation to a broader field of sport. Roller derby is, as yet, comparatively non-institutionalized, non-professionalized and

non-commercialized, and in most journalistic and academic accounts, occupies a position of gendered alterity to 'sport'. Working in a context of existing belonging to complete three years of ethnographic research with a league of approximately 90 members, I conceptualize

roller derby as an instance of 'sport' that is remarkably self-evidently and self-consciously MADE. Skaters' organizational and representational practices are marked by their unmistakable status as a product of human agency and social interaction; roller derby is explicitly self-produced. Accordingly, previous research and skaters alike have described roller derby as a transformational space of possibility, for example, of gender subversion. However, as the league matures and expands, it transgresses familiar trajectories of

organizational solidification and institutionalization, and skaters are increasingly concerned with GETTING TAKEN SERIOUSLY as a REAL SPORT. In this context I examine the relations between 'seriousness' and organizational solidification, and between ambivalence and the possibilities and limits of 'change', at the mezzo level of skaters' organizational and representational praxis, and the degree and nature of any challenge roller derby poses to a broader, gendered, landscape of 'professional sport'.

## Roller Derby and the F-Word – Marketing Feminism, Alternative Femininity or False Consciousness?

Ursula M Burger, Edinburgh Napier University | [40071575@live.napier.ac.uk](mailto:40071575@live.napier.ac.uk)

Roller derby is an emerging female full-contact grassroots sport. It is based on the intricate dynamics of gender, gender identities, punk and alternative subculture, and has a self-sustaining and self-supporting corporate mission – aptly summarised as 'by the skaters, for the skaters'. This paper seeks to explore the linkage between feminism and roller derby as expressed through its marketing activities. Edinburgh's Roller Derby League provides an illustrative case study. The aim is to discover whether roller derby, as a new 'unfeminine' sport, portrays and markets 'genuine' feminism by offering a niche for alternative femininities. At the same time it considers whether roller derby is a site of false consciousness, partaking in what Goldman (1992) termed 'commodity feminism'. Research was undertaken via audience questionnaires, content analysis of advertising, and in-depth interviews with members of Edinburgh's roller

derby league, Auld Reekie Roller Girls (ARRG). Analysis revealed that both skaters and audience are uncertain about whether roller derby constitutes a truly feminist space, or whether it is a just place for alternative femininities. For outsiders, some marketing communications do indeed demonstrate the false consciousness of commodity feminism. However, for the roller derby tribe of ARRG, the message changes: tribe members are familiar with the critical and pejorative discourses surrounding Derby, as well as with the empowerment offered by both liberal and alternative feminisms. In conclusion, ARRG constitutes a non-heteronormative space, where queer and alternative femininities are welcome and equal. Marketing communications are created as gynocentric texts for a predominantly heteronormative audience.

## **“Breakdance – that’s Me!” The Meaning of Breakdance in the Lives of Young People**

**Tonje Fjogstad Langnes**, Norwegian School of Sport Sciences, Oslo | [t.e.f.langnes@nih.no](mailto:t.e.f.langnes@nih.no)

**Kari Fasting**, Norwegian School of Sport Sciences, Oslo | [kari.fasting@nih.no](mailto:kari.fasting@nih.no)

Today the tradition of hip-hop culture and breakdance has evolved from the ghettos of The Bronx, New York in the 1970s, and grown into a worldwide phenomenon. The culture offers young people identification with, and acceptance by, a global society that crosses racial, ethnic and geographical boundaries. In this paper the focus will be on the meaning of breakdance in the lives of young people living in Oslo, Norway. The results are part of a larger Ph.D. study, where the objective is to contribute to increased knowledge and insight into the lives of young people and their construction of identities. The data material is produced by the use of fieldwork (7 months) among young breakdancers in Oslo combined with 17 semi-structured interviews. The interviewees were 6 females and 11 males, all

of them breakdancers, aged between 15-30 years old. Breakdance gathers people with different ethnic backgrounds. Seven of the interviewees belonged to different minority groups, while ten were ethnic Norwegians. The results indicate that multicultural youth have experienced that they connect to themselves and their body through breakdance. They also feel that breakdance empowers them, which can translate to situations outside the dance context. To follow the “passion” for breakdance becomes, for many, a lifestyle and a life altering choice – such as, for example, taking a year off, either from school or work, just to dance. The breakdancers experience identification and belonging in a global society, regardless of the development of a sub-cultural identity.

## **Alternative Youth Sports as Worlds of Interaction and Meanings**

**Anni Rannikko**, University of Eastern Finland | [anni.rannikko@uef.fi](mailto:anni.rannikko@uef.fi)

**Paivi Harinen**, University of Eastern Finland | [paivi.harinen@uef.fi](mailto:paivi.harinen@uef.fi)

**Veli Liikanen**, Mikkeli University of Applied Sciences | [veli.liikanen@mamk.fi](mailto:veli.liikanen@mamk.fi)

Even as adults are worried about young people not exercising sports enough, there are lots of collaborative, self-organized and self-learned forms of sport among the youth. We approach this issue by presenting first findings of an ongoing multidisciplinary research project concerning different alternative sports – such as parkour, roller derby and bouldering – and their meanings. These forms of activity take us away from the traditional venues built for sports to streets, stairways, parking lots and parks. People involved in so called alternative sports do not always perceive their hobby as sport. They rather attach to it such definition as

spontaneity, creative use of space, informality and a tendency to question hierarchies of the community of participants. In this context alternative sports may better be considered youth subculture, which is defined by self-created style with particular code of behaviour and view of life. It is characteristic for alternative sports that they either consciously or unintentionally challenge traditional sports. They aim at differing from institutional organising of sports, sports clubs and competition. Everyone involved in them is a potential developer and creator of new tricks. Moreover, alternative sports constantly find

new forms following the changes of built infrastructure. Therefore the field of alternative sports is dynamic and constantly changing. It is noteworthy that alternative

sports require excellent physical condition and intensive exercise. Therefore they cannot be entirely separated from the definitions and categorisations of sports and sportiveness.

### Homosexual Gendered Body - Perception Inside and Outside the Sport: The Case of Poland.

Honorata Jakubowska, Adam Mickiewicz University, Poznań | [honorata@amu.edu.pl](mailto:honorata@amu.edu.pl)

In my presentation, I would like to discuss the differences in attitudes toward homosexual women and men in sports. I will focus on football – the national sport in Poland – perceived as the last bastion of masculinity. I'm going to take a look at attitudes of both players and coaches as well as sports fans. This subject is interesting because any professional athlete has not revealed his homosexuality in Poland, while some artists (actors or dancers)

as well as politicians have come out in recent years. It is hard to believe that there are no homosexual people in sports, rather this area of social life is perceived as homophobic environment. The fear of coming out, however, what I would like to show, has gender-dependent sources. Finally, I would like to point out some examples of positive changes taking place mainly in amateur sport.

### Tunisian Sportswomen between Modernity and Tradition

Jamoussi Benkhalifa Raja, University of Sfax | [raja\\_isseps@yahoo.fr](mailto:raja_isseps@yahoo.fr)

We have devoted our efforts in this research to provide some answers and offer further insights on the elite sports and on the status of sportswomen. We focus on the evolution of the mindset held by our society towards women in sports. To answer all these questions, we conducted a qualitative survey (31 interviews) and quantitative (412 questionnaires) with athletes (216 women and 216 men) who have earned medals in international competitions in various sports. The comparison between athletes enabled us all along this work to shed some light on convergences and divergences in sports, body and society. Our work shows that laws governing elite sports, sports facilities,

sports education, and scientific supervision have enabled athletes some ascent to the top level. However, social class and the nature of practiced sport played a more important role in the progression towards elitism. Tunisian women increasingly invest in 'high level' sports that are identified to strengthen economic potential, improve living standards, fight against inequalities, and lower poverty. These women engage in non-traditional practices, but they are neither in family conflict nor in rupture with the cultural circle. It seems easier and more acceptable for a girl to practice a «male» sport; nevertheless, there is a restriction on broadcasting the image of these

sportswomen on television. Elite sportswomen still face resistance and social constraints, but their attitude of wanting to change the

stereotypical representations of masculinity and femininity cannot be disputed.

## Extreme Training and Self-Destruction in Mixed Martial Arts

Yann Ramirez, University Paul Valéry Montpellier III | [yann-ramirez@orange.fr](mailto:yann-ramirez@orange.fr)

Mixed Martial Arts (or MMA) is concerned by the sociology of bodily engagement. We can define combat sport like a deliberate destruction. A destruction of the "other", but also a self-destruction. Engagement in boxing and also in Mixed Martial Arts can strengthen social cohesion of young men with deviant behaviour and can break routinization of life and reaffirm masculinity. Body becomes extreme; a machine which moves away from the ideals of health. Competition degrades body. The cult of performance and the pressure of success increase risks. Doping is one of the consequences. The bodily engagement by the abuse of sport could be illustrated by a symbolical reunion between Eros and Thanatos: the fascination of the death danger. Construction and destruction are

mixed up, the risks are glorified and covered by a form of aesthetics. All percussion combat sports are violent, but MMA is not the more brutal one. Meanwhile the athletes fight inside a cage. Open-fingered gloves and strikes on the ground bring out a negative impression and barbarian image. Furthermore, scientific statistics show that MMA is less traumatic than American Football or Rugby. The problem is the visual impression with blood and spectacular minor injuries: cuts on the face, broken bones, dripping blood over bodies and fight shorts. Organization leaders are seriously taking care of competitors. Medical tests take place before the fight with blood test and the funduscopy. After the fight, a check up must define an appropriate medical suspension in case of noticed injury.

### Elite Sports Training as Model for Future Internet Practices?

Magnus Eriksson, The Interactive Institute, Göteborg | [magnuse@tii.se](mailto:magnuse@tii.se)

This paper reflects on the experience of using ethnographic and experimental research at a high-performance athletic training center as model for drawing conclusion about the future everyday use of ICT and Internet technologies. The research project has consisted of field studies of training session and everyday life at an elite training center where athletes live and train as well as experimental design processes where new internet and media technologies has been explored within elite sports training.

While in some aspects the research has been sports specific (such as using advanced video technology to analyze precise movements), in other aspects the training center has seemed like a more intense, extreme and streamlined version of our contemporary technological everyday. The training center has been a laboratory where issues of quantification of self, goal-orientation vs. creativity, and individual vs. community has been displayed in a more clear, isolated and focused way than

observations of everyday life can glean. The conclusion is that studying the intense environments of elite athletes can be a fruitful approach to studying the sociology of Information technology. However, this is only

the case as long as our societies are dominated by the same values as elite sports such as competitiveness, goal-orientation, specialization and efficiency through technology and discipline.

## **Resistance and Co-option in Subcultural Sports : Coaches and Coaching within Snowboarding**

**Anna-Liisa Ojala**, University of Jyväskylä | [ojala.annaliisa@gmail.com](mailto:ojala.annaliisa@gmail.com)

**Intro and purpose** Action sports are interesting counterpoints for do-it-yourself ideologies, subcultural resistance, co-option and commercialization. As action sports have become incorporated into the Olympics, some athletes have hired coaches to help them to be successful. However, there is a lack of studies which examine the role of coaches or coaching within action sport cultures. The aim of the study was to examine how Finnish professional snowboarders give significance to the roles of coaches in their careers. **Methods and Data** The approach was ethnographical. The data included field diary notes and 19 semi-structured interviews with 18 Finnish professional snowboarders and three rookie riders. **Results** The study identified four different categories of how Finnish professional snowboarders interpret the role of coaches in their careers: traditional model

of coaching, indirect model of coaching, the coach as a manager and administrator of resources, and, the ineffective coach. The findings of the study explicated how individuals today (snowboarders in this study) are tied by thousands of hair-thin ties to the sports system; and also sports organizations, such as the Finnish snowboarding Association have to settle for the reality, that people understand themselves as entrepreneurs of their own lives (Siisiäinen, 2007). **References** Siisiäinen, M. (2007) Something Old and Something New: Finnish Voluntary Associations around the Turn of the Millenium. In H. Itkonen, A-K. Salmikangas & E. McEvoy (Eds.), The Changing role of Public, Civic and Private Sectors in Sport Culture. Research Reports No 3/2007. University of Jyväskylä, Department of Sport Sciences, 110-119.

## **Rehabilitation Center is Changing- What about Agency?**

**Arja Piirainen**, University of Jyväskylä | [arja.piirainen@jyu.fi](mailto:arja.piirainen@jyu.fi)

**Pertti Matilainen**, University of Jyväskylä | [pertti.matilainen@jyu.fi](mailto:pertti.matilainen@jyu.fi)

**Hanna Vehmas**, University of Jyväskylä | [hanna.vehmas@jyu.fi](mailto:hanna.vehmas@jyu.fi)

**Mikko Rajaniemi**, University of Jyväskylä | [mikko.rajaniemi@gmail.com](mailto:mikko.rajaniemi@gmail.com)

Aging of the population, outsourcing of services and deterioration of rehabilitation centers will change. Global trends together with the growing impact of leisure in constructing people's life styles and identities have increased the demand for sport and health products. The aim of this study is to

examine the customer profile of the rehabilitation clients in the Rehabilitation Centre. The study is conducted in the Rehabilitation Centre & Spa Hotel Peurunka in Central Finland. The data (n=755) has been collected by using an ethno-survey sampling of the yearly customers of Peurunka. Data was

analysed by SPSS 14. Based on the results, customers were divided to three basic segments according to their main reasons for the travel; 1) Rehabilitation, 2) Sport and leisure and 3) Well-being and ability maintenance at work. Rehabilitation customers were the biggest group (N=313). The results indicate, that sport activities were the most popular activities used during the visit (n=755), but the rehabilitation customers (n=313) had a unique customer profile. Their average age was higher, they had lower health condition and functionality and they also had significant

lower educational level than other customers. In addition their income levels were lower than other customers. However at the same time rehabilitation customers were very pleased with their rehabilitation and also with the rehabilitation staff and their expertise. The study offers interesting results with relation to socio-cultural approach of agency to understand rehabilitation as interaction between person and community. Peurunka resort illustrates the changes and challenges of health and sport services in postindustrial Finland.

## Creating a Physical Activity Index for Adults and Children in the Study Concerning Physical Activity Patterns in Families

Tanja Matarma, University of Turku, Faculty of Medicine | [tamamar@utu.fi](mailto:tamamar@utu.fi)

Physical activity (PA) has proven to have extensive effects on health. When examining children's physical activity patterns, research has shown that parents' physical activity patterns and social support are of importance. The longitudinal STEPS-study (n=1797 families), which is currently running in the University of Turku since the year 2007, aims to search the precursors in child health and well-being. During last five years, the questionnaires sent to families annually have included questions concerning PA, sedentary behaviour and the attitudes towards PA. A sub study has been commenced in the spring 2013 from the material of the STEPS-study. This sub study will focus on the link between physical activity and motor skills of children. From the gathered material so far, there will be created

both physical activity index for adults (PAI-A) and eventually also for children (PAI-C), from which the PAI-A is discussed in this paper. The idea of creating PAI-A is to have criteria for choosing different families (n=150 families) for the sub study based on parents' physical activity patterns and attitudes. Based on the gathered material, PA can be calculated as MET-hours. MET is a metabolic equivalent index for leisure-time PA. MET is calculated from questions concerning weekly time spent on physical exercise, intensity and duration. PAI-A in this study will additionally include commute exercise, recreational sports, sedentary behaviour and attitudes towards the physical exercise of small children. The scoring system is to be developed.

## 03\_05JS28 - The Commercialization of Sport and Fitness (1)

Chair(s): Fabio Lo Verde (University of Palermo)

### Exploring Sport and Physical Activity through Consumption and Self-Image

Miia Grénman, University of Turku | [miia.grenman@utu.fi](mailto:miia.grenman@utu.fi)

Terhi-Anna Wilska, University of Jyväskylä | [terhi-anna.wilska@jyu.fi](mailto:terhi-anna.wilska@jyu.fi)

Drawing on the discussion on commercialization of physical culture, the purpose of this study is to examine how perceptions of consumption and self-image affect engaging in sport and physical activity. Sportive activities are prominent both in media and consumer culture, and they play an important role in individuals' everyday life as everyone is surrounded by the social world of physical culture, its meanings and signals. Sportive activities are practiced in numerous ways and due to various reasons. Also the fundamental aim seems to have changed; they have become commodities of the leisure industry. Broadening the scope of sportive activities with a cultural perspective and analyzing them as a culturally constructed area of life, this study takes a quantitative approach to examining engagement in sport and physical activity. The data consists of a

National Student Health Survey (n=4403) conducted in Finland in 2012. Principal Component analysis with Promax rotation resulted in seven parallel perceptions of consumption and self-image: 1) Happiness and life satisfaction, 2) Media and fashion, 3) Physical activity and healthy lifestyle, 4) Sustainability, 5) Material beauty and aesthetics, 6) Individualism, and 7) Technology and quality. Physical activity and healthy lifestyle seemed to have a stronger correlation with Happiness and life satisfaction than with Media and fashion. Component scores were then analyzed with ANOVA and statistically significant differences in socio-demographics were found. Preliminary results indicate that the features of Happiness and life satisfaction, Media and fashion, and Physical activity and healthy lifestyle scored higher values among younger respondents and females.

### Sport Activities and Health in Tourism – the Case Peurunka in Central Finland

Hanna Vehmas, University of Jyväskylä | [hanna.m.vehmas@jyu.fi](mailto:hanna.m.vehmas@jyu.fi)

Arja Piirainen, University of Jyväskylä | [arja.piirainen@jyu.fi](mailto:arja.piirainen@jyu.fi)

Pertti Matilainen, University of Jyväskylä | [pertti.matilainen@jyu.fi](mailto:pertti.matilainen@jyu.fi)

Sport and health activities comprise significant niche markets of contemporary leisure. Global trends together with the growing impact of leisure in constructing people's life styles and identities have increased the demand for sport and health products also in tourism. Trendiness of active and healthy life style offers possibilities for tourism enterprises. On the other hand, hard competition for customers in economically and structurally

unsteady environments sets challenges for the profitability of the tourism activities. The aim of this study is to examine the significance of sport and health related services as reasons for travel in Finland. Theoretical framework derives from a multidisciplinary approach with starting points from sport sociology, health sciences and business economics. The study was conducted as a case study in the Rehabilitation Centre & Spa Hotel Peurunka in

Central Finland. The data (n=755) was collected by using an ethno-survey sampling of the customers of Peurunka. The results indicate that Peurunka's customers are divided into three (3) basic segments according to their reasons and experiences for travel. Rehabilitation and health; sport and leisure and maintaining good abilities maintenance at

work were the main reasons for visiting Peurunka. Peurunka offers an interesting case study for sociological analysis. Originally built in 1974 for the rehabilitation of the Finnish war veterans the resort illustrates the changes and challenges of tourism and leisure in postindustrial Finland.

## Exercise Dependence and Eating Disorders in Fitness Centers

**Zsuzsa Menczel**, Semmelweis University, Budapest | [menczel.zsuzsa@gmail.com](mailto:menczel.zsuzsa@gmail.com)

**Eszter Kovacs**, Semmelweis University, Budapest | [kovacs.eszter@emk.sote.hu](mailto:kovacs.eszter@emk.sote.hu)

**Istvan Vingender**, Semmelweis University, Budapest | [vingenderi@se-etk.hu](mailto:vingenderi@se-etk.hu)

**Zsolt Demetrovics**, Eötvös Loránd University, Budapest | [demetrovics@t-online.hu](mailto:demetrovics@t-online.hu)

Exercise dependence (ED) is an extreme commitment to sports. ED was identified as behavioral addiction and first recognized as disease by Glasser in 1976. Previous studies have found that ED has strong relationship to eating disorders (EAT) that consist of addictive features, such as obsessive thoughts on body image and eating or compulsive behaviors. The objective of the present paper is to explore the prevalence of ED and EAT, and to reveal their relationship in a sample of fitness center users. Questionnaire survey was conducted in 32 fitness centers in Budapest, in 2010 (N=1732, 58.6% females, Mean age: 31.7 years of age). ED was measured by ED-Scale 21 items by Hausenblas and Symons Downs 2002; and EAT was investigated by SCOFF by Morgan et al. 1999. 2.2% of the respondents showed ED, 69.3% belonged to the risk group, while EAT was detected in 17.3%. Four groups were

distinguished based on presence of ED and EAT: 1) control group (80.8%), 2) EAT group (15.5%), 3) ED group (1.8%), and 4) EAT & ED group (1.8%). Women were overrepresented in all groups ( $p < .001$ ). In terms of sport attendance, we found that EAT group and ED group does sports about 6-10 times per week, and EAT & ED group 4 times weekly, that is significantly higher ( $p < .001$ ) compared to the controls. Observing the type of sport, difference was indicated in doing cardio type of moving or body building ( $p < .01$ ). The findings showed that the prevalence of ED and EAT is much higher among fitness center users than in normal population. This result might point out a strong link between the two symptoms. Further research is needed to investigate these phenomena separately and to gain deeper understanding of how fitness centers can contribute to improved health

## 03RN28 - Sociological Theory and Sport

Chair(s): Ørnulf Seippel (Norwegian University of Science and Technology, Norway)

### On the Use of Rational Choice Theory for the Sociology of Sport

Jens Flatau, Christian-Albrechts University of Kiel | [jflatau@email.uni-kiel.de](mailto:jflatau@email.uni-kiel.de)

Frank Schröder, Otto-Friedrich University Bamberg | [schreder.frank@googlemail.com](mailto:schreder.frank@googlemail.com)

Probably since its object is a highly physical societal practice, sport science tends to neglect theoretical foundation in its research [cf. Willimczik, 1991]. This is particularly evident in the sociology of sport, considering the important role of theories in the 'mother science'. The use of sociological theories can also be fruitful in a sport scientific context, though. A crucial aspect in all social sciences certainly is the understanding and explanation of micro-macro links, i.e. the connection of individual actions with consequences on the collective level (cf. Coleman, 1990). Rational choice theory (RCT) meets this requirement. Moreover, it bases on a just as simple as concrete model of man what makes it falsifiable what again is an important quality criterion for scientific theories (Popper, 1934). On the other hand, critics argue that it is too under-complex to explain social phenomena.

This lead to the development of a wide version of RCT that takes into account soft preferences/incentives as well as bounded rationality. However, along with this extension of pre-assumptions, the challenges of empirical conceptualization, operationalization and falsification rise. In this contribution, a real example from research on voluntary engagement in sport clubs is presented, starting with the translation of RCT's basic assumptions and specific conditions into a formal model and ending with the empirical testing. Finally, specific methodical problems and the general use of the wide RCT in the sociology of sport are discussed. References Coleman, J (1990). Foundations of Social Theory. Cambridge Popper, K (1934). The Logic of Scientific Discovery. London Willimczik, K (1991). Theorie der Sportwissenschaft. Bielefeld

### How can we Understand Emotions in Sports? A Theoretical Debate of Definitions of Emotions in the Thinking of Elias

Lone Friis Thing, University of Copenhagen | [lfthing@ifi.ku.dk](mailto:lfthing@ifi.ku.dk)

In 1939 Norbert Elias wrote The Civilizing Process in which emotions and the body are fundamental units of analysis. 50 years later became these crucial conceptual pivotal points for his analysis of leisure and sport. This paper is a theoretical discussion of Elias' concept of emotion (1991). The paper focuses on the concept of emotion and its application to understand sport. By defining and elaborating

the understanding of emotion in Elias and Dunning's Sport theory (1986) both strengths and weaknesses of the theory is emphasized. In this way the paper takes the point of Maguire (1992) about 'exciting significance' seriously. But how do we conceptualise emotions today? The paper will provide conceptual room for bodily aspects of social life in an effort to debate the biological need for emotions.

## The Thrill of the Fight - Emotional Experiences of Mimetic Violence

Christopher R Matthews, Nottingham Trent University | [dr.christopher.r.matthews@gmail.com](mailto:dr.christopher.r.matthews@gmail.com)

Using Elias & Dunning's (1986) 'Quest for Excitement', Maguire (1992) has theoretically and conceptually examined aspects of the emotional significance of participation in, and spectating of, certain sports. This paper explores such emotional and sensuous experiences within a boxing subculture. Specifically, the 'vibrant physicality' of

engaging in 'mimetic' violence with fellow boxers is described. Employing an Eliasian conception of habitus this paper weaves together wide social processes with local nuances and individualised identifications as frames for the embodied experiences of conducting and being the target of boxing 'violence'.

## The Social Status of Sports

Ørnulf Seippel, Norwegian Social Research | [ornulf.seippel@gmail.com](mailto:ornulf.seippel@gmail.com)

Most people seem to think that sports (at least in some form) and physical activity are social goods worth pursuing. Accordingly there are also several studies of the extent to which people do sports or/and is physically active. One factor one should assume is important both for the level of physical activity and the possibilities for legitimate policies in the field of sports is the status of sports: What people actually think about sports and its societal significance. In this study I will investigate the social status of sports, and two sets of opinions are in focus: Whether people think sports have

value and the extent to which sports is a societal and political responsibility. As in studies of physical activity itself, we assume that opinions on sports vary by age, gender and social class. Moreover, we expect to find significant differences between various nations when it comes to how sports are valued. Finally, we also want to look into the question of heterogeneous effects: how the effects of individual characteristics on the status of sports vary between nations. Analyses are based on the ISSP-survey on Leisure and Sports from 2007, covering 37 nations.

## 04\_05JS28 - The Commercialization of Sport and Fitness (2)

Chair(s): Roberta Sassatelli , University of Milan

### Anywhere, Anytime: Smartphone Apps, 'Mobile Privatization', and the Commodified Sporting Body

Brad Millington, University of Bath | [b.millington@bath.ac.uk](mailto:b.millington@bath.ac.uk)

This presentation examines a significant development in media culture: the promotion of health and fitness through Smartphone apps, or application software. Apps have

flourished in recent years, and in so doing have ushered in a trend towards mobile service procurement on task-specific online platforms. Health and fitness-themed apps have received

considerable attention from consumers and news media alike, yet despite past interest from scholars in technologically-enhanced forms of sport participation, they have thus far escaped academic attention. Drawing from an in-depth study of a selection of prominent health and fitness-themed apps, the presentation specifically highlights the unique ways in which these products 'treat' the sporting body. Study results first stress the emphasis apps place on self-improvement, as they enable activities like exercise tracking en route to achieving health and fitness goals. Following Williams' (1974) notion of 'mobile privatization', apps furthermore allow connections with the 'outside world' – whether

with like-minded consumers, social media networks, or marketing firms interested in consumer data. In both cases, app makers stress the inherent portability of their products by emphasizing that these services are available 'anywhere, anytime'. Having outlined these findings, the presentation turns to reflections on the implications of these new devices. While recognizing the possibility for consumer 'empowerment', it is argued that apps ultimately represent a new age in the history of commodifying the sporting body. Namely, by generating customized data from daily health and fitness activities, apps create potential revenue streams in ways that transcend even past fitness technologies.

## Body, Sport and Advertising: the Social Image of "Bio Brand"

Ivo Stefano Germano, University of Molise | [ivostefano.germano@unimol.it](mailto:ivostefano.germano@unimol.it)

Giovanna Russo, University of Bologna | [giovanna.russo6@unibo.it](mailto:giovanna.russo6@unibo.it)

This paper analyzes the role of relationship between body and sport in the advertising. In the fieldwork of communication, mass media and digital media, the body is one of the "passepartout" for the global brands not only in the sport wear or fashion system. The hypothesis of this paper is the following one: "the most communicative strategies are those which know to present your message according to the cultural dominant image of the sporting body. In the post-modern society, the sport facing a new environment by aesthetical social paradigm. In order to develop our hypothesis, we will use a multidimensional perspective based on works of a newest scientific literature, regarding to a central dimension structure of storytelling: the "bio-brand". Indeed, "bio-brand" is the visual and

pragmatical metamorphosis that involves mind, heart, brain and body of a consumer-performer, who not only does limit a simple relationship with the brand, but also produces and invents the brand. Methodologically, our proposal will be divided into a double analysis-observation: - co-production when a consumer-performer is interested in narrative dimension; - co-invention when a consumer-performer becomes a player or a communication referee. The hypothesis of research for this qualitative analysis is the following one: "The "bio-brand" that better represent the body image as an object modelling by aesthetical social paradigm it's also the same that better shows the activities of the contemporary advertising models.

## From Trainers to Personal Coach. Commercialism and Professionalism at Work in Fitness Realm.

Valerio Zanardi, University of Barcelona | [valerio\\_zanardi@yahoo.es](mailto:valerio_zanardi@yahoo.es)

This paper, based on an extensive ethnographical observation, and on a conspicuous number of depth interviews, firstly sets out to explore ambivalences and contradictions between professionalism and commercialism in the changing practises of the trainers in the fitness gyms. Since the fitness boom, gym trainers have been the depositary of the state of the art of the knowledge on bodily manipulation, basing their own expertise (and quest for professionalism) through the practical use of an heterogeneous set of abstract knowledges in assessing fitness practitioners, controlling the correct use of machines, acting as public relation officers. All these services were usually included in their working routines and offered to everybody. In last years, their occupational practices, their engagement and their professional strategies, have increasingly changed, turning themselves

into a sort of self-entrepreneurs figures, aimed at 1) Counselling (and selling) via a vis assessments to trainees, 2) Turning trainees into loyal customers, 3) Competing between themselves to attain the more customers (clients) as possible. In such a scenario, the ambivalence between the normative logic of professionalism and commercialism raise ethical and sociological issue. Secondly, the paper adopt some theoretical suggestions from the six-facet model of Richard Peterson, to underline causes and structural (legal, organizative and occupational) pre-conditions of the changing attitude of the physical fitness instructors. Finally the paper endeavours to grasp implications and consequences of the reshaping of the trainers activities, in relation to the transformations of trainees practices, perception and consumption of fitness culture.

## Zumba - a Pleasant Duty?

Dorota Zofia Olko, University of Warsaw | [dorota.olko@gmail.com](mailto:dorota.olko@gmail.com)

Images of perfect body promoted in media and popular culture push individuals into disciplining themselves by dieting regimes and physical exercises. Magazines and websites are full of tips how to get a slim and healthy body. But chase after an ideal body not only is connected to desire of being attractive and matching the beauty standards. The body is also seen as the visible indicator of the self. New middle class, with its obsession about self-discipline, is the main client of dieticians, coaches and fitness clubs. Consciously shaped body is a sign of specific features, skills and abilities, therefore it is permanently "under construction". However, as some theorists indicate (Bellah 1976) permanent self-control and medicalization of life change it into

survival, deprive it of taste and make personal fulfillment impossible. Sport is rather a duty than a fun – what was spontaneous and pleasant in the past, now is institutionalized. Such practices must have a bitter taste of a medicine. Members of middle class know it, but on the other side, they permanently try to run away from any determinations and constraint. How to reconcile these tendencies? The answer are emerging new forms of fitness, which are promoting as effective ones, but also pleasant and full of fun. One of such forms is zumba – Colombian dance fitness program created in 90s. Since then Zumba Fitness, a private company, has transformed into a rapidly growing fitness empire with heavyweight investor backing. This

presentation's aim is to answer how it was possible. Basing on qualitative research the author will try to analyse how the guidelines of

zumba respond to cultural changes and make this sport a commercial success.

## 04RN28 - Crossing Boundaries through Sport Events

Chair(s): Davide Sterchele (Leeds Metropolitan University)

### Physical Activity and Inclusive Social Change: a Way back from Sportization?

**Davide Sterchele**, Leeds Metropolitan University | [d.sterchele@leedsmet.ac.uk](mailto:d.sterchele@leedsmet.ac.uk)

Although many initiatives use sport as a tool to blur boundaries and foster social mixing, the way physical activity is organized and displayed for such purposes suggests critical reflections about the potential of sport in terms of social inclusivity. On the one hand, mainstream sport games often need to be adapted and partially de-structured by downplaying their competitive dimension, blurring categorizations through mixed-gender, -age, -ethnic, or -ability teams, and reducing the distinction between players and spectators. On the other hand, sport-based inclusive policies are increasingly using different lifestyle-sports or post-sports (such as for instance parkour), which are characterized by their non-competitive ethos and relatively unstructured form. Hence, while

the process of sportization as described by Elias and Dunning re-shaped old games by re-framing them as sports, when it comes to use physical activity to foster sociability, the trend seems to be the opposite, meaning sports being re-shaped (or de-shaped) into mere games and even less structured forms of play. Consequently, the following questions arise: Given that sport needs to be 'de-sportized' in order to foster sociability and inclusion, shouldn't we start to doubt about the real potential of sport in itself for such purposes? Shouldn't we speak about 'games' or 'play' for inclusive social change, rather than 'sport'? The paper explores these and similar questions drawing on both existing literature and the author's fieldwork.

### Is Sport-for-all still Possible and under what Condition? Poland as an Example of Multi-Dimensional Social Change in the Area of Sport

**Renata Włoch**, University of Warsaw | [renatawloch@gmail.com](mailto:renatawloch@gmail.com)

**Aleksandra Goldys**, University of Warsaw | [a.goldys@ps2012.pl](mailto:a.goldys@ps2012.pl)

The paper presents changes in the area of sport as one of the facets of multidimensional political, economical and social change in the post-communist Poland. In 2007 Poland and Ukraine were granted the right to host UEFA EURO 2012. This induced the government to develop an ambitious program of building over 2012 small sport facilities in the local communities. Additionally, on the wave of

interest evoked by approaching sport mega-event some third-sector organizations, and in the end, the Ministry of Sport, undertook the idea of sport-for-all as a kind of innovation to be introduced in the Polish context. The main thesis of the paper is that Poland may be treated as a kind of useful laboratory, in which processes of top-down and down-up social change may be observed. What makes the case

even more interesting is the fact that the Polish society has one of the lowest sport participation levels in Europe. Specifically, the Polish case allows to analyze the linkages between different factors determining physical activity: individual (e.g. the socio-economic situation, education, cultural capital, age, gender and ethnicity), infrastructural (accessibility of sport facilities) and systemic (the support of actors such as central and local government, sports clubs and organizations;

the existence of soft-skills programs supporting sport animators) (Hallmann et al. 2012, Allender et al. 2006). The paper is based on research carried in 2009-2012 by Social Action 2012 in cooperation with the Ministry of Sport, as well as the results of detailed evaluation of one of the UEFA social responsibility programs realized in Poland on the occasion of UEFA Euro 2012 and engaging sport animators (Respect your Health).

## Opportunity or Risk - Ambivalence of Euro 2012 and its Impact on Traditional Fan Communities

Jacek Burski, University of Lodz | [jacekburski84@gmail.com](mailto:jacekburski84@gmail.com)

Euro 2012 in Poland and Ukraine was the biggest sport event in history of Middle-East Europe. The tournament – beside of sport rivalry – had many aspects which I would like to investigate closely. In my paper I would like to examine impact of this specific Sport Mega Event on traditional fan communities. My research - conducted in social world of Polish football fandom - is showing that Euro 2012 can be seen as complex of opportunities and risks for these social groups. From one side, we can observe increasing level of social

control and media attention focused on traditional fan communities activity and - from other side - Euro 2012 has been used by football fan activists as an opportunity to unite traditional football fan movement. How these trends combine? What is (or was) the “real” stake of Euro 2012 in traditional football fan communities perspective? Where we can find social costs and profits of Euro 2012? I would like to answer these question in comparison with empirical material and existing research.

## 05\_16JS28 - Gender, Health and Physical Activity (1)

Chair(s): Ellen Annandale (University of York Oliver Williams - University of Leicester)

## Physical Activities in Medical Thermal Programs for Women: Between Health, Social Links and Rebuilding of Self-Image

Amélie Coulbaut-Lazzarini, Université Versailles Saint Quentin en Yvelines | [a.coulbautlazzarini@gmail.com](mailto:a.coulbautlazzarini@gmail.com)

This communication aims to present a research project that must lead to the implementation in a thermal center of a program including physical activities for women having suffered of a breast cancer.

Physical activities are seen in this program as a motor to restart social life and to improve quality of life of these women. It integrates the notion of social well-being in the definition of health. This communication will focus on the

first phase of the project which is about the state of the art and the recommendations to implement the program. This phase is important because it exists, on one side, theoretical elements on physical activities and health, and gender's construction, and on the other side several thermal programs including empirically these elements without having studied it. So we propose here to study what is already existing through the light of theoretical element about gender's construction, or more

precisely here gender's reconstruction, socio-motor physical activities and health in a wide sense. Our study takes place in the French context. It includes programs led these last years in different French thermal centers that implemented physical activities. It wants to show how these activities have an health and a social impact on women, when the French Health High Authority begins to recognize physical activities as a treatment.

## **Health, Body Shapes and Identities: A Study on the Moral Careers of Men and Women with Weight Problems**

Cristina Calvi, University of Eastern Piedmont | [cristina.calvi@sp.unipmn.it](mailto:cristina.calvi@sp.unipmn.it)

The presentation of the body became progressively a true presentation of the self (Goffman 2001). Through the development of technologies and techniques such as plastic surgery and diets, bodies not only becomes objects for the human "management" taking shape themselves as "real projects to be implemented"(Giddens 1991) with different characteristics depending on the gender and age of the subjects, but assume a role increasingly central to the identity of everyone. This paper intends to present the results of an empirical study that involved people suffering from first degree obesity and that they had begun a medical course of treatment. In particular, the research aimed to reconstruct: on the one hand, the practices and the meanings that influence the representations of states of health and disease for men and women; on the other hand, the moral career

(Goffman 2001) of a ill person and a patient, that is the (re)construction of identity of subjects as ill person and as patient, with particular attention to aspects referring to changes in the self perception stemming from changes in the "form" of the body and in his "capacities", and to gender differences. The research, referring to the theoretical paradigm of the life course, adopted a qualitative research perspective. In particular, I realized 22 biographical interviews with patients identified analyzing their medical history and their personal data carried out directly on hospital records, focusing attention to variables such as gender and age. The analysis of data enabled me to identify representations of states of health and disease closely linked to the gender dimension and to the age of subjects and three models of paths of moral career for all respondents.

## **A Gender Analysis of Weight Troubles: Ethical Implications of Eating Disorder and Obesity Prevention Practices.**

Manuela Ferrari, Centre for Addiction and Mental Health (CAMH), Toronto | [manuela.ferrari@utoronto.ca](mailto:manuela.ferrari@utoronto.ca)

Almost daily the media describe childhood obesity (OB) has one of the most serious public health challenges of the 21st century. At the

same time, research reveals that that girls as young as 6 already express body dissatisfaction and that more adolescents suffer from

disordered eating (ED). Although there is an overlap between the risk factors for ED and OB, prevention interventions continue to be conducted under two separate spheres of knowledge and practice. This generates inconsistency in the health messages delivered to the general public (e.g., OB interventions promote dieting to lose weight while ED prevention discourages dieting because it is identified to be a risk factor for ED). Through an analysis of the competitive discourses that emerge within the current ED and OB fields, this paper unpacks the gendered nature of ED and OB and practices that construct a healthy and active body. Furthermore, ethical consequences of current gender-neutral prevention practice (e.g., healthy eating and

active leaving). Data have been collected across Canada through interviews with 35 practitioners who work in either ED or OB (two in-depth interviews per practitioner), as well as through 6 focus groups and 12 in-depth interviews with 26 youths (aged 16–26) conducted as part of the Obesity and Disordered Eating in Youth (BODY) study. As the data analysis shows how there is disconnection between how healthy lifestyles are promoted by professionals (from both fields) and the contexts in which youth live their lives. For example, the impact that body-based harassment has on self-care, especially among girls and women, is a neglected area of prevention study. Implications for prevention, practice, and policy will be discussed.

## 05RN28 - Society and Sports (1)

Chair(s): Nicolas Delorme (University of Bordeaux)

### Cooperation in Health-Related Promotion of Physical Activity. The Perspective of the Health System on the Role of Sport

Enrico Michelini, Eberhard Karls University, Tübingen | [enrico.michelini@gmail.com](mailto:enrico.michelini@gmail.com)

Ansgar Thiel, Eberhard Karls University, Tübingen | [ansgar.thiel@uni-tuebingen.de](mailto:ansgar.thiel@uni-tuebingen.de)

The global spread of diseases connected to sedentariness is renewing the interest in the promotion of physical activity (PA). In the context of health-related PA, sport has traditionally been considered as a health-medium and the sport system has always had a leading role. However, recently the health system's communications on this topic are contradictory: on the one hand they only recommend moderate PA, and not sport, as conducive to good health (Oja, 2004); on the other hand, they still imply that the sport system is a key partner in the promotion of PA. Particularly at the empirical level this phenomenon has continued to be marginally discussed in the sociology of sport. To explore this contradiction, we analysed the contents of 15 documents for the promotion of PA issued

by the health ministries of France, Germany and Italy against the background of Luhmann's system theory (1984). The following trends have been detected: -The recommended PA is almost exclusively to be carried out in everyday life, should be moderate and should be health-orientated. -Sport organisations are often mentioned but are frequently entrusted with very abstract or sport-extraneous tasks. -For different reasons sport is sometimes devalued as a medium of health and even advised against. In conclusion, the health system's communications regarding the health-related promotion of PA are vague and refer exclusively to a "sport-hostile" logic. This background raises questions about the capability of such communications to stimulate positive cooperation (Willke, 2007) with the

sport system. However, the sport system is still the most relevant provider of health

promotion through PA and recent studies are revaluing the effect of sport on health.

## Who Says “No to Modern Football”? Reflexivity, Complexity and Ambiguity of Critical Football Fandom

Dino Numerato, Bocconi University | [dino.numerato@unibocconi.it](mailto:dino.numerato@unibocconi.it)

This paper explores complexities and ambiguities of the recently growing football fans criticism of the so-called “modern football”. Drawing on the existing elaborations of the reflexivity concept in sociology, this contribution theoretically moves beyond the hegemony/resistance analytical framework which has commonly been employed in existing research into the football fans critical engagement with modern football. The initiatives of engaged football fans were prevalently portrayed in strict opposition to neoliberal trends. This paper argues that contemporary critical fandom in times of its apparent societal proliferation cannot be exclusively portrayed in a homogenous manner, by emphasizing solely its anti-neoliberal gaze. A notion of relative resistance

is introduced to examine the processes, by which a critical potential of the fans criticism of modern football can be curtailed. It is argued that this the limitation of the critical potential can be caused by football fans’ strategic engagement with the media-sport nexus that inevitably leads to an adoption of the cultural grammar of neoliberalism. Second, it is suggested that the resistance potential can be limited as part of social processes such as rituality or sociability, through which the critical meaning of an apparently critical symbolic performance of football fans is emptied out. The paper will be empirically based primarily on the analysis of available documents (such as songs, slogans, banners, e-zines, or supporters’ associations’ websites).

## Plotting the Motivation of Student Volunteers in Sports-Based Outreach Work

John W Hayton, University of Hertfordshire | [j.hayton@herts.ac.uk](mailto:j.hayton@herts.ac.uk)

This paper examines the development of student volunteers’ motivation during their participation in a sports-based outreach project and how their experiences during the programme serve to influence their commitment and retention to it. The Sport Universities North East England (SUNEE) project represents an alliance between the region’s five universities to tackle social exclusion, and promote and nurture social capital and civil responsibility through the vehicle of sport. This joined-up approach to sports development provides the region’s student volunteers with vast opportunities to gain both experience and qualifications as sports coaches, mentors and leaders by working with a range of ‘hard to reach’ groups.

This work draws on qualitative data generated from semi-structured interviews (n=40) and describes a sequence of motivational transitions undergone by student volunteers over the course of their involvement in the project. In order to illustrate this, the paper applies the socio-psychological framework of Self-Determination Theory (SDT) to not only index the type of motivations that compel students to volunteer on the SUNEE project, but to also track motivational adaptation and reveal the features occurring within the project which serve to either facilitate or forestall volunteer motivation and dictate participant retention or conversely induce drop out (Deci and Ryan, 1985; 2000). By using the example of the SUNEE project, this research

demonstrates how students' motivation to volunteer changes from the 'extrinsic' (i.e. instrumental reasons such as enhancing one's

employability profile) to the 'intrinsic' (i.e. 'enjoying the experience') motivations the longer the person has taken part in the project.

## **German Student-Athletes between Conformity, Myth and Resistance**

**Benjamin Bendrich**, Georg-August-University Goettingen, Germany | [ben\\_bendrich@web.de](mailto:ben_bendrich@web.de)

The general public assumption is that German high profile athletes earn enough money to support themselves even after their career. This conclusion is amiss and only true for soccer. All other athletes heavily rely on jobs in the armed forces, federal border control, police or for a private sponsor. For athletes with higher educational aspirations, chances seem limited and often difficult. In general student-athletes are under incredible pressure academically and athletically. Today athletes frequently reach their limits and decide between either an academic or athletic career. Especially for high performance sports in Germany, this will be a serious problem in the future. This presentation is aiming to analyze international sports powerhouses and their support services, especially the US-universities and their success as well as

current problems in order to learn from these experiences and mistakes. The development of academic support services and "life skills" programs as well as the benefits and problems of today are analyzed through extensive qualitative and quantitative research data of German student athletes. The data was compiled in 2012-2013 and had some very astonishing results. There is no doubt that high-performance athletes need extra support. The question remains what kind of measures can be taken to improve the situation of student-athletes and how academic support services can do one's bit to improve the current situation and learn from experiences and mistakes of the past. The apparent structural problems in Germany show that considerable improvement is necessary.

## **(Non-)abusive Leadership in Swedish National Level Gymnastics – Portrayed and Dramatized in and by the Media**

**Jonas JM Stier**, Mälardalen University | [jonas.stier@mdh.se](mailto:jonas.stier@mdh.se)

**Helena Blomberg**, Mälardalen University | [helena.blomberg@mdh.se](mailto:helena.blomberg@mdh.se)

This study problematizes and discusses the heated media-debate during the year 2012 of what was called an abusive leadership culture at the national team level of gymnastics in Sweden. Empirical data are made up by articles published between January 14th 2012 and January 23rd 2013 in one of the largest Swedish daily newspapers, Dagens Nyheter. Theoretically and methodologically the study draws upon a discursive approach. Hence, it is assumed that media influences and confirms our understanding of the world, other people and ourselves – but also produces versions of

reality and inevitably exclude alternative versions. By the same token, it analyses how language is used to pursue social actions and how different actors express their views on the leader culture at the national team level. Focus is on what the media conveys and how statement of truth are constructed and legitimized by different actors – e.g. gymnasts, coaches and parents. Results show how different actors involved in the debate put forward accusations and defensive arguments in terms of perpetrators and victims. Among other things, it is concluded that the

predominant media dramaturgy is instrumental in introducing and establishing something as a social problem. Therefore, it is

also concluded that apart from victims, perpetrators and experts, media is a significant actor in the co-production of social problems.

## 06\_16JS28 - Gender, Health and Physical Activity (2)

Chair(s): Oliver Williams (University of Leicester), Ellen Annandale (University of York)

### Gendered Practices and Perceptions of the Sick Body. The Case of People Living with HIV in France

Laura Schuft, University of Nice Sophia Antipolis | [schuft@unice.fr](mailto:schuft@unice.fr)

Julie Thomas, University of Orléans | [juliethomas.professionnel@gmail.com](mailto:juliethomas.professionnel@gmail.com)

Estelle Duval, University of Montpellier | [duvalestelle@gmail.com](mailto:duvalestelle@gmail.com)

Based on field research (semi-structured interviews and participating observation) conducted in HIV-related associations and hospital groups in Nîmes, Montpellier and Nice, this paper deals with the discourse on fatigue and the practice and perceptions of physical activities of people living with HIV, according to gender and socioeconomic status. This work therefore broaches gendered practices and perceptions of the sick body in a context of twofold “crises”: one of public health outreach promoting physical activity to fight sedentary lifestyles, and one of an HIV epidemic that requires long-term treatment to attenuate symptoms. Although the health communities in France now promote active lifestyles and physical activity for people living with HIV, such promotion is unevenly effective. As views and experiences of the body are

known to differ greatly by gender and socioeconomic status, the question addressed here concerns how the discourse on fatigue and the practice and perception of physical activity differ according to these social characteristics. Women lacking in socioeconomic autonomy and status have been found, for example, to be more fatigued and less physically active than other social categories living with HIV (Thomas et al., 2012). Yet it remains to be explored how these differing social categories and positions, as well as the various stereotypes with which they are linked, play a role in the social interactions and discourse – of people living with HIV in France – that shape perceptions of fatigue, physical activity and the “sick” body. Such perceptions, in turn, influence the practices that determine more or less active lifestyles.

## The Body in Relation to Gender and “Healthy Citizenship”. A Comparative Analysis of Health Promotion Programs Implemented in Switzerland, France, Italy and Germany.

**Monica Aceti**, University of Strasbourg; IUHMSP-CHUV Lausanne | [monica.aceti@unifr.ch](mailto:monica.aceti@unifr.ch)

**Sandrine Knobé**, Université de Strasbourg | [knobe@unistra.fr](mailto:knobe@unistra.fr)

**Simone Digennaro**, Università degli Studi di Cassino, Université de Strasbourg | [s.digennaro@unicas.it](mailto:s.digennaro@unicas.it)

**Gilles Vieille Marchiset**, Université de Strasbourg | [vieillemarchiset@unistra.fr](mailto:vieillemarchiset@unistra.fr)

Good health is an issue endorsed by a certain number of public policies along with actors of civil society and the corporate world. The analysis of the narratives (discourses, speeches, etc.) and images of national programs promoting health in Italy (Guadagnare salute), Switzerland (Poids corporel sain) and Germany (in Form), highlights specific national variations, as well as convergences, among which an ethos on «healthy citizenship» (Gilloz, 1984; Guenter, 2012; Radel, 2012). The citizen is required to be more and more responsible for his/her health, while paying attention to his/her social environment. This process of “healthicization” of society oscillates between individual private sphere and collective public sphere. It also goes with the will of interiorization of a personal

responsibility expressed by the actor on the basis of self-government. Within a sociological perspective, comparing countries, we want to identify: 1) how the process of taking charge of one’s health is described and prescribed; 2) who are actors mobilized- along the public/private axis- to support these lifestyle changes. Furthermore, within a gender perspective, we aim to comprehend whether the programs refer to elements of sexual differentiation based on traditional labour division and family roles. Or in other words, if they promote a gender-specific involvement regarding health which embraces a devolution of gender specific skills or within the realm of gender stereotypes (Vuille, Rey, Füssinger, Cresson, 2006).

## Lifestyles and Sports of Teenagers. A Case Study in Italy

**Barbara Mazza**, University of Sapienza, Rome | [barbara.mazza@uniroma1.it](mailto:barbara.mazza@uniroma1.it)

The World Health Organization (WHO) has issued over the past decade, an alarm on a number of risk factors that can influence negatively the life of a man: a sedentary lifestyle, improper eating habits, as well as the use of smoking, drugs and alcohol not only affect adults, but in an even more significant and worrying about young people. Hence, it is necessary to intervene in order to improve people’s health by changing their lifestyles. In this regard, the ORSA (Regional Observatory sports Abruzzo) on behalf of CONI Abruzzo has conducted research in 2012 involving nearly

10,000 high school students (equivalent to 20% of the student population of the region) distribution by type of school attended, gender, age, province of residence, to ensure the representativeness of the sample. The survey examined by administering a semi-structured questionnaire and the construction of four focus groups (one in each province of the region), with the aim to investigate lifestyles, eating habits and exercise habits, with particular attention to the profiles of obese and severely underweight teenagers, which together account for almost one third of the

youth population. This is a first step in the knowledge base on which to take action to raise awareness and prevention with the help of all the Federations of the cones. The results

have been demonstrated fully in line with the national data (Istat 2010) and made it possible to provide a detailed and multifaceted condition and habits of young Abruzzo.

## 06RN28 - Society and Sports in Central/Eastern Europe

Chair(s): Enrico Michelini (University of Tübingen)

### Society and Sport in the Eastern-European Countries, Especially in Hungary

Andrea Gál, Semmelweis University, Budapest | [gala@tf.hu](mailto:gala@tf.hu)

Following the 1989-1990 political and economic transition, Hungarian sport had to adapt to the new economic and legal circumstances. Although the conditions of the civil takeover of sport were created, the collapse of the system of financing hindered its efficient completion. This phenomenon was especially apparent in elite sport, the number one beneficiary of the socialist sport model; the problems of other areas which used to receive less attention, such as Sport for All, physical education in schools, student sport and sport for the disabled, only emerged later and with less emphasis in political and social discourses. The objective of the present paper is to analyze the current relationship of

Hungarian society and sport, based on the research results of the recent period. During the analysis, the discussion of issues such as physical education, school sport, talent management, the sport consumption and sport participation of the population will also be complemented by the investigation of the role sport plays in the integration of different social groups and the construction of national identity amidst the processes of globalization. In the conclusions it is remarked that the ambivalent phenomena on the aforementioned areas and the changes in the societal attitudes to sport created a state of "neither with nor without" in the relationship of society and sport.

### Effect of Social, Environmental and Individual Factors on Students' Sporting Habits in a Hungarian-Romanian Cross Border Area

Klára Kovács, University of Debrecen | [kovacs.klarika87@gmail.com](mailto:kovacs.klarika87@gmail.com)

The aim of this paper is to examine what kind of social (socio-economic, social-cultural), environmental and individual factors affect the frequency of students' sport activity in a cross border area of Hungary and Romania, and what is the reason if they do not do any sport. To answer these questions I used a complex theoretical framework, which contains three pillars: Bourdieu's theory on capitals and habits, Hradil's theory on milieus and

Bandura's social learning theory. According to former researchers, only a quarter of young people between the age of 25 and 30 do sports regularly in Hungary. That is why it is important to examine the social and individual factors that affect whether students involve sport activities during university studies. The analyses, which are among the first in these countries, were performed using data collected within the "Higher Education for Social

Cohesion – Cooperative Research and Development in a Cross-border Area” project (N=2619). According to results of multivariable linear regression it can be said that the following factors determine students’ sport activities: gender, objective material status as social-demographic variables, and attitudes to importance of sport, taking part in sport events and sporting habits of best friends as

subjective, environmental and individual factors. These results support Hradil’s theory on milieus and Bourdieu’s theory on capital in part. Bandura’s social learning theory is supported by effect of best friend’s sporting habits. Based on our research results we can propose recommendations for different sporting facilities, which could be attract for students to do sport more regular.

## **Bicycle, Theatre and Class Lifestyles in contemporary Poland**

**Przemysław Sadura**, University of Warsaw | [sadurap@is.uw.edu.pl](mailto:sadurap@is.uw.edu.pl)

Paper is the analysis of class system in the contemporary Poland in terms of Pierre Bourdieu’ theory. The empirical part of the work is based on the analysis of almost two hundred in-depth interviews collected between 2008 and 2013 (most in cooperation with Maciej Gdula). The analysis includes interviews concerning influence of class position on people’s study style and cultural (especially theatre) participation as well as their attitudes towards bicycle (as a mean of transportation and leisure time activity). Conclusions are supported with some data form quantitative research on similar topics. Confrontation of Bourdieu’s and his followers’ theories with empirical material led me to conclude that the class lifestyle theory - though vivid and relevant to polish society - cannot be apply in

its orthodox version and needs reinterpretation. I propose to treat class lifestyles as competing universalities (general visions of the world). I have reconstructed the three main lifestyle variations demonstrating the different universalities of upper, middle and popular classes. Each of the classes presented dispositions, judgments, ways of behaving and evaluating social reality that exceeded particularism and implied claims to universality. In the answers concerning bicycles, theatre and culture, study or work, the representatives of each class manifested their ambitions to define the world in their own way. Those rival vision of social reality are specific to particular classes and embedded in rules which organize their life.

## **Change of the Values in Contemporary Lithuanian Sport**

**Dainius Genys**, Vytautas Magnus University, Kaunas | [d.genys@gmail.com](mailto:d.genys@gmail.com)

The aim of the paper is to discuss the change of the values represented by sport as a cultural text. The importance of popular culture texts lies in constant circulation, interpretation and reinterpretation process, but not in the texts themselves. The texts are undoubtedly the most important actors in the process, but they must be interpreted among other cultural texts and particular social reality (Fiske 2005: 4). Popular culture texts are not sufficient in themselves, they are inadequate, lonely and

isolated. They are built to provoke meanings and pleasures. Complete and full-fledged they become when are inserted in people’s daily routine and everyday culture. That is why sport is no longer just a sport in the context of pop culture, it is arena of celebrities, a place filled with popular illusions and promises of its fulfillment. Looking at the relationship between sport and pop culture, it is possible to notice certain causes of the values change in contemporary Lithuanian sport: public

attention and awareness of the sports world events are great, but more often they are interpreted, not through the recognition, discussion and analysis of the uniqueness of sports events, but through their importance and significance to popular culture in general. The analysis of in the paper discussed examples showed how various scandals and

focus on secondary, with a little sports-related, but actualized in the daily routine events, are becoming a substitute of sporting events. The desire of popular culture to escalate public imagination and become a source of pleasure, compound the identification of the major sporting problems.

## 07\_20JS28 - Sport and the Visual: New Developments and Opportunities

Chair(s): Roger Penn (Queen's University, Belfast), Ajit Singh (University of Bielefeld)

### Visualization of Knowledge and Embodiment within Coach-Athlete-Interaction

Ajit Singh , University of Bielefeld | [ajit.singh@uni-bielefeld.de](mailto:ajit.singh@uni-bielefeld.de)

Sport as a specialized environment of embodied practices seems to be predestined as a laboratory for observing and analyzing processes, where the use and visibility of bodies is an essential part of communication and social action. The case of trampoline jumping, in the context of young competitive sport, will be analyzed using video-based data of recorded training situations on the coach-athlete-interaction. Already Bateson and Mead (1942) in their study on Balinese culture pointed out, that methods of teaching and learning are not only verbal but also visual, embodied and kinaesthetic. Also Goffman stressed the expressive quality and meaning of the body ('display') in everyday life, focusing on the analysis of face-to-face-interactions in social situations. Referring to these considerations, I want to discuss the

constitutional role of physical representation and visualization as a relevant practice of conveying embodied knowledge in coach-athlete-interaction. Therefore firstly, various forms of multimodal instructions of "skills" (Schütz) and "techniques of the body" (Mauss) in the institutionally embedded coach-athlete-interaction are reconstructed. Secondly, I will show how in practices like demonstration, imitation and adaption, a sport specific identity is formed. 'Doing being' the 'trampoline jumper' is bodily and intersubjectively constructed based on physical visualization and performative habitualization. Finally and thirdly, it seems necessary to reflect methodologically the possibilities and limits of videographic fieldwork and the use of visual data for a deeper understanding of embodied and communicative action in sport.

### Ethical, Legal and Practical Issues in the Use of Visual Data within Sociology

Roger Penn, Queen's University, Belfast | [r.penn@qub.ac.uk](mailto:r.penn@qub.ac.uk)

Damon M Berridge, Lancaster University | [d.berridge@lancaster.ac.uk](mailto:d.berridge@lancaster.ac.uk)

The paper will examine the legal, ethical and practical issues that surround the use of visual materials in contemporary sociological

discourse and practice. The paper will explore the vexed question of the legality of taking photographs and videotext as part of any

empirical sociological project. The analysis will assess both current legal constraints and - more pertinently - contemporary views about what these laws constrain and restrict. These issues will be analysed within a comparative European perspective. Examples will be drawn from the authors' research on football in England and Italy. The paper will also explore the debate surrounding the ethics and norms of photographic practice within sociology. This will focus on the issue of 'consent' and the

conditions under which ethical approval of research is needed. The paper will propose a set of protocols that should be used in any sociological analysis that incorporates visual materials. The paper will also explore the practicalities of producing visual material and of publishing analyses that incorporate such data. These include difficulties surrounding the use of colour photographs and of presenting videotext evidence within conventional academic sociological outlets.

## The OZ Project: Observing Attention

**Roberta Ferrario**, Institute of Cognitive Science and Technology, Italian National Council of Researches - CNR, Rome | [roberta.ferrario@loa.istc.cnr.it](mailto:roberta.ferrario@loa.istc.cnr.it)

**Chiara Bassetti**, Italian National Council of Researches - CNR, Rome | [chiara.bassetti@loa.istc.cnr.it](mailto:chiara.bassetti@loa.istc.cnr.it)

**Marco Cristani**, University of Verona | [marco.cristani@univr.it](mailto:marco.cristani@univr.it)

**Francesco Setti**, CNR - Italian National Research Council, Rome | [francesco.setti@loa.istc.cnr.it](mailto:francesco.setti@loa.istc.cnr.it)

Understanding whether an event has attracted the audience attention and singling out the moments that have been mostly enjoyable is a primary goal for those who manage sport and show business, in order to ameliorate presentation strategies, logistic aspects, and the like of an event. So far, such activities have been based on data concerning the sold tickets and ex-post polls. OZ is an interdisciplinary, mixed-methods project that we propose for a methodological discussion. It aims at developing a technology able to automatically detect at run time if and how intensely attention is captured, via the use of models integrating computer vision and ontology. The ontological model will be built based on a sociological analysis of the audience's behavior. Leveraging on cheap and not invasive

sensors (cameras, microphones) directed towards the audience (whose privacy will be seriously taken into account), the result of the project should be an algorithm able to classify the public attention on a scale from 1 to 10 in a continuous way all throughout the sport event. The project's case study is the Trentino Winter Universiade (December 2013). Research activities are organized in: an evaluation phase antecedent to the event, in which sensors will be installed, ethnographic observation conducted, and the algorithm progressively refined and tested; an execution phase, in which the level of audience's attention will be measured; an evaluation phase, in which the performance of the algorithm will be finally compared with the results of an a-posteriori survey.

## Visualization of Visual Data - The Problem of Transcripts and the Play with Purity and Persuasion

Maud C. Hietzge, PH Freiburg | [hietzge@ph-freiburg.de](mailto:hietzge@ph-freiburg.de)

The paper is a methodological one. It starts with a short overview on recent developments of videographic data analysis of very different kinds (Streeck, Bohnsack, Knoblauch, Moritz, Loer etc.). Bodily interaction needs video documentation to analyse it more closely - this has always been clear in motion and game analysis, but seems to cause trouble in (sport) sociology. The results will be reviewed systematically in comparison to other paradigms, we get an idea, what would be missing without videographic research. Using different examples of videography (the close analysis of an extraordinary play activity of girls, Parkour videos, and boxing films) it will be shown how one can do visual research on different levels: the interaction in front of the

camera, the self-mediatization of youth cultures, and the intentional aesthetics of the body in film (Hietzge 2010, 2011, 2013). The argument is clear concerning the necessity to use visual data and to overcome the gap between ethnography and hermeneutics on one hand and 'scientistic' approaches (Hitzler) on the other. The interplay of numerical and visual data will be shown to work together. Videographic interaction analysis allows new evidence for bodily processes of subjectivation (Alkemeyer). The bodily reaction on other bodies action shows meaningful processes inspite of there tacit character (Polanyi). Videography is a means to unravel unconscious aspects of practices in the double perspective of simultaneity and sequentiality.

## 07RN28 - Sport, Media and New Media (1)

Chair(s): Françoise Papa (Université de Grenoble - Alpes)

### Sporting Audiences in Italy (2000-2010) Observing the Dynamic Center of the "Sports-media-sponsors triangle"

Stefano Martelli, University of Bologna | [s.martelli@unibo.it](mailto:s.martelli@unibo.it)

This paper collects some main findings obtained by SportComLab, the Laboratory of Sport Communication of the University of Bologna "Alma Mater Studiorum", about millions of Italian viewers, who exposed themselves at the sport mega-events, played in the years 2002, 2006, and 2010, such as three Fifa world Cups, and three editions of Winter Olympics and Paralympics. I tried to interpret the choices of Italian sport viewers, starting from a theoretical background in Sociology of sport and media, which I revisited

and reshaped. The proposed concept of «Sms (Sports, Media, & Sponsors) triangle» permits to better observe the relevant social position of audiences, which are the dynamic nucleus of this new social configuration: in effect, sport audiences are composed by a threefold mass of sport practicers, viewers, and customers [n. 1]. So the findings here presented, about amplitude and social characteristics of Italian sport audiences in the period 2002-2010, permit to have a insightful knowledge of the relationships inside the Italian version of this

social figuration, such as the female choices [n. 2]. Finally three sociographic profiles will offer some starting points to map the sport

subcultures in Italy, such as the football subculture, and the two winter subculture in Olympics Paralympics [n. 3].

## Qualitative Sports Research on Facebook

Ester Wisse, Mulier Institute | [e.wisse@mulierinstituut.nl](mailto:e.wisse@mulierinstituut.nl)

In the Netherlands, just as in most other countries, facebook is the most frequently used social network among young (and older) people. Nine out of ten Dutch youngsters (age 15-20) use facebook weekly. Two thirds of this group say they also use facebook for sporting purposes. There is a growing body of research that accompanies the rise of Facebook as social scientists assess the impact of facebook on social life, especially in the field of identity communication and presentation. Some scholars regard facebook as an ongoing database of social activity, filled with information about human behavior and interaction which normally is not easily accessible for scientists. In regard to sociological sports studies, facebook research is not common practice yet. Neither is it clear how this expanding database should be

properly accessed and how the facebook data should be interpreted and analysed. Especially the field of qualitative/ethnographic/participatory (sports) research on facebook is relatively unexplored. In this presentation I will contribute to this new methodological debate in social sciences in general and sociological sports research in specific. I will discuss some qualitative research methods used in a pilot study about young people's sports related use of social media and identity representation and development on facebook. Besides methodological aspects, I will also outline some preliminary results of the study such as on the nature of sports related social media use among youngsters and how this relates to sports participation and identity development.

## The Italian Audiences of the Paralympic Games (2000-2010). From "phantom acceptance" to New Resource for Sport and Media

Giovanna Russo , University of Bologna | [giovanna.russo6@unibo.it](mailto:giovanna.russo6@unibo.it)

The interdependencies that since several years characterize the relationship between media companies and sports highlight a new configuration - a new emerging structure - in which the sports audiences play a fundamental role. They are in fact in the middle of the Sms triangle (sports, media, sponsors) since they trigger the circuit of production and consumption of "mediated" sports [Martelli 2010, 2011, 2012]. In this context, this contribution intent on proposing a relational reading [Donati 2010, Martelli 2010, 2012] of the Paralympic Games - the leading global event for the representation of disability - while also providing an overview of the television

audiences who have followed that show in the Italian context. Starting from the analysis of Auditel data (summer and winter editions) of the Paralympic Games held in the new millennium (2000-2010), I will present the socio demographic profiles of these audiences, explaining in what sense the Paralympics can be considered a "global" sporting event capable of new trends emerging in media consumption. In this context the controversial relationship between sport, media and disability takes on new meanings. The Paralympic sport can be distinguished as a privileged place not only for the construction of the positive-identities "acceptance" [Goffman

1983] of the individual/disabled athlete but also to place the disability in the institutional context in an appropriate manner: no longer a "phantom acceptance" [ibid], but a resource

capable of activating forms of exchange with the productive environment [Donati 2010, Ferrucci 2009].

## 08\_b07JS28JS34 - Sport and Religion/Spirituality

Chair(s): Stef Aupers (Erasmus University, Rotterdam), Davide Sterchele (Leeds Metropolitan University), Hubert Knoblauch (Technische Universität Berlin)

### Embodied Spirituality in Yoga Practice

Clemens W. Eisenmann, University of Bielefeld | [Clemens.Eisenmann@uni-bielefeld.de](mailto:Clemens.Eisenmann@uni-bielefeld.de)

In the field of contemporary spirituality, bodily practices like yoga are attributed central importance for achieving specific 'personal experiences'. Thus in ethno-theory, the body mediates between spiritual experiences and knowledge of salvation, although many experiences, like the perception of chakras and energies, go explicitly beyond the physical, referring instead e.g. to the 'true self'. This leads to the central question of my presentation: What is the role of the body in the construction of spirituality? With regard to yoga, Marcel Mauss already assumed a 'socio-psycho-biological' connection between 'mystical states' and 'techniques of the body', and thereby suggested it as an intriguing case for analysis. However, looking from a sociological point of view at a group of people standing on their heads is analytically and methodologically challenging. The sociology of

spirituality has mainly focused on macro phenomena like secularisation, individualisation, or subjectivisation. Drawing on recent endeavours in practice theory and sociology of the body, I sketch an approach, which considers the actual yoga practices and the role of the body in their relation to the construction of spirituality. Based on my ethnographic fieldwork and video recordings, I will show how the body becomes relevant on various levels ranging from the 'discursive body', over bodily interactions, indication, mediation, representation, to the actual lived body experience. I will argue that by taking the lived body experience into account, practice theory needs to be complemented by phenomenological considerations, which also calls for further methodological reflection to recognize the multiple dimensions of embodiment in yoga practice.

### Manga, Wuxia and (New) Religious Syncretisms. The Orientalization of Western Imaginary, from Osamu Tezuka to Contemporary Oriental Disciplines

Alessandro Porrovecchio, University of the Littoral Opal Coast | [alessandro.porrovecchio@gmail.com](mailto:alessandro.porrovecchio@gmail.com)

A new interest in various forms of spirituality and "mythical orients" is emerging in some subcultures of contemporary society. Wuxia movies, mangas, sushi bars and martial arts

are some significant case studies to analyze the on-going orientalization process. These phenomena have become part of many people's daily life and have affected the ways of

dressing, the way of eating and other major changes, as values, ethics and morality. To explore the orientalizing process, in a first step I introduce some features of the diffusion of the “mythical orient” in the Western imaginary since the sixties. In particular, I focus on some media products (for example, mangas and wuxia movies) that supposedly played an important role in arousing interest in Other worlds. In this stage I'll refer to some media theories, in particular to Gerbner's cultivation theory and to the medial socialization effect. In a second step I focus on the imaginary embodied in some oriental

disciplines. I refer to some results of a research that I'm conducting in some martial arts gyms, starting from my experience as an instructor. In that context I performed an ethnographic research, I gathered several in-depth interviews with some masters, beginners, fighters and therapists, and I analysed the interactions within some online communities (virtual ethnography). This last method allowed me to come back to the first step, and to focus on how some features of the media imaginary are mediated through the interactions within the virtual communities.

## **“If you're Jewish how Can you not Believe in God?” Sport and the Challenge of Interfaith Dialogue in the Absence of Faith**

Lucy Mayblin, University of Sheffield | [L.mayblin@sheffield.ac.uk](mailto:L.mayblin@sheffield.ac.uk)

This paper reports on research conducted as part of an FP7 project, 'LIVEDIFFERENCE', which is investigating how people live with difference in Europe, and how 'meaningful contact' is, or might be encouraged, to occur. Here, I discuss one case study, a voluntary sector interfaith sports project in a British city. The project sought to bring Jewish and Muslim young men together across religious, geographical and class based divides in order to expose them to people who are different from themselves, open dialogue, and garner mutual understanding. These goals were not automatically achieved by sport activity itself and additional work was necessary to encourage meaningful interaction. And yet, depending on the 'common ground' of faith to bring the young men together brought unforeseen challenges: many of the Jewish

young men did not believe in God, they described themselves as 'secular' or 'cultural' Jews. While this identity was acceptable in their faith community, for the young Muslims such an idea was incomprehensible. For them, believing in God was the central tenet of their imagined commonality with their Jewish counterparts. The issue came up time and again: “if you're Jewish how can you not believe in God?” This paper therefore explores themes of religious identity and the ways in which sports projects are able to facilitate dialogue between diverse groups. The necessity of a central common interest, such as religion, above and beyond the sport itself, in enabling 'meaningful contact' is discussed, as are possibilities and limits of organizational strategies aimed at enhancing participants' reflexivity.

## 08RN28 - Sport, Media and New Media (2)

Chair(s): Stefano Martelli (University of Bologna)

### Impact of Imaging Techniques and TV Exposure on Football Referees

Borel-Hänni François, University of Lille-2, ER3S (EA4110) | [pacoborel@yahoo.fr](mailto:pacoborel@yahoo.fr)

Television has become the lens through which a majority of people get informed about football and also, thanks to broadcasting rights and advertisement, the fuel of the sport's economy. With football almost 24/7 on air through live games and talk-shows, TV networks have conquered an overarching power over game policy and are able to impose massive reforms in fields as various as stadium architecture, competition formats or club financing. However, TV influence has so far not spread to the rules of football. It could soon with the introduction of video assistance for referees. Its defenders argue that the stakes and scope of football are so huge nowadays that referees need some help. But FIFA and IFAB are opposed to it. What position hold the media in this debate? By calling for

the use of imaging techniques, they tend to substitute referees' legal authority and expertise with their own. Which suggests that TV exposure may have affected the public perception of referees by focusing on their mistakes. A diachronic and synchronic survey of TV and printed press coverage of the last 12 World Cups confirms that there has been a shift in journalistic discourse about referees' competence, legitimacy and authority. Indeed, imaging techniques have become the ultimate proof to judge referees' performances. It means that TV pundits, commentators, directors and camera crews hold some power over referees. It remains to see if this imbalance is acknowledged and taken in account by any of the actors involved.

### Media Representation and Status of Coaches Football Hero to Scapegoat

Pierre Mignot, University of Toulouse | [pierre.mignot@iut-tlse3.fr](mailto:pierre.mignot@iut-tlse3.fr)

The coach has become in recent years, the new link between the players "gods of the stadium", the public and the media increasingly present. Its role has become essential and he becomes a central figure who enjoys three ways: the technical leader of the club, the father protecting players and finally that of the communicating privileged by all media. This representation of the coach was thus built between two limit states on the one hand it represents the hero (even the herald) of the club and the other in the opposite case, it is the one through whom bears responsibility failure.

In this very general questions that we propose to address this communication are as follows: How sports media involved in the construction of media's representations of the coach between hero and target? How does it become in time a figure hinge of the world sport? Our answers are based on two methodological approaches: first one historiographical relies on the French media sport, "l'Equipe" between 1946 and 2010. On the other hand, following the evolution of the role and importance of coaches and the media portrayal that gave newspaper.

## Racial Stereotypes and High-Level Sport: a Comparative Analysis of the "White" and the "Black" Athlete's Figure

Lucie Forté, University of Toulouse 3 | [lucie.forte@univ-tlse3.fr](mailto:lucie.forte@univ-tlse3.fr)

Vincent Charlot, University of Toulouse 3 | [vincent.charlot@univ-tlse3.fr](mailto:vincent.charlot@univ-tlse3.fr)

The communication deals with the spread and the banalization of racial and ethnic stereotypes in the press during the European championships of athletics - in Barcelona 2010. Thanks to an analysis of the metaphors and the justifications used in the French sportive newspaper called "L'Equipe", we can observe the strength and the durability of sports skill's naturalization toward "blacks" athletes. Indeed, the speeches produced in the particular context of the triple victory of a "white" short-distance runner on 100 meters, 200 meters and 4x100 meters constitutes a interesting window for the analysis of the persistence and the foundations of racial stereotypes according to which the

performances of the "blacks" athletes would recover from innate and bestial skills, whereas those of the "whites" athletes would be connected to their values of hard work and their intelligence. The corpus we studied is made of different types of articles (65) and chronicles (8) published in "L'Equipe" between July 27th and August 3rd, 2010 - representing 100 % of the championship's coverage by the French newspaper. The choice of this competition is overall justified by the strong interest that the specialized and unspecialized press reserved to the historical success of a "white" short distance runner. The choice of "L'Equipe" is justified by the fact that it is the only quotidian sportive newspaper in France.

## Dying to Win: a Theoretical Consideration of Death and the Construction of Sporting Celebrity

Oli Williams, University of Leicester | [osw1@le.ac.uk](mailto:osw1@le.ac.uk)

Death is conventionally considered the ultimate crisis in a sporting career; with no possibility of potential being realised performance related goals remain unachieved. In terms of achieving success - winning medals, breaking records, scoring goals - the career is over. The untimely death of sporting heroes reminds us that these bodies, capable of 'superhuman' performances, are mortal just like any other and fans are left to wonder 'what might have been?' As sport has increasingly become a mediated event, those whose performances thrust them into the media spotlight become celebrities. However, in the realm of celebrity, sporting success does not necessarily correlate with the level of stardom performers 'achieve'. The media is increasingly instrumental in shaping performers' identities. For this reason death might not be considered

a crisis at all when considering enduring sporting celebrity. This paper draws on theoretical insights, chiefly those of Jean Baudrillard, to analyse the influence of death on sporting celebrity. The story of 1970s American runner Steve Prefontaine is used to illustrate how for some dying, while the possibility of sporting success is still conceivable, is anything but a crisis in terms of achieving celebrity. Analysing Prefontaine's death and subsequent celebrity status facilitates addressing; 1. How death and its mediation can lead to sporting potential being 'realised'; 2. How media aids fans in according posthumous greatness to sporting figures once the mortal body has perished but the question of 'what if?' remains open to interpretation, and; 3. Why, in terms of celebrity, former footballer Fabrice Muamba is fortunate to be

alive while Tiger Woods would have been better off dead.

## 09\_20JS21JS28 - Doing Social Research on Sports. Methodological and Empirical Challenges (1)

Chair(s): Alessandro Porrovecchio (University of Torino), Ajit Singh (University of Bielefeld), Katarina Jacobsson (Lund University)

### Sex Equity in Sports Media: An Invitation to Open a Methodological Discussion

Nicolas Delorme, University Bordeaux Segalen | [nico\\_delorme@hotmail.com](mailto:nico_delorme@hotmail.com)

In the last decades, the media coverage of sport in relation to participants' sex has been extensively analysed in the scientific literature. As one of the most covered international sport competitions, the Olympic Games provide an interesting database for studies investigating differences in journalistic treatment according to athletes' sex. The majority of these studies concluded that women were underrepresented in the media coverage of this event. However, there is an important heterogeneity in how to proceed to determine whether media coverage in relation to athletes' sex is equitable. Therefore, the aims of this study are to determine the most appropriate standards for this comparison and to use them to assess whether there are biases in the journalistic coverage of the Olympics, using data from previous studies ( $n = 18$ ). Equitable media coverage could be measured using a chi-

square goodness-of-fit test in four distinct ways: (a) using the global representation of each sex in the considered Olympics; (b) using the representation of each sex in the considered Olympic team; (c) using the percentage of available events for each sex in the considered Olympics and (d) using the representation of each sex in the number of events for which a given country fields a team/athlete. Results show that media coverage is far from being detrimental to women: they are either equitably represented (28.79%) or significantly overrepresented (46.97%). Indeed, all modalities combined, women are only underrepresented in 22.24% of cases. In most cases, these results significantly differ from those of previous research and stress the importance and the need to take methodological precautions for this type of study.

### Crisis in Body- A Qualitative Insight into a Process of Physical Therapy.

Dominika Byczkowska, University of Lodz | [dominikita@wp.pl](mailto:dominikita@wp.pl)

In the paper there will be presented an outcome of a study on social aspects of embodiment, concerning body in crises after serious bodily change such as an accident, stroke or during a course of other illnesses. The crises may take various forms- physical crisis, crisis of self identification, crisis in interactions with close ones, serious changes

in everyday life and many other. The process of physical therapy is used as a mean to regain lost skills (e.g. everyday skills, interactional skills); to rebuild lost identities; to become as independent as possible. The general aim of this process is to get back the life that one had before the crisis, as well as possible. The paper discusses also ways of coping and not

coping with the crises, ways of reconstructing what was lost in an individual's life, as well as emotions and feelings that appear (like fear or disappointment) or that are no longer present (like self-acceptance, pride) during the crises. The process of physical therapy will be presented in context of Polish medical care system. In the study there have been used an autoethnography, interview and participant

observation as main research methods. I will also compare some of the conclusions with my former study which showed a way of using one's body as a tool of building a dancer's career. In the paper I will set an important question of subjective and emotional commitment of a researcher to a subject of research.

## **Climbing Walls, Making Bridges: Innovative Methodologies, Embodied Identities, Space & the Cultural Politics of Capoeira**

**Michael L Silk**, University of Bath | [m.silk@bath.ac.uk](mailto:m.silk@bath.ac.uk)

**Nicola De Martini Ugolotti**, University of Bath | [nicola.demartiniugolotti@gmail.com](mailto:nicola.demartiniugolotti@gmail.com)

**Ceri Brown**, University of Bath | [C.L.Brown@bath.ac.uk](mailto:C.L.Brown@bath.ac.uk)

In this paper we explore the ontological, epistemological, axiological and methodological contingencies at the intersections of identity politics, physicality, embodiment and space. As a lens through which to consider the researcher/researched body, we focus on our on-going work that addresses the processes by which (marginalized) migrant young people navigate spaces of inclusion and exclusion within the multiple materialities and discursive narratives of urban space. This work centres on the performative body practices of young men between 13 and 20 engaging in capoeira and parkour as it articulates with notions of citizenship, identity, visibility, and the recognition of young geographically transitory people in Italian public life. Addressing identities that are put 'to work' towards a sense of belonging and self worth, we explore

the messiness of reflexivity and empirical vulnerability as we engage the body in redefining the boundaries of knowledge production, performativity, and physicality: a project that we see as productive for the future potentialities of the 'sociology of sport'. We advocate for research that centralises corporeal movement and which is suggestive of an innovative approach that elicits or allows for a fuller exposition of the cultures of the body that are being experienced (Giardina & Newman, 2011). Such an approach is one that can destabilize taken for granted forms of knowledge, makes salient the discursive currents of gender, race, class, ethnicity, religion that converge and permeate cultural spaces/'sites, and that ultimately can aid in unlocking the processes of identity construction for migrant young people within spaces of inclusion / exclusion.

## Performance in Archery. An Ethnographic Approach to Research the Social Construction of Embodied and Tacit Knowledge in Sports.

Christoph Maeder, Thurgau University of Teacher Education | [christoph.maeder@phtg.ch](mailto:christoph.maeder@phtg.ch)

Archery as an old practice of the humans, which initially was used for hunting and fighting in conflicts, has become domesticated. Nowadays archery is performed mainly as a sport and is even an Olympic discipline. While for the outsider it seems quite obvious what archers do, namely shooting arrows on targets, there is also a more intricate insiders view. In the latter perspective the flying arrow is the product of a complex process of a disciplined body, the use of special artifacts and a correspondingly adapted and specially trained mind. Some of the knowledge to become a successful archer can be expressed verbally. But a lot of the performing competence as a skilled archer can only be gained through

'learning by doing it'. Or "you need to feel it, you need to get the feeling", like some archers say. The production of this feeling refers to embodied and even tacit knowledge necessary to perform in nearly any sport, not only in archery. But how is this feeling socially produced? In my contribution I want to address the question of how we as sociologists can understand, describe and analyze the different forms of knowledge necessary to perform in sports. As an ethnographic case I use the example of archery, where the body, artifacts and the mindset of the performer have to be trained and packed together on different levels: verbally, emotionally and physically.

## 09RN28 - Sport, Media and New Media (3)

Chair(s): Nicolas Delorme (University of Bordeaux)

### Olympics 2.0: Communicating the Olympics in a Post-Broadcast Age

Françoise Papa, University of Grenoble Alpes | [francoise.papa@u-grenoble3.fr](mailto:francoise.papa@u-grenoble3.fr)

Jean-Marc Francony, University of Grenoble Alpes | [jeanmarc.francony@umrpacte.fr](mailto:jeanmarc.francony@umrpacte.fr)

The web technologies gave a key impetus for the creation of digital hubs to broadcast sport events. This presentation outlines the evolution of Olympic communication during the last Olympiad and stresses more specifically: - on the analysis of TV and web communication devices set up by organizing committees and broadcasters; - on the way people – individuals as well as communities, express themselves and communicate on social networks and interact with Olympic communication devices. To carry out this study, in collaboration with the French national library, we created an

archive of websites and social networks sites related to Vancouver and London Olympics, and a collection of tweets harvested during the London Olympics, of which we present the main features: a methodological insight will be discussed. Indeed, while developing communication on social networks, the organizers gave to the audience new frames for experiencing the Games. Nevertheless, the analysis highlights the contradiction between the generalization of social communication and the need for the organizers to master the contents and to keep their capacity of framing

communication during the Games. This results in the enactment of rules and standards for usages of social media, characteristic of this ambivalence, of which London Games have provided some illustrations. The situation of Olympic athletes will be emphasized, notably considering their communication on the web

and on twitter. The study shows the limits of a strategy of control in regard to a collective construction of the meanings of the Olympic Games, which is a requirement for a common belief in the values of Olympism and for their dissemination.

## **New Ways of Viewing the Female Sporting Body: The Representation of Sportswomen's Bodies in British, Contemporary Print Media**

**Amy Godoy-Pressland**, University of East Anglia | [amypressland@gmail.com](mailto:amypressland@gmail.com)

Research on the print media representation of sportswomen has mostly agreed that female athletes are significantly under-represented (Eastman & Billings 1999; Boyle & Haynes 2000). Post-2000 literature, however, has begun to question this finding and some scholars argue that there is a move towards gender equality in sports coverage, particularly during major sporting events. It has also been suggested that women are being taken more seriously as athletes (Biscomb & Griggs 2012) in their media coverage. This paper refutes these claims by showing how over a two-year semi-longitudinal timeframe (Jan 2008-Dec 2009) sportswomen were quantitatively under-represented in five British middle-brow Sunday newspapers. Moreover, this data demonstrates how female athletes were subject to mis-

representation during this period, in particular, in the framing of female bodies in seven distinct ways. These categories, which emerged from the data, include: the body (1) as sexualised, (2) trivialised, (3) secondary, (4) ambitious, (5) commercial, (6) feminine and (7) disposable. This paper builds on previous work on bodies in sports media (Harris & Clayton 2002; Heywood & Dworkin 2003) and looks to explore how, in an era when findings suggest greater gender equality, sportswomen's bodies continue to be categorised primarily in ways unrelated to sport. The image of sportswomen in the five newspapers under review could really be said to be the image of women rather than sportswomen since they were portrayed in a way that negated athleticism and promoted normative femininity.

## **The Beautiful and the Damned: The Influence of Specialized Media on the Development of Professional Rock Climbers.**

**Guillaume Dumont**, University Claude Bernard Lyon 1 - Autonomous University of Madrid | [guidumo@gmail.com](mailto:guidumo@gmail.com)

This paper focuses on the relationship between the recent professionalization of climbing and the role played by specialized media, more specifically the intense circulation of information through internet and social media. If physical performance in the sport is a central aspect of the professionalization within rock-climbing, it appears that the development and pursuit of a career as a professional rock-

climber depends on other matters too. Being the strongest does not seem to be the key to becoming a professional athlete. Rather, the ability to create, develop and maintain strong relationships with the specialized media and the industry, and promote oneself as an athlete. Mobilizing the "lifestyle sports" theory and recent studies on the relationships between sport and media in the so-called

“subcultures” or “post-subcultures”, we will examine how the media and the diffusion of the performance through social and visual networks construct a climber into a professional. Based on multi-sited fieldwork in

Europe and the USA, this paper is the continuation of a descriptive and explorative long-term ethnographic study centered on the professionalization of rock climbing.

### Avoiding Social Desirability Bias by Means of Indirect Questioning

Jens Flatau, Christian-Albrechts University of Kiel | [jflatau@email.uni-kiel.de](mailto:jflatau@email.uni-kiel.de)

Frank Schröder, Otto-Friedrich University Bamberg | [schreder.frank@googlemail.com](mailto:schreder.frank@googlemail.com)

**Introduction** Social desirability bias is a long known but so far only rudimentary solved problem in social survey research. On the basis of a real research example, this contribution demonstrates how this bias can be reduced applying the method of indirect questioning. **Research Problem** Voluntary engagement in sport clubs itself is no reason to be embarrassed for. However, altruistic motives for it like the desire to help others are certainly regarded to be more honourable than egoistic ones like the promotion of one's occupational career. Thus, particularly rational egoistic actors can be expected to hide their true intentions and questionnaire surveys on their prevalence are confronted with the social desirability problem. **Method** Fisher (1993) could demonstrate that the social desirability bias can be reduced by indirect questioning. His approach is adapted to the mentioned

research project. Besides direct questioning, two sorts of indirect questions are used regarding similar items representing different kinds of motives for voluntary engagement. Firstly, the interviewees are asked what they think the motives of the other volunteers in the club are. Secondly, they are asked to rate their actually gained utility from their engagement, independent from their intentions. **Results** The study reveals high differences between the corresponding items' values, as expected notably between self- and external attribution. Distinct 'dissonance patterns' can be identified that correlate with socio-economic variables as well as with the temporal extent of the voluntary engagement. **References** Fisher, R (1993). Social Desirability Bias and the Validity of Indirect Questioning. J. of Consumer Research, 20, 2, 303-315

## The Interactive Construction of Sport/Illness Life Histories of Chronically Ill People. An Innovative Approach to Study the Meaning of Sport in Times of Health and Illness.

Mirjam Stuij, Mulier Institute | [m.stuij@mulierinstituut.nl](mailto:m.stuij@mulierinstituut.nl)

Agnes Elling, Mulier Institute | [a.elling@mulierinstituut.nl](mailto:a.elling@mulierinstituut.nl)

People's personal sporting behaviour and attitude towards sport and physical activity are related to one's individual sporting biography and experiences as well as to broader social conditions, perceived expectations and constraints. Influential life events like illness may influence both people's actual and future sporting behaviour and the meanings given to sport and physical activity. Besides an individual process, this is also a cultural and socio-political one, in which patients can accept, negotiate with or resist the most prominent types of success stories ("recovery through sport") as well as the most prominent health discourse ("sport is good for health"). Our study focuses on the (interactive construction of) narratives around sport, physical activity and health of people with a

chronic illness, especially in interaction with their (allied) medical professionals. Therefore, we created a cyclical narrative design where the emphasis is on encounters of different story lines of patients and their professionals. We use a mixed methods design in which we combine surveys among patients, interviews with (allied) medical professionals, sport/illness life histories of patients and ethnographic studies in medical settings. Based on three different pilot studies, this paper introduces our method of collecting sport/illness life histories of patients, with its strengths and weaknesses, and their different contributions to gaining insight in the co-production, negotiation and criticizing of patient's different sporting bodies, identities and practices.

## Exploring the Validity of 'Sport' as a Sociological Concept.

Susan M. Lagaert, Ghent University | [Susan.Lagaert@Ugent.be](mailto:Susan.Lagaert@Ugent.be)

Henk Roose, Ghent University | [henk.roose@ugent.be](mailto:henk.roose@ugent.be)

In this contribution we raise a number of critical issues about how 'sport' is used as a sociological concept in the current quantitative literature on sports participation. We argue that if 'sport' wants to be an adequate and valid concept in sociology, and in the sociology of culture in particular, two related threats need to be considered and overcome: (1) the adequacy of a conceptual definition should be evaluated also in terms of sport activities as being culturally distinguishing practices, and (2) the validity of its measurement in surveys should be evaluated. Often, definitions of 'sport' one-sidedly focus on physical exertion or competitiveness, which neglects the socially distinguishing nature of specific forms of

sports as part of a lifestyle. The phrasing in questionnaires often reflects a specific definition of 'sport', limiting possibilities for analysis. Moreover, it is assumed that 'sport' has an obviously similar meaning to respondents in questionnaires, cf. the wording in the Eurobarometer (2010): 'How often do you exercise or play sport?' Yet, different types of respondents may interpret 'sport' in different ways, undermining the validity of its measurement and hence, its suitability for sound sociological analysis. Using data from the survey 'Cultural participation in Flanders 2009' we focus on some of the undesirable consequences of both threats in sociological research. By applying Multiple

Correspondence Analysis (MCA), we show that people with different sociodemographic backgrounds differ in their understanding of 'sport', implying that the measurement, as it is

used now, lacks validity. Suggestions on how to collect valid data on sport participation are presented.

## 11\_07JS28 - Sports and Culture: Participation Alike?

Chair(s): Koen Breedveld (WHJ Mulier Instituut, the Netherlands)

### Athletics and Aesthetics: on Differences and Similarities between Sport and Culture

Koen Breedveld, Mulier Instituut | [k.breedveld@mulierinstituut.nl](mailto:k.breedveld@mulierinstituut.nl)

Judging by some of the media-stereotypes, those with an interest in sports (the athletic ones) generally are rather different, and in fact quite the opposite, from those that are primarily interested in culture (the aesthetic ones). But how correct is that image? To draw attention and to send a clear message, mass-media have no choice but to blow up stereotypes. Real life though, is never in black and white, but rather in (fifty?) shades of grey. In this paper, we will analyze both the worlds of culture and of sports, to explore to what extent and in what ways both worlds are in fact, quite similar. Relying on a combination of empirical data, literature-study and media-analyses, we will argue that sports and culture have much in common, on quite a number of levels (historically, politically, economically, culturally and socially). Both rely heavily on

government support and face similar difficulties in attracting new audiences, esp. amidst the lower social classes. From thereon, we will turn to two influential changes in society, the rise of an 'experience economy' and the advent of a 'multi-cultural society'. We will show how these developments offer new opportunities for both worlds, and at the same time, pose formidable challenges. At no point in time were there so many other possibilities, temptations for people to invest their precious time in. In addition, the experience economy draws the two closer to each other as they have ever been. In order to maintain levels of participation and interest from the crowds, a common strategy, a sharing of expertise is called for, and an acknowledgment that in fact sports and culture are more alike than the media suggests us.

### Practicing, Visiting and Following; Differences in Participation in Sports and Culture.

Annet Tiessen-Raaphorst, Netherlands Institute for Social Research | [a.tiessen-raaphorst@scp.nl](mailto:a.tiessen-raaphorst@scp.nl)

Andries van den Broek, Netherlands Institute for Social Research | [a.van.den.broek@scp.nl](mailto:a.van.den.broek@scp.nl)

Cultural participation and sports participation have much in common. Both culture and sports can be enjoyed as visitor or spectator, both

either by going to venues where arts and sports can be seen or through the use of media. Both can also be actively practiced for

leisure, in which case one is either an amateur artist or an amateur sportsperson, if not both. Not all within the population engage in all leisure activities, and not all segments within the population do so in equal measure. This paper sketches and compares cultural participation and sports participation in The Netherlands, based on brand new data that were collected in autumn/winter 2012/2013. It compares levels in participation (do as many

people take part in sports practices as in cultural practices, or vice versa?) as well as patterns in participation (to what extent are these practices related to such characteristics as age, gender, educational attainment). The paper also addresses to what extent and by whom cultural participation and sports participation are combined at the individual level.

## **Cultural Capital, Family and Sports: Intergenerational Reproduction of Leisure Sports in Context of High-Brow Culture Activities**

Ondřej Špaček, Charles University, Prague | [ondrej.spacek@fhs.cuni.cz](mailto:ondrej.spacek@fhs.cuni.cz)

Empirical studies of social differentiation of leisure sports participation show its profound similarities with culture activities (e. g. Stempel 2005, Warde 2006). Intergenerational transmission of leisure patterns between parents and children (see e. g. Engström 2008) could be understood as a key mechanism capable of uncovering the nature of this relationship. In this context, a question arises whether the connection between sports and high-brow cultural participation stems from an actual position in a social space (i. e. Bourdieu's class homology), from class-based habitus acquired during the childhood

(Bourdieu 1984) or whether it is the result of a reproduction of autonomous family leisure cultures (see Birchwood 2008). A structural equation model will be applied on a recent representative survey data of the adult Czech population (dataset TSSM 2009). Different models of intergenerational transmission of sports participation will be assessed in the context of respondent's past and present social position and the participation in high-brow cultural activities. The study will discuss the role of the family milieu in the relation of sports and culture activities.

## **12\_15JS28 - Glocalisation, Cosmopolitanism, Nationalism and Sport (1)**

Chair(s): Renan Petersen-Wagner (University of Durham), Angel Manuel Ahedo Santisteban (University of the Basque Country)

### **Is Nationalism the Hegemonic Discourse? The "Empty" Nationalism in Sport and in Other Cultural Fields.**

Dieter Reicher, University of Graz | [dieter.reicher@uni-graz.at](mailto:dieter.reicher@uni-graz.at)

Modern professional sport is dominated by sport-events based on international competitions like the Olympic Games or the World Cup. Above all, in the mass-media

merely all sorts of sport are interpreted as competitions between nations; even the UEFA Champions League or Formula-1-races. An empirical analyses of the newspaper-coverage

of the Olympic Winter-Games from 1932 to 2006 demonstrates that nationalism once was of minor importance. Nowadays, it becomes the hegemonic discourse. This is true not only for the coverage of the sport-events but also for many other newspaper-reports about politics or society during the Olympic Winter Games. The paper also discusses that this kind of sport-nationalism has a certain characteristic that distinguishes it from older forms of „romantic“ nationalism. Sport-nationalism in relation to international sport-competitions does have a strong ethnic-related content. Here, not the pathos of ethnic-uniqueness

prevails but that of being „better“ than others in fields of accepted „world culture“. The paper also shows that this kind of ethnic „empty“ nationalism can also be found in other areas of the mass-media like the coverage of film-prizes (the „Oscar“), international beauty-contests, nobel-prizes etc. The study includes also the analyses of internet-fora related to such kind of topics. It can be shown that sport-nationalism coins the „empty“ nationalism in other fields of culture. However, there, nationalism is not in the same degree „hegemonic“ as in the field of sport.

## The Impact of the Local Cross-National Relations on the Olympic Games

Larisa Vdovichenko, Russian State University for the Humanities | [vdlarissa45@yandex.ru](mailto:vdlarissa45@yandex.ru)

This paper presents a sociological analysis of impact of local cross-national relations on the Olympic Games. Preparation and success of Olympic events deeply depends on stability and dynamics of local cross-national relations in the Region of its residence. I'll try to give certain contribution that looks into the role of national factors and characteristics of local cross-national relations in preparation of the 2014 Winter Olympic Games in Sochi. Caucasian Region is characterized by multinational population with very long and complex history. Contemporaneous situation is also not simple. Chechen War, terrorist attacks and other frictions between different nationalities impacted negatively on the situation in the Region. Nowadays federal and local Powers try to put an end to negative consequences of last events and to change the

context of political life and conditions in which conventionally local political decisions are considered and made. From the other side sport contains reserved possibilities of cooperation and solidarity. How the Olympic project ensures positive changes in cross-national relations? Could the preparation and carrying out Olympic Games facilitate the situation in the Region? The paper focuses attention on this background of the 2014 Winter Olympic Games in Sochi. My analysis builds on media accounts, interviews with officials from the Sochi 2014 Organizing Committee and data's of sociological monitoring of different materials. The paper gives the description of the situation before the 2014 Winter Olympic Games and provides useful information for an outlook necessary for the global Olympic Movement.

## Interdependence between Sports and World Society

Aleksander Zielinski, UPD Waldau | [milosz13@gmx.ch](mailto:milosz13@gmx.ch)

Ever since its beginnings in the late 19th century modern sports was closely linked to major societal developments in technology, politics, economy etc. Examples include the dominance of the nation-state as

administrative unit; the widespread use of technologies of mass communication like television or the fact that many countries boycotted the Olympic Games in 1980 and 1984 for political reasons. It is thus not surprising

that recent developments in society (e.g. the process of globalisation) have had a big impact on the domain of sports. At the same time the field of professional sports can be seen as a domain where future developments are being anticipated. Against this background I would like to present some autonomous but interrelated theses and illustrate them with examples from the last twenty years: 1) Politics: The erosion of the nation-state and the emergence and rising importance of supranational institutions like the EU or the WTO resulted in an increase of power for supranational organisations like UEFA, FIFA or the IOC. This will be discussed on the example of the rights to advertise on major events and

the implementation of the Maastricht Treaty via the „Bosman-verdict“ in the 1990s. 2) Economy: The growing dominance of Transnational Corporations in the global economy has led to the emergence of a number of teams which can be seen as „labels“ similar to Coca-Cola or McDonald's, like Bayern München or Real Madrid. People from all over the world (and not just Munich or Madrid) identify with these teams and their players. 3) Technology: The discourse on doping, including arguments for its necessity, can be interpreted as anticipation of the normalisation of the use of neuroenhancements in society

## World Culture, Sport and Nationalism

Dieter Reicher, University of Graz | [dieter.reicher@uni-graz.at](mailto:dieter.reicher@uni-graz.at)

Today, there are more national teams participating Olympic Games (202) or the qualifying round of the World Cup than there are members of the United Nations (193). It seems, every new nation-state has to have its national sport teams as symbols of sovereignty. Thus, nation-sport unifies what seems to be contradictory: world culture and nationalism, universalism and particularism. However, the modern sport system with its dominating mega-events that displays international prestige and nationalism is only one possible development of sport in the 20th

century. There were always alternatives in sport to the system of nation-sport. Some of them like traditional sports and ethnic related sport (like the German Turnen) were not related to cosmopolitanism, at all, but rather to a notion of cultural particularism. Thus, this paper investigates how it was possible that global culture and nationalism coined the modern sport-system. Above all, the paper discusses the characteristics of the sport related nationalism and what distinct this type of nationalism from other types.

## 13\_15JS28 - Glocalisation, Cosmopolitanism, Nationalism and Sport (2)

### Football Fans as Subcultural Actors of Glocalisation: Notes from the Field in Croatia

**Benjamin Perasović**, Institute of Social Sciences Ivo Pilar, Zagreb | [Ben.Perasovic@gmail.com](mailto:Ben.Perasovic@gmail.com)

**Marko Mustapić**, Institute of Social Sciences Ivo Pilar, Zagreb | [Marko.Mustapic@pilar.hr](mailto:Marko.Mustapic@pilar.hr)

One of the key effects of globalisation process is weakening of the nation state (Beck, 2000). There is also parallel process of glocalisation (Robertson, 1994). From the 1950-s, youth subcultural styles dispersed from anglo-saxon 'core' to various peripheries, contributing to our knowledge of global-glocal relation. Gulianotti and Robertson (2007) consider sport as clear example of interferences between globalisation and glocalisation, and Pilkington (2004) emphasized the importance of youth cultural strategies that manage glocal lives. Within the history of European modernisation processes, Croatian society was always at the periphery. Croatian transition was determined by the Homeland war 1991-1995 (Rogić, 2000). Our research is a part of FP7 project MYPLACE. Main method was ethnography (9 months of field work, extensive diaries, 25 in-depth interviews with core members of

Torcida), and the aim of this study is to explore football fans subculture in Croatia and its role in glocalisation process. Subculture of football fans became topic of sociological research in the second half of the 1980-s. One of the main characteristics of Torcida is passionate involvement in construction of Croatian national identity, with the emphasis on the Homeland war. Our research showed that the spectrum of meanings of national identity within Torcida goes beyond dichotomy 'nationalism vs. globalisation'. The play with ascribed and achieved identities within the subculture of the fans indicates multidimensionality of the glocal life. Good example is relation of Torcida to Croatian football federation, UEFA, FIFA and boycott of the national team during qualifications for the World Cup 2014.

### Do Sports Audiences Shift their Attention more and more to the "Transnational" Level?

**Michael Mutz**, Georg-August University, Göttingen | [michael.mutz@sport.uni-goettingen.de](mailto:michael.mutz@sport.uni-goettingen.de)

Processes of globalisation have become one of the most popular topics of various social science disciplines, not least sport sociology. Globalisation becomes particularly visible in professional sport, e.g. in form of player migration, international sports governance or global sport events. Some scholars thus argue that professional sport has yet become one of the driving forces of globalisation. However,

sports audiences are a less thorough researched subtopic within this field. Do sports audiences gradually shift their attention away from domestic sports leagues and sport events? Are audiences more interested today in leagues, competitions, or athletes from foreign countries? By using European football as an example, the paper analyses inasmuch sports audiences are becoming more and more

“transnational” in terms of their awareness and attention towards football leagues and football clubs. This presumed shift of attention from domestic clubs to expatriate clubs is empirically investigated with the help of google search statistics. Queries made by a person in country A but addressing a football club in country B, C, D etc. can be regarded as expressions of transnational attention. These “transnational” google queries are analysed systematically over a period of six football

seasons (2005/06-2011/12). Results indicate that the attention towards expatriate football clubs has indeed increased over time. Furthermore, the rise (and decline) of attention towards expatriate football clubs can be explained systematically, e.g. with the success of a club in a European competition. Findings from the world of football are thus backing the widespread notion that the significance of the nation-state is vanishing nowadays.

## Sport Mega-Event in Central-European Context: What is the Legacy of UEFA EURO 2012 in Poland?

**Agata Dembek**, University of Warsaw | [agata.dembek@gmail.com](mailto:agata.dembek@gmail.com)

**Renata Włoch**, University of Warsaw | [renatawloch@gmail.com](mailto:renatawloch@gmail.com)

The paper analyses the multidimensional impact of the third largest sport mega-event in the world UEFA EURO 2012 on Poland. Poland and Ukraine were granted the right to host the European Championships in 2007; for both countries it was the first event ever of this magnitude to organize. The paper will critically address the issue of legacy of the Championships in two chosen dimensions: political and social. From the political point of view the Championships were the situation of quickened learning of the new global rules of interaction for the Polish government; it had to learn how to negotiate the rules of engagement and the borders of its sovereignty with one of the most powerful global governors (UEFA). It evoked the necessity of far-going structural, institutional and legal adaptations. In the area of social life the Championship

were used, mainly all by the third-sector organizations, as an opportunity to introduce and develop the issues of social integration, the condition of civil society, volunteering, the auto-perception of the Polish society and national sentiments, as well as sport-for-all. The main thesis of the paper is that the Championships, and UEFA itself, played the role of an exogenous stimulus, accelerating, on the one hand, the (somewhat painful) adaptation to the modus operandi in a globalized world for the Polish state, and on the other hand, creating a foundation and opportunity for quickened pace of social change. The argument will be based on the extended research carried in 2008-2012 by a think-tank Social Action 2012, affiliated at the University of Warsaw.

## 14\_04JS28JS30 - Facets of Participation in Childhood and Youth: Exploring Sport Participation (1)

### Selected factors Related to Participation in Sport and Physical Activities among Secondary School Students in the Island of Tobago

Anand Rampersad, University of the West Indies | [pastiche6@yahoo.com](mailto:pastiche6@yahoo.com)

This exploratory paper examines the relationship between selected social variables and participation in sport and physical activities among secondary school students on the island of Tobago, in the Caribbean. Participation in sport and physical activities involve engagement at school, organized clubs and recreational settings. The research explores the relationship between participation in sport and physical activities as it relates to Social and Economic Status (SES), engagement in extra-curricular activities, school encouragement and parental education. The study draws on an analysis of quantitative data of 116 secondary school students from four (4) schools in Tobago between the ages of 11-15 years. Using a number of statistical tests such as Spearman's rank correlation, the data

shows that there are no positive relationships between school encouragement, SES, parental education and participation in sport and physical activities. Additionally, there is no statistically inverse relationship between engagement in extra-curricular activities and participation in sport and physical activities. The findings of the study calls for a deeper understanding of the meaning and prioritising of sport and physical activities in a small developing society. In so doing, recommendations are offered for future research as well as policy planning in order to make meaningful interventions in the lives of adolescents in terms of their health and socio-cultural well being. Keywords: Participation; Sport; Small Developing Society

### Conforming or Countering Femininities? Secondary School Sport

Majella McSharry, Dublin City University | [majella.mcsharry@dcu.ie](mailto:majella.mcsharry@dcu.ie)

This paper is based on research conducted in a range of Irish second level schools selected because of their reputations for success in rugby and Gaelic games. Sport is frequently seen as a source of hope and cohesion, strengthening community belonging among participants and supporters. However this research examines how school sport can be alienating and infuriating when it serves to reinforce gender inequalities, while giving the illusion of 'natural' gender practices. In Ireland, whatever the team sport, it is predominantly men's leagues and competitions

that attract most media support and public interest, so physical team sports are largely gender specific and male orientated. This dominance is often nurtured and perpetuated in secondary schools whose reputations depend on the success of boys' teams. This research investigates the experience of girls attending these schools. It is framed against the backdrop of varying studies that document high levels of sport 'drop out' amongst teenage girls (Kelleher et al, 2003) or lack of participation in diverse activities (McPhail, Collier and O'Sullivan, 2009). This paper

explores the range of co-curricular sporting activities available to girls and suggests that equality of choice can serve to highlight rather than reduce gender dissonance. This paper examines how ultimately the girls' quests for

equality and recognition within school sport can leave them balancing a fine line between conforming and countering discourses of gender performativity.

## **Non-Disabled Secondary School Children's Lived Experiences of a Wheelchair Basketball Programme Delivered in the East of England.**

**Adam B. Evans**, University of Lincoln | [adevans@lincoln.ac.uk](mailto:adevans@lincoln.ac.uk)

**Lindsay J. Brown**, University of Lincoln | [lbrown@lincoln.ac.uk](mailto:lbrown@lincoln.ac.uk)

**Jonathan Bright**, University of Lincoln | [jonobright86@gmail.com](mailto:jonobright86@gmail.com)

Frequently an unquestioned belief is held in UK schools in the value of 'normalised' ability in physical education. Consequently inclusion of disabled students can be problematical. Negative perceptions of disability are rarely challenged. This study investigated the embodied experiences of 50 non-disabled secondary school pupils during a programme designed to introduce disability sport to non-disabled schoolchildren entitled 'The Wheelchair Sports Project.' Wheelchair Basketball sessions were delivered by coaches during physical education for a 12 week period. 50 pupils aged between 10 and 12 years took part. Non-participant observations were completed during the intervention and guided group interviews were completed with 40 participants pre and post project. Bourdieu's theoretical framework was utilized during data analysis. The impact of the project on pupils'

perceptions of physical disability was investigated. Prior to the project, pupils emphasized the 'otherness' of disabled bodies and described disability sport as inferior and not 'real.' Observations highlighted how pupils' experienced physical challenges adapting to wheelchair basketball. Pupils struggled to control wheelchairs and frequently diverged from acceptable behaviour by using their lower limbs to 'cheat.' Post-programme interviews demonstrated pupils' perceptions of physical disability altered due to their embodied experiences. Pupils described high physical demands of wheelchair basketball and began to focus upon similarities between themselves and physically disabled individuals. However, no reference was made to mental or psychological disability, emphasizing the specificity of the effects of pupils' embodied experiences on their habitus'.

### The Sport and Physical Activity Drop Out Phenomenon – Concepts, Methodological Issues and Airections for Future Research

Matti Hakamäki, LIKES Research Center, Jyväskylä | [matti.hakamaki@likes.fi](mailto:matti.hakamaki@likes.fi)

There is a consensus regarding dropout from organized sport in general; however, the phenomenon is seldom investigated in detail. Beginning, changing and withdrawing from a specific sport can be measured using the license data of sports federations in countries where such information is available in a suitable format. The basic feature is that although children will drop out of sports at any age, starting a new one becomes more difficult as they get older. The declining amount of physical activity is a parallel but slightly different issue; the decline starts earlier. According to currently available data, the level of objectively measured physical activity starts to decline after children reach the age of seven. Organized sport is only a small fraction of the total volume of physical activity. From the health behaviour perspective, the organization mode of physical activity is

important because it affects the probability of an active lifestyle in the future. Amounts of physical activity are traditionally measured using questionnaires; currently, the data is also objectively gathered with accelerometers. The research method affects the results; the interpretation of associations between socioeconomic factors and physical activity is influenced by the chosen method of data collection. Sport-related behaviour can be understood as a consumption style ; to some extent, this behaviour is dependent on available resources. On the other hand, several aspects of consumption are more immaterial, and some features can be adapted to circumstances where only scarce funding is available. The consumption styles may be independent of participating self in sport in the form of physical activity .

### Sports Participation, Family Habitus and Gender : a Case Study of Sporty Girls and Non Sporty Boys

Christine Mennesson, University of Toulouse | [christine.mennesson@univ-tlse3.fr](mailto:christine.mennesson@univ-tlse3.fr)

Numerous works highlight the role of the socioeconomic status of families in children's participation in sports (White and Pledge, 2007; White and McTeer, 2012). Other authors studied the modes of family socialization which favor this process. The family culture so appears as a central element in the construction of the childrens' sports tastes (Wheeler, 2012 ; Dagkas and Quarmby, 2012). In particular, the place occupied by sport in the

family style of life plays an important role (Macdonald and al. , 2004). More generally, it is possible to identify a family habitus (Tomanovic, 2004; Weininger and Lareau, 2009), who organizes children's engagement in leisure and physical activity. However, the sports participation of childrens also varies according to their sex. If sports participation seems more valued for the boys, and allows them to occupy a favored place in their group

of peers (Eder and Kinney, 1995), the atypical sports investments are less negatively judged for the girls (Messner, 2005; Mennesson, 2007). This communication discusses the interest of an analysis in term of family habitus to analyze the atypical gender uses of sport of certain

children. It bases on a qualitative survey led with about twenty children's families, and presents in great detail the cases of two girls practising sport in a intensive way, and of two boys who doesn't like sport.

## The Phenomenon of Drop Outs Sports among Teenagers. A Case Study in Italy

Barbara Mazza, University of Sapienza, Rome | [barbara.mazza@uniroma1.it](mailto:barbara.mazza@uniroma1.it)

Between 14 and 18 years there has been, in Italy, the highest rate of abandonment of sport and amounted to over 20% (Istat 2010). What are the factors that have the greatest impact on this choice? To investigate the reasons, ORSA (Regional Observatory sports Abruzzo) on behalf of CONI Abruzzo has conducted in 2012, a research involving nearly 10,000 high school students (equivalent to 20% of the student population of the region), distributed by type of school attended, gender, age, province of residence, to ensure the representativeness of the sample. The survey examined by administering a semi-structured questionnaire and the construction of four focus groups (one in each province of the region), motivation, socio-cultural, lifestyle and eating habits, relationship with individual

sports, relationship dynamics and patterns of cultural consumption. The reflection emerged is part of the debate, for some time, has suffered as a national and international level. The aims to understand the reasons that lead to inactivity and neglect, but also to identify possible actions to intervene in order to help contain the phenomenon of drop outs. The results have been demonstrated fully in line with the national data and made it possible to provide a detailed and multifaceted condition and habits of young people of Abruzzo, in addition to interesting ideas that come from the way they conceive of the sport and their requests to the sporting world, aimed at dialogue and make it more challenging approach to physical and motor activities.

## 16\_04JS28JS30 - Facets of Participation in Childhood and Youth: Exploring Sport Participation (3)

Chair(s): Tom Cockburn (University of Bradford), Leena Haanpää (University of Turku), Aurelie Mary (University of Tampere)

### Urban Youngsters and Organised Sports. Relations between Socio-Demographic Characteristics and Drop Out.

Tineke Van de Walle, Ghent University | [Tineke.VandeWalle@UGent.be](mailto:Tineke.VandeWalle@UGent.be)

Lieve Bradt, Ghent University | [lieve.bradt@ugent.be](mailto:lieve.bradt@ugent.be)

eva de coninck, Ghent University | [e.deconinck@ugent.be](mailto:e.deconinck@ugent.be)

Participation in organized leisure activities is believed to bring substantial developmental benefits for young people. Participation in organized sports in particular has not only been associated with general developmental benefits, but also with better health in young people. As a consequence, there is a growing interest in the non-participation and drop out of young people in organized sports. While research data are available on the socio-demographic characteristics of 'non-participants' and on young people's main reasons for dropping out, few studies have focused on relations between youth drop out and socio-demographic characteristics. In our presentation we will present findings based on multilevel data from a school survey conducted by the Youth Research Platform, a Flemish Policy Research Centre, in secondary schools

in the two biggest cities of the Flemish region of Belgium. The sample includes 3.867 young people, aged between 12 and 18 years old and from diverse socio-demographic backgrounds (half of the respondents come from ethnic minority families and over 10% of the respondents reported financial strain in their family). All respondents had to report on their former and current participation in organized sports and other leisure time activities. Multilevel logistic regressions uncover compound relations between drop out, age, gender, ethnicity and socio-economic status. Our findings suggest that different explanations for youth drop out in sports are to be found in different sections of the population, notwithstanding possible invariance in self-reported reasons.

### Ethnic Minority Youth and the Access to Participation in Organised Sports: Danish Case: The Intervention Playground

Annette K. Michelsen la Cour, University of Southern Denmark | [amlacour@sam.sdu.dk](mailto:amlacour@sam.sdu.dk)

From 2010-2012 an intervention named Playground offered sporting activities during vacation periods in 6 disadvantaged areas in Denmark. The Ministry of Culture was behind the funding and the intervention was organised

by the Danish sporting umbrella organisation DGI and carried out by local sports clubs. The political aim was to reduce crime and political radicalisation through meaningful organised activities, though the aim of the local

sportsclubs was to attract new members among the children and young people between the age of 5 to 16. The political expectation was, that a variety of sporting activities offered ranging from football across cricket to capoeira, belly dancing and fencing would present an important alternative to doing nothing or engaging in criminal activities during vacation periods. The intervention was evaluated and the findings showed that the aim of reducing "trouble" was met through the activities and it was believed that the activities could prevent gang-like constellations from recruiting new members. The activities were well attended by children up to the age of 14

years and approved by both children and parents after a period of introduction, but the participants did to a very little extend enrol as members. The sports clubs though did not gain a lot of new members, but became known in the areas. The findings also showed that participation in organised sports is limited for both financial, social and cultural reasons and that the knowledge of the civil society based sports clubs in Denmark is at hand but not at use. There's a substantial underrepresentation of ethnic members and the findings showed that means of transportation and parental resources are scarce among the families in the areas.

## Children and the Federal Definitions of Sports Activities in France

Pascale Garnier, University Paris 13 | [pascale.garnierx@free.fr](mailto:pascale.garnierx@free.fr)

Sports practices must be understood as the relationship between two phenomena: on the one hand a "demand" of practices; on the other hand an "offer" of practices (Bourdieu, 1980). In particular, the participation of children and young people in sports organizations can be explained by various factors such as time allocation, but also by the social definitions of sports practices according to age groups. These aspects, in the French context, constitute the object of my proposal, insisting on a tension between recreational and competitive definitions of sports. The objective is to show an increasing emphasis on the selective and competitive dimensions of organized sport compared to the dimensions of leisure and play. In order to analyze this general process and its variations according to different sports, I study the development of five

sports activities within the framework of national federations: basketball, gymnastics, horse-riding, tennis, swimming (Garnier, 2005, 2006). The aim of my communication is to contribute to denaturalize the classifications of age, which are particularly powerful in this domain of physical activities. References

## Learning to Associate: The Facilitators and Obstacles to BME Children and Young People's 'Participation' in Sports Associations.

Tom Cockburn, University of Bradford | [t.d.cockburn@bradford.ac.uk](mailto:t.d.cockburn@bradford.ac.uk)

This research explores the work of Black and Minority Ethnic (BME) children's and young people's association through the lens of sports associations. The research: a) Illuminates how BME young people's social identities are produced and negotiated in families and in private and in public spaces/places; ii) Understands how such learnt patterns of association in the informal sphere develop into

more formal associations; iii) Sports participation is a key element in supporting BME children to negotiate the interface between 'informal' and 'public' association. We adopt an intensive case study approach utilising semi-structured interviews, PLA techniques of network mapping (Chambers, 2009).

## 17\_11JS20JS28 - Emotions, Objectification and Reflexivity in Qualitative Body and Sport Research (1)

Chair(s): Monica Aceti (University of Strasbourg), Katarina Jacobsson (Lund University), Haifa Tlili (Paris Descartes University)

## Coming to a Moving Body: Methodological Grapplings

Judy Davidson, University of Alberta | [judy.davidson@ualberta.ca](mailto:judy.davidson@ualberta.ca)

Angela Meyer, University of Alberta | [ammeyer1@ualberta.ca](mailto:ammeyer1@ualberta.ca)

Randi Nixon, University of Alberta | [rlnixon@ualberta.ca](mailto:rlnixon@ualberta.ca)

In this project, we seek to hear from and move with those people who would describe themselves as having been alienated from their moving bodies for most of their adult lives, and work with their kinesthetic and affective experiences (struggles, successes, failures, etc.) of coming to movement as adults. The project is inspired by Davidson's late partner, whose trauma history seriously hampered her embodied movement horizons. This paper will grapple with how one not only addresses the discursive effects of biographical histories, including legacies of ethnocentric, sexist, homophobic, and fat phobic physical education/activity instructional spaces (Sykes, 2011), but also query how affect

contribute to kinesthetic experiences of movement. We will stretch the frame of participant observation to participant participation with the researcher – wherein research participants will be invited to move with a researcher, narrating their in-process, embodied experience. We will think through the dialectical relationship between a skilled mover and an unskilled mover, between someone who struggles with an alienated moving body relationship and a more conventionally skilled athletic body. How does a researcher's investment in being an already confidently embodied subjectivity impact the relational, participative movement and moment – where an adult neophyte mover

narrates and does movement. Questions we will address include: How does hegemonic doxa about presumed movement patterns, knowledges and abilities subjectify bodies that experience themselves as alienated from

conventional, taken for granted movement capabilities? How might those alienated movers move dialectically with a different kind of approach to movement pedagogy?

## When Research Calls in Question the Body. Am I an “Able People”?

Rémi Richard, Paris Descartes | [richardremi@hotmail.fr](mailto:richardremi@hotmail.fr)

Does the “not-disabled” researcher have any legitimacy to speak about the body experience of people presenting a physical impairment? For the most radical activists of disability studies, the answer is obvious: to speak about disability, it is necessary to have lived it (Oliver, 1990). Nevertheless, my two years spent in the clubs of powerchair football (the only team sport proposed to people using daily an electric wheelchair) led me to rethink the apparently immense difference, between the “abled people” (“valides” in French) and the “disabled people” (“handi” in French). As my interviews and my investigations on the field progress, the players made me realize that I was not an “abled” (valide), without being a “disabled” (handi). During the data analysis, I realized that I am in a liminal situation (Van Gennep, 1981). I understood, a posteriori, that because of my professional background in a special

institution for disabled people, I am not considered as an “abled” by the powerchair football players without being a “disabled”. The aim of my communication will be, at first, to expose the reflexive processes, which bring me to rethink my “abled people” (valide) position. Then we will see that this position of “not really abled” (pas tout-à-fait “valide”), which was originally unconscious, allowed to lead my research in a privileged way, particularly in giving the possibility of sharing the sports experience of the body in a powered wheelchair. Oliver, M., 1990. The politics of disablement. London: MacMillan. Van Gennep, A., 1981. Les rites de passage: étude systématique des rites de la porte et du seuil, de l'hospitalité, de l'adoption, de la grossesse et de l'accouchement, de la naissance, de l'enfance, d

## Careers of Sociologist in Sport: Epistemological Essay of How Things Intertwine between Subjects and Objects.

Haifa Tlili, Paris Descartes University | [tlilihaifa1@gmail.com](mailto:tlilihaifa1@gmail.com)

Monica Aceti, University of Strasbourg; IUHMSP-CHUV Lausanne | [monica.aceti@unifr.ch](mailto:monica.aceti@unifr.ch)

The objective of this work in-progress is to light up research in the sociology of sport activities. Sport sociologists' career is analyzed as per Becker's method, considering at the same time the objective dimension (status, career plan), the subjective dimension (intimate meanings, emotions, strategies and hurdles) and the diachronic dimension (linear evolution of the career or junction). In the feminist thinking, the normality of “axial

neutrality” is questioned. In order to generate a typology of sociologist career, we cross different methods: directed and informal interviews, reflexive work of writing and an autobiographical exchange platform. There are 2 steps for this field study: First, a methodology is tested with a small group of researchers by the way of exploratory exchanges about personal and professional background. Doing so, a forum for exchange is

created allowing to roll out our own careers recollecting personal ethnography and coming to the realization of the many undertakings that might interfere in the structure of our sociological research and its implementation (whether political, institutional, professional, biographical, familial or intimate). In parallel of this reflexive exercise of objectification, direct interviews with sociologists in sport are conducted to understand how they are doing

their work as they are themselves involved in situ and belong to the social environment they are studying. For this paper, we will analyze verbatim of sport sociologist, most known in France, with different speciality (specialist of gender studies, queer studies, socio-politics studies, in philosophy, in critical studies, in quantitative studies, in ethno-phenomenology or in ethnomotricity).

## The Challenges of Conducting Qualitative Research into the Experience of Female Football Fans

Caroline Dunn, Regent's College, London | [dunnc@regents.ac.uk](mailto:dunnc@regents.ac.uk)

This paper outlines the methods I used to conduct my research into the experience of female football fans in England. It begins by setting the historical context of research into fan experience, which has long depended on participant observation; and it explores the reasoning behind the selection of a questionnaire as a 'development stage', proceeding to one-to-one interviews with each respondent. It goes on to examine the concepts of 'narrative' and 'memory' as they relate to the respondent's part of the interview, and the challenges they represent. It discusses whether or not completely 'accurate' accounts can ever be elicited – and if so, if that should

matter to the researcher. The paper then puts forward the argument in favour of the researcher positioning herself reflexively and critically, accepting and acknowledging her biases and preconceptions by invoking the concept of the 'aca-fan', as put forward by Jenkins and Hills. It assesses the difficulties of a researcher interrogating a fandom they share, and highlights some examples of how this was encountered in my own research. It concludes that there is no such thing as a 'perfect' piece of research: a social scientist can never be entirely objective and detached from either her respondents or the data elicited.

## Writing Graffiti - Risks and Chances of 'Ethnographic Life-World Analysis'

Paul Eisewicht, Karlsruhe Institute of Technology | [paul.eisewicht@kit.edu](mailto:paul.eisewicht@kit.edu)

The 'Ethnographic Life-World Analysis' developed by Anne Honer is an outstanding approach to field research. Rather than

participant observation it favors observational participation (which means the existential involvement of the researcher in the field). In

doing so, the aim is to reconstruct: a) the guiding subjective knowledge of the agents in the field and furthermore b) the typical experience of the specific small life-world [which in accordance to the Social Phenomenology of Alfred Schütz is bound to emotions]. By this guideline, the subjective and emotional connection of the researcher to the field becomes constitutive for his scientific work as a basis for the analysis rather than a contamination that has to be avoided (in other words: it turns the unavoidable problem of the researcher in the field in a productive way for sociological insight). The talk focuses on the practices of the Ethnographic Life-World Analysis and the risks and chances of this approach using the example of a research

project about learning in youth cultures. The research question is: how do people gain skills in informal settings in the case of the graffiti scene. Writing Graffiti as an activity involves various meaningful actions (e.g. observing, climbing, writing, running, even self-defense) that has to be understood in relation to the subjective motives and the personal emotional experience in the situation. Using this project as an example this talk addresses: a) the use of the researcher's experience as a participant, b) the triangulation of observational data and c) the problems with ethnography in deviant fields, which challenge the balance between scientific insight, ethical principles and the trust of the research subject.

## **Conducting Research in Egypt before and since the Revolution. How Does the Researcher Deal with Personal Emotions, Violence, and Gender Issues?**

Chaymaa Hassabo, Collège de France, Paris | [chaymaahassabo@gmail.com](mailto:chaymaahassabo@gmail.com)

Since January 25th, 2011, a revolutionary process has began in Egypt. Within this context, several new political and social actors have emerged, allowing entirely new interactions in society to take place. Some of these interactions have taken a violent turn, especially, those involving the confrontation of « revolutionaries » with security forces (either of the army or of the police). This new context has made apparent inevitable political divisions amongst the Egyptian people - sometimes even within families - between pro-revolutionary and anti-revolutionary factions. Before this new political context, I have pondered over some of these relational dynamics when working on issues that implicate personal, ideological or generational conflicts of interest (the case of Egyptian young political activists for example). What initially appear as « problems » that could hinder the objectivity of

the research, eventually became the fruitful resources that helped enrich my fieldwork. Today, the personal implications of the researcher are again questioned because of the overwhelming, unprecedented political situation. However, several questions come to light that need to be addressed with regards to participatory observation: How does a researcher deal with such situations? How can personal emotions and ethical issues effect - either positively or negatively- ongoing or past research? What gender-specific problems arise when doing research in the current male-dominated situation that poses restrictions on the physical presence of the female researcher in some circumstances (the events involving the Football Ultras are a case in point, but the question also pertains to violent mass demonstrations in general)?

## Speaking With(in): Embodied Reflexivity & Embodied Knowledge

Jessica M Francombe, University of Bath | [jmf22@bath.ac.uk](mailto:jmf22@bath.ac.uk)

Emma Rich, University of Bath | [E.Rich@bath.ac.uk](mailto:E.Rich@bath.ac.uk)

Laura De Pian, University of Bath | [L.De.Pian@bath.ac.uk](mailto:L.De.Pian@bath.ac.uk)

Predicated upon our desire to destabilize any notion of “axiological neutrality” within qualitative research on the (moving) body we examine how our own researcher bodies come to bear across the spectrum of the research process. We engage the cultural identities of ourselves and the individuals we encounter through author body-narratives derived from three separate research studies all of which focus on our biopolitical subjectivity in some way. These narratives point towards the corporeal contradictions of being located within a culture of reading and critiquing bodies while realising our own trajectories as a somewhat complex set of assemblages. They advance a politics of reflexivity that shed light on how we experience, make claims and speak about others as bodies made known through our own bodies which are always in a process of becoming (Coleman, 2008). We consider

speaking with bodies, highlighting the challenges of moving beyond taken-for-granted body knowledge when our physicality legitimises bionormality. We tussle with the vulnerability our subjectivities evoke, we question our responses when our corporeality is silenced and we problematize our ability to engage in border crossing within particular communities when the body and embodied knowing complicates the process. Whilst much has been written about intersubjectivity of data collection and the politics of representation and voice, we advocate for the extension of this reflexivity in relation to the lived embodied experiences of researchers’ presentation and dissemination of their work across public and academic context. Doing so means understanding not what researchers’ bodies might signify, but what they do relationally in the constitution of knowledge.

## Shadow Boxing among the ‘Pro’s’: Autobiography, Embodiment and the Crafting of ‘Insider’ Understanding among Amateur and Professional Boxers in England.

Alex Stewart, University of Bedfordshire | [alex.stewart@beds.ac.uk](mailto:alex.stewart@beds.ac.uk)

This paper focuses on the practice and production of what is often termed ‘insider ethnography’ or ‘ethnography at home’, or qualitative research carried out in cultural settings intimately familiar to the ethnographer prior commencement of fieldwork (O’Reilly 2012). Following this methodological vein I conducted ethnographic fieldwork over a five-year period among amateur and professional boxer’s based in Luton and London, England (Stewart 2008). More to the point, having accumulated many years experiences as a competitive boxer prior to my scholarly endeavour, I ventured into the field enamoured with a belief that being able to

‘talk the talk’ and ‘walk the walk’, be a ‘real’ boxer among the boxing-practitioners studied, I could bodily and intellectually capture other boxer’s reality vantages from a somehow more culturally nuanced and intuitive position of knowing. Whatever suppositions I may have harboured at that time, however, it is safe to say that as a neophyte researcher I had little, if any, appreciation of the intellectual, physical and emotional turmoil I was to experience as I reflexively grappled with issues of strangeness and over-identification in both the field as ‘the boxer’ and the library as ‘the researcher’ writing-up and amending the thesis. The discussion henceforth is thus mindful to convey

something of the messy and emotionally draining ethnographic journey realised and the necessity of questioning and drawing upon one's evolving 'fieldworker self' in order to

bring autobiographical and embodied sense-making assumptions and intuitions to consciousness.

## 19\_28JS33 - Gender and Sexual Harassment at Work and in Leisure Time (Sport)

Chair(s): Kari Fasting (Norwegian School of Sport and Physical Education), Maria Carmela Agodi (University of Naples "Federico II")

### Competing Discourses in Estonian Nurses' Talk: Professionalism, Gender and Power

Katri Lamesoo, University of Tartu | [katri.lamesoo@ut.ee](mailto:katri.lamesoo@ut.ee)

Raili Marling, University of Tartu | [raili.marling@ut.ee](mailto:raili.marling@ut.ee)

Thus far there have been carried out number of studies on sexual harassment that operate in discursive framework. However, although there is an increasing number of studies analyzing how sexual harassment is discursively constructed, there are fewer studies that would consistently attend to the relevant social knowledge such as norms and values as well institutional or organizational structures of the given context. Therefore, insights primarily from feminist post-structuralist discourse analysis (FPDA) were employed for analyzing 21 interviews with Estonian hospital nurses on the topic of sexual harassment. The approach is suitable for the present study because of its attention to the micro-analysis of discourse and the multiple positioning of speakers and their complex negotiation between different subject positions. As Baxter (2003: 49) puts it, 'Speakers are able

to take up, accommodate or resist relatively powerful or powerless subject positions made available within competing discourses at work within any given moment'. Although feminist scholarship has importantly demonstrated the extent to which women have been disempowered, this should not be taken as universal assumption, but be tested in each social context. Power is always gendered but in a dynamic and multi-faceted fashion. Today's women negotiate their gender and professional identities in complex modes. In the following analysis we seek to overcome the trope of female victimization that tends to prevail in studies of sexual harassment and, rather, focus on women's agency and the often ambivalent ways in which they reiterate or subvert scripts of gender. This analysis allows us to focus on differences between women and their experiences of gender and power

## Quality of Life Threats in Recreational and Competitive Sport

Jan Toftegaard-Støckel, University of Southern Denmark | [jtoftegaard@health.sdu.dk](mailto:jtoftegaard@health.sdu.dk)

Previous research has shown that personal issues (nutrition, injury, goals and expectations), coach-athlete issues (coach, coaching style, selection) and environmental issues (team atmosphere, support structures) are key determinants for stress, depression and illness in elite sports. In a large scale survey among 4,000 Danish athletes from recreational thru to elite sport a regression analysis show an increase in risk of self-

reported stress, depression or illness (SDI) by odds ratio 6,5 in elite sport compared to recreational sport. One in eight athletes reported SDI and highest associations are related to coach behavior. The key question for this abstract is to examine whether men and women are equally vulnerable to SDI at various sport levels and secondly what types of behaviors may pose the biggest threats to athlete welfare.

## Towards a Prevention Policy against Sexual Harassment and Abuse in Flemish Sport

Tine Vertommen, University of Antwerp | [tinevertommen@hotmail.com](mailto:tinevertommen@hotmail.com)

Kristine De Martelaer, Vrije University | [kdmartel@vub.ac.be](mailto:kdmartel@vub.ac.be)

Lore Vandevivere, International Centre for Ethics in Sports (ICES) | [lore.vandevivere@ethicsandsport.be](mailto:lore.vandevivere@ethicsandsport.be)

Whilst other (inter-) national sport governing bodies developed prevention strategies on sexual harassment and abuse in sport in the late 1990s or early 2000s, it was only recently Flemish authorities took action. One of the developed policy instruments is the flag system, an educational tool to assist sport stakeholders in the assessment of sexual behaviour involving children. The flag system is based on six assessment criteria: consent, equality, free will, age appropriateness, context appropriateness and self-respect. It gives a score on the six criteria and a global degree of seriousness (coloured flag from green, over yellow and red, to black) to assess

situations whereby children's sexual integrity might be violated. Each flag requires an appropriate reaction towards the victim, perpetrator and potential bystanders. This tool presents 30 situations in which sexual behaviour involving athletes are depicted, assessed and commented. It aims at raising awareness about sexual harassment, encouraging stakeholders to reflect on children's sexual integrity and empowering athletes to speak up about their experiences with unwanted behaviour. A critical evaluation of this tool and its position within the broader Flemish prevention policy will be given during this presentation.

## Narratives of Sexual Harassment Experiences among Norwegian Female Athletes

Kari Fasting, Norwegian School of Sport Sciences, Oslo | [kari.fasting@nih.no](mailto:kari.fasting@nih.no)

Trond Svela Sand, Norwegian School of Sport Sciences, Oslo | [t.s.sand@nih.no](mailto:t.s.sand@nih.no)

During the last few years a number of different approaches to sexual harassment research have been taken, from examinations of prevalence (Fasting and Knorre 2005), to investigations into athletes' perceptions, responses and coping (Volkwein et al. 1997, Fasting et al. 2002, Rodriguez and Gill 2011). Most of the studies on this subject thus far have used the passive voice, failing to acknowledge the social construction of the participants' own narratives. They have, in other words, been 'author-evacuated' (Geertz 1988). Interviews with athletes have been analyzed across cases, compared thematically, and reduced to categories-- thus ignoring the athletes' ontological reality or 'biographical time' (Corbin and Strauss 1987). The purpose of this paper is to present Norwegian female athletes' experiences of sexual harassment in

their own narratives and discuss how their stories can be explained. Two narratives are presented from an interview study among Norwegian sport students. The participants in the interview study were chosen based on their answers to a larger survey about gender relations in sports. The interviews lasted about one hour, and were transcribed and analyzed with the help of MAXQDA. The stories represented two different team sports. The women had experienced both verbal harassment and unwanted physical contact from their coaches. Their stories are discussed in relation to the 'grooming' process that often occurs before sexual harassment and abuse occur, and in relation to socio-cultural models that may explain the occurrence of sexual harassment in sport.

## RN28 - Poster Session

### Hungarian Organized Recreational Sport Program: Volunteers' Social Background, Sporting Habits and Sport Motivation

Nora Szilagyi, University of Szeged | [szilagyi68@gmail.com](mailto:szilagyi68@gmail.com)

Noemi Keresztes, University of Szeged | [tari@jgypk.u-szeged.hu](mailto:tari@jgypk.u-szeged.hu)

Balazs Kiss, University of Szeged | [ourshine@gmail.com](mailto:ourshine@gmail.com)

Renata Racz, Fontys University of Applied Sciences | [porkaszal88@gmail.com](mailto:porkaszal88@gmail.com)

Zsafia Razso, University of Szeged | [r.zsafia@freemail.hu](mailto:r.zsafia@freemail.hu)

Csaba Varga, University of Szeged | [csabav@gmail.com](mailto:csabav@gmail.com)

Social inequalities in sporting habits is an important field of the sociology of sport. The effect of social background in physically active lifestyle is well-known. The main goal of our

present study was to detect volunteers' social background and analyze their sporting habits and sport motivation. Self-administered questionnaires were used to collect data in

2010. Our sample was based on voluntary participants from three subsamples. Our program lasted four months and involved exercising 3 times a week (N=187, M: 43.48 years, S.D. 13.12 years). Questionnaires included items on sociodemographics, health behaviours, sporting habits and sport motivation. We experienced that volunteers consisted of a homogeneous group. 82.9% of them were women, 57.8% were qualified, 83% were married, 95% lived in city, 41.2 % were married and 69.5% were from middle class. Most of the respondents were inactive before the program (50%), but 41.9% of them took

part in regular physical activity. We found that regular physical activity was in significant relationship with qualification and household income. We found different relationship between social background, physical activity and sport activity. There were also differences in the most preferred sports between the age groups. We have found that in this life period sporting habits were less influenced by social influences than earlier so mapping the motivational structure is very important. Using factor analysis finally four factors were separated with good reliability values covering extrinsic and intrinsic motivations.

## The German Survey on Volunteering as a Data Source for Research on Sports Volunteering

Nicole Schmiade, Deutsches Zentrum für Altersfragen | [nicole.schmiade@dza.de](mailto:nicole.schmiade@dza.de)

Sports and exercise are not only the most frequent social activity (apart from family and job), but they also constitute the major area of volunteering in Germany. The purpose of this poster is to introduce the German Survey on Volunteering (FWS) and show the great potential of this data set for scholars in e.g. sports science and sociology. The FWS is a representative survey on volunteer work, honorary office and civic engagement of the German population aged 14 and older. It has been conducted in 1999, 2004 and 2009; data collection for the next wave is scheduled for 2014. Including about 20000 cases, the FWS provides a substantial database for the description of volunteering in Germany and allows to report in detail on participation among population groups and across regions. It is the basic instrument for social accounting on volunteering in Germany. FWS data contain

information on what kind of social activity respondents engage in and how much time they invest. It explores in great detail the characteristics of voluntary work in this area – including sports and activities, culture and music, health, school and kindergarten, political initiatives and more. Information is available on motives, function, remuneration, subjective importance, demands and support concerning the voluntary activity. The richness of the FWS data allows for the tackling of various research questions: first of all, descriptive findings on activity and volunteering in sports and exercise. Second, the characteristics of and conditions for voluntary work in sports can be explored in great detail. Due to the time-series quality, social dynamics can be captured and development can be compared to other realms of volunteering.

#### The Practicalities of Refusal: Subjectivity and the Circuit of Capital

Colin Cremin, University of Auckland | [c.cremin@auckland.ac.nz](mailto:c.cremin@auckland.ac.nz)

The paper considers how desire is sublimated in work and consumption regardless of whether a person is actually employed or can afford consumer products. It is this continuous bind to capital in the moments that value is created (employment) and destroyed (consumption), that the paper argues undermines the prospects and practicalities of what Marcuse termed a Great Refusal and Žižek a subtractive procedure. If the left is to provoke, in Badiou's words, new passions for the real, to what extent is this undermined by

individual necessity and jouissance in the endless quest to improve employability and acquire that perfect consumer product? Dialectically approaching the individualistic though materially necessary task of getting and sustaining a job or accessing goods and services that embody manufactured needs, the paper considers how passions of this kind can through resignification be channelled towards the kind of refusals and subtractions Marcuse and Žižek respectively envisage.

#### "Refeudalization": Foundations and Topicality of a Concept from Habermas's Social Analysis

Sighard Neckel, Goethe University, Frankfurt | [neckel@soz.uni-frankfurt.de](mailto:neckel@soz.uni-frankfurt.de)

This paper reconstructs the term "refeudalization" as introduced by Jürgen Habermas in his inquiry on the "Structural Transformation of the Public Sphere" and compares Habermas' analysis with the topical diagnosis of "postdemocracy" as described by Colin Crouch. The outcome of this reconstruction is an analytical concept of the "refeudalization" of modern society that describes a social dynamic of the present in which modernization takes place as a break in the continuity of the modern social order.

"Refeudalization" as a paradoxical mode of social change that leads to pre-modern societal patterns as a result of modernization is described in respect to four social developments: the organization of economic power in financial market capitalism, the emergence of an estate-based cementation of social inequality, the erosion of the performance principle and the reprivatization of public social policy in the form of donations and charitable foundations.

## Framing 'Commonalism': Towards a New Paradigm in Critical Theory?

Rudi Laermans, University of Leuven | [rudi.laermans@soc.kuleuven.be](mailto:rudi.laermans@soc.kuleuven.be)

Traditionally, the notion of 'commons' has been primarily theorised in economic terms. However, due to the writings of a.o. Antonio Negri & Michael Hardt, Paolo Virno, Massimo De Angelis and other authors influenced by the so-called post-operaismo movement in Italy, the concept has acquired a wider meaning and become the cornerstone of a new brand of critical theorising. The paper first outlines the principal stakes of so-called commonalism through a critical discussion of the two principal dimensions which this re-articulated notion of the common seems to imply. On the one hand, the term refers to generic human faculties such as thinking and communicating that are put to work in various forms of immaterial labor within the context of the post-

Fordist creative economy. They are understood as potentialities that are singularized through joint action, particularly through collaborative modes of producing surplus value within the new economy. On the other hand, the very same notion of the common points to the always singular collective product or 'common wealth' (Hardt & Negri) that is the outcome of the productive networking of individualized generic capacities. The second part of the paper discusses how this double coded notion of the common may be used to develop a new critical perspective on contemporary capitalism and neoliberalism. Particular attention will be paid to the way this emergent paradigm re-articulates Michel Foucault's ideas on biopower and governmentality.

## Structural Conflicts of Contemporary Capitalist Modernity

Craig A R Browne, University of Sydney | [craig.browne@sydney.edu.au](mailto:craig.browne@sydney.edu.au)

This paper seeks to develop the explanatory and diagnostic framework of Critical Social Theory through explicating three structural conflicts of contemporary capitalist modernity. It will be argued that these conflicts manifest themselves in the crises of contemporary societies and that each of the conflicts involves a specific order of social injustice and domination. The transformation of the structural conditions that generate these conflicts would substantially contribute to social emancipation. These three conflicts are intersecting and mutually reinforcing, however, I argue that they are analytically distinguishable and involve different dimensions of social antagonism and contradiction. The first conflict is that between

globalisation and democracy. It represents a certain contemporary reconfiguring of earlier class conflicts and it poses the problem of collective determination. The second conflict is that pertaining to relationship between social action and social institutions. It will be argued that the experiences of compelled but thwarted participation give rise to alienation. The third conflict is connected to the fracturing of the channels of integration in contemporary capitalist societies and the corresponding disassociation between the positions of wage labour and citizenship. This conflict manifests itself in forms of marginality and exclusion, as well as disorderly discontent and resistance to social disintegration.

## b01RN29 - Social Theory I.

### Difference and Memory in Habitus: Deconstructing Bourdieu

Mahmut Mutman, Istanbul Sehir University | [mahmutmutman@sehir.edu.tr](mailto:mahmutmutman@sehir.edu.tr)

Pierre Bourdieu's notion of "habitus" is often praised for its capacity to enable us to comprehend an active and embodied sense of past or memory. By concept of "habitus", Bourdieu offered powerful criticisms of structuralism and of phenomenological theories. I would like to argue that Bourdieu's refreshing approach is stamped by an old sociological assurance, in which the notion of past is a past present, and the concepts of learning and memory have a strongly Platonic resonance. His ethnography of the Islamic society of Kabyle turns into a vehicle of autobiographical anamnesis, in the guise of a criticism of homo economicus, which reveals the sociologist's re-assurance of his own universal position located in Europe. More

importantly, it is difficult to think novelty, change and difference within Bourdieu's framework. In spite of the sociologist's insistence on improvisation, the only difference that can be read is the one reproduced in the given operative schemes of habitus. By a close deconstructive reading of the concepts of memory, mimesis and gift in Bourdieu's well known studies on Algeria, I would like to argue that the concept of habitus is impossible to think without a deconstructive approach to the past as absolute past, and the gift as unconditional gift, that is to say, without its own deconstruction, which opens it to an otherness that it struggles to contain within its ethnographic protocols.

### Biology in the Age of Social Capital: From Social Neuroscience to Network Capitalism

Maurizio Meloni, University of Nottingham | [maurizio.meloni@nottingham.ac.uk](mailto:maurizio.meloni@nottingham.ac.uk)

In recent years, in the middle of an unprecedented financial crisis, a proliferation of books about empathy, cooperation, and prosocial behaviours (Brooks, 2011), and a new rhetoric for which "greed is out, empathy is in" (de Waal, 2009) have significantly influenced the language of biology (Meloni, in press). The emergence of the concept of the 'social brain' has been particularly influential in this shift. Largely replacing former notions of the brain as a solitary computer, the new brain of social neuroscience is one pervaded by connections, liaisons and networks, and increasingly impacted by social structures "from dyads, families, neighbourhoods (...) to cities, civilizations and international alliances" (Decety and Cacioppo, 2011). Loneliness and social isolation are seen as the capital sins of

this new social brain, designed by evolution with an "exquisite sensitivity" to social connectedness (Hawkey and Cacioppo, 2011) and the importance of relationships. Expanding on Malabou's (2008) investigation of the link between social functioning and neural functioning, in this paper I focus on the resonance (and frictions) between this new hyper-socialized account of the brain and notions of social capital and network capitalism. My interest is toward an understanding of the way in which the epistemology of contemporary biology, with its new vocabulary of plasticity and ultra-sociality, reflects and is affected by changes in social structures, as well as biological concepts are increasingly mobilized in the scientific literature to offer an answer to the current

social and economic crisis.

## Neoliberalism and its contradictions in bioeconomic perspective

Emiliano Bevilacqua, University of Salento | [emiliano.bevilacqua@unisalento.it](mailto:emiliano.bevilacqua@unisalento.it)

Neoliberalism and its contradictions in bioeconomic perspective The paper aims to show how the foundations of political economy rest on contradictory manifestations of life in the biopolitical regime: the needs of men, in fact, are the basis of an economic system which, while recognizing their importance, can't provide positive feedback to human aspirations. Some have argued, then, that just the neoliberal economic theory excellently exemplifies a process of activation and, at the same time, closing of life in contemporary forms of biopower: this mechanism would explain also the secret reason of permanent fascination that the neoliberal vision of the man exercises in our society, despite the current deep crisis of capitalist economies. The bioeconomy would be a privileged field for studying the ambivalence of the subjects and

their lives, providing an opportunity to reflect with greater analytical capacity on the liberation of the subjective aspirations, finally free from the shackles of power: if it is true that the economy is the center of the relationship between politics and life, the unresolved issues related to the outcome of the conflict between the immanence of life and the transcendence of biopower could usefully be assessed in bioeconomic terms. The paper will discuss the possibilities of emancipation of the subject in the light of the contradictions of neo-liberal economic theory, emphasizing the sociological and philosophical contributions starting from Michel Foucault's reflection on German ordoliberalism and U. S. monetarism [Naissance de la biopolitique, Cours au Collège de France 1978-1979]

## Footsteps of Cyber-Society

Mesut Hazir, Dumlupinar University | [cosmicus26@hotmail.com](mailto:cosmicus26@hotmail.com)

World is changing faster than ever and social analysis of that rapid change is more difficult than ever. Using Peter Drucker's terms, it can be said that we are living in a "post-capitalist society". With Daniel Bell's words, it is a post-industrial society. When Comte, Marx and especially Saint-Simon defined their society as "industrial society", they had already been living in an industrial age for a while then. To make generalizations about an era and to define the society as a new type of society, we need about 30 to 50 years of observation. In this study, we will attempt to define a new

society apart from industrial, post-industrial, post-capitalist or even Manuel Castells' "network-society". Cyber society is very similar to Castells' network society, but with some important differences. Big social transformations always affect all social institutions within time. Family, education, economy and all others are affected very dramatically within big social changes. Main target of this study is to define today's society as "cyber society" and to trace the footprints of this society in social institutions like family, education and economy.

## Two Possible Ways of the Sociology Development as Two Versions of the Social Dimension

Svetlana Alekseevna Sharonova, St-Tikhon's Orthodox University | [s\\_sharonova@hotmail.com](mailto:s_sharonova@hotmail.com)

Born in Europe sociology immediately received a response in the minds of Russian philosophers, theologians, philosophical position which was significantly different from Western scholars. One of the main differences was the issue that means social reality. In the definition of the term E. Durkheim and M. Weber were based on the analysis and understanding of the religions and their place in society. Separate religion from culture, they got two dimensional space dimension of society. The chief justices of social change are the people themselves, which adjust their actions according to their own views and opinions. According to Russian philosophers, theologians (Solovev, Florenskiy, Berdyaev, Fedorov, Bulgakov), religion cannot be separated from the culture, the culture is only sheets on the tree of the religion. Social reality

in their understanding becomes three-dimensional space, where the practice, human morality is always related to the divine commandments, laws. But the Russian sociology has been destroyed and forgotten, and world sociology began to develop along the path indicated by European sociologists. Intensification of religious extremism brings us back to the starting point. Perhaps confessional sociology will deepen their understanding of the problems within the religious community, which is not confined to any state, and should not necessarily be formally adopted standards. The purpose of this paper is an attempt to describe the perception of social reality, using the principles of Russian philosophers, theologians, and uncover opportunities measurement mechanisms that society.

## a02RN29 - Critical Theory II.

### Critical Theory Construction of the International Network of Public Sociology Centers

Marta Soler-Gallart, University of Barcelona | [marta.soler@ub.edu](mailto:marta.soler@ub.edu)

Adriana Aubert, University of Barcelona | [adriana.aubert@ub.edu](mailto:adriana.aubert@ub.edu)

There are diverse ways of doing public sociology in different historical contexts and political regimes, but some important dilemmas faced by sociologists are common. One of them is the relation between academic and extra-academic fields when social scientists engage with civil society and the public sphere. Current societies are facing the increase of inequalities, the diversification of social problems and the difficulties to overcome such problems through social

theory. The public sociology led by Michael Burawoy creates sociological knowledge that has an interest for society. Arguing that it is possible to overcome the tensions and provide unity among the different types of theoretical knowledge, we will share the work that different sociologists are doing on an international level in order to consolidate a network of public sociology centers worldwide. Scientific quality in social theory depends, more and more, on the capacity to connect

theoretical debates with the needs of citizenship. We will discuss the different ways to do public sociology, showing theoretical discussions regarding the complexity of intervention and the construction process of sociological knowledge through dialogue with social agents. We will bring examples of this process and evidences of its theoretical and social impact, from different national contexts

and within an international dialogue. Under a Weberian Ethics of Responsibility, the public sociology centers contribute to social theory, giving answers to overcome inequalities and exclusion worldwide, but also to strengthen democracy. The critical theory applied to public sociology will provide frameworks of knowledge that favour the development of this international network.

## **Towards a critical theory of Central European Societies**

**Domonkos Sik**, Eötvös Loránd University, Budapest | [sikdom@gmail.com](mailto:sikdom@gmail.com)

Critical theories are reflections on modernity from the perspective of an implicit or explicit normative basis. As they evaluate the existing social constellation, they are linked not only to the empirical realm of sociology, but also to the transcendental realm of philosophy. Accordingly critical theories are always embedded in a specific social and historical constellation in at least two ways: they are reactions to local experiences of social suffering and they are oriented by the values of a cultural setting. In this sense critical theories are inevitably limited in their explanatory power, as they have substantive and normative blind spots. Some critical theories try to overcome this limitedness by choosing universal values for normative basis (e.g. Bourdieu, Giddens or Habermas). However the substantive limitedness characterizes these

theories as well. That is why regions having unique historical experiences, such as the "semi-peripheral" countries of Central Europe, require their own critical theory. In order to elaborate a critical theory of Central European societies, first the specific challenges of their modernization have to be identified. This task implies a difficulty as identifying the specific challenges is a quasi-critical theoretical analysis itself. In order to evade this paradox the phenomenological analysis of Central European social thought of the interwar, state socialist and post-transition era is called upon, with the intention of revealing the local "primordial impressions" (Husserl) of modernity. The combination of universal and local experiences of modernity enables the outlining of those specific problems, which require autonomous critical reflection

## **Inside fake reality: potentials of Kulturindustrie in view of the current crisis**

**Martin Steinlechner**, University of Innsbruck | [martin.steinlechner@student.uibk.ac.at](mailto:martin.steinlechner@student.uibk.ac.at)

In his Adorno-lectures in June 2012 Wolfgang Streeck draws the perspective of a 'postponed crisis of democratic capitalism'. He therefore argues, the current crisis would be the outcome of a longterm transformation: initiating in the 1970s as the period of critical analysis of late capitalism, but focusing on inflation, national debt and private deficit spending as major tools to maintain post war growth policy up to today's crisis. Our paper

intends to pick up the potential of Streeck's perspective on a different level: therefore we suggest, that only the frame of Kulturindustrie and its character of naturalness can sufficiently reason and ensure the force, which technologies of authority – as indicated by Streeck – just as the subtle technologies of the self (Rose, Bröckling) are able to unfold within the totality of governmental techniques (Foucault). Such meaning of Kulturindustrie

not only intends to point out its ability of securing loyalty and power in the sector of governance but even more its perfection in tranquilising potentials of resistance. From this point of view 'advertising the world as it is' (Adorno) seems indispensable for perpetuating growth policy after its virtual end and only Kulturindustrie as formation of late-capitalist society as such allows the tools of inflation, national debt and private deficit

spending to develop their pacifistic force, as indicated by Streeck. Based on Adorno's and Horkheimer's assumption of Kulturindustrie, the paper therefore aims to outline a conceptional approach, which focuses on the impacts of such framing on the set of technologies in post-war governmentality, up to their destabilizing in the current moment of crisis.

## Critical Theory, Historical Sociology and Russia's Post-Soviet Political Transformation

Mikhail Maslovskiy, Sociological Institute of Russian Academy of Sciences | [maslovski@mail.ru](mailto:maslovski@mail.ru)

Civilizational analysis in historical sociology reveals the role of cultural factors in the peculiarities of political institutions. Johann Arnason's multiple modernities theory which focuses on both cultural and political aspects of civilizational dynamics is relevant for explaining political change in post-communist societies. Arnason has worked out a version of critical theory of modernity that regards culture as a constellation in which social creativity and contingent events can change the course of development. He considers three reference points connected with the study of the Soviet model of modernity: movements, empires and civilizations. Apparently the imperial and civilizational features of Soviet modernity are related to the problematic of post-communist political transformation in

Russia. The civilizational identity of the Soviet system was formed by Marxism-Leninism as a political religion. According to Arnason, this 'secular religion' did not penetrate society to the same extent as historical religions. Nevertheless, neo-traditionalist aspects of the Soviet model remained influential in Russia in the last two decades. The Soviet civilizational and imperial legacies played an important role in the reversal of Russian democratization. At the same time Arnason's version of critical theory that emphasizes the creativity of social action allows us to discuss the possibility of changing the existing trends. From this perspective the rise of new social movements may have a crucial impact on the future course of Russia's political modernization.

## b02RN29 - Social Theory II.

### The Crisis Debates and Re-interpreting the Sociological Classics

Ibrahim Yucedag, Mardin Artuklu University | [ibrahimyucedag@yahoo.com.tr](mailto:ibrahimyucedag@yahoo.com.tr)

The debate on the crisis of Western sociology had started with Alvin W. Gouldner's *The Coming Crisis of Western Sociology*. After

Gouldner declaimed the crisis, he drew attention to the solution. For this reason, not only alternative theories of functionalism, like

ethnomethodology, phenomenology etc., but also re-interpreting the sociological classic's have been debated by modern sociologists. These debates are related both how the crisis can be solved and what political impact on this debate. Because of the rising liberalism and Max Weber's ideas, on the one hand, and

collapsing of socialism and Karl Marx' ideas, on the other, 1970's sociology has faced crises in different sizes. In this study, we will discuss Weber's contribution and political influence to the crisis debates in terms of 1970's political and intellectual history.

## Sociological enlightenment: Weberian meditations in the Russian context

Denis G. Podvoyskiy , Peoples' Friendship University of Russia, Moscow | [dpodvoiski@yandex.ru](mailto:dpodvoiski@yandex.ru)

In recent years we can observe a significant intensification of the professional discussion on the role of sociology in the Russian society. Russian sociologists try to achieve public recognition, but still don't look quite successful in this regard. The sociological profession becomes more and more mass and popular, but the Russian society shows a limited demand for sociologists. This situation provokes attempts to understand what's going on resulting in some individual and collective strategies to overcome the unsatisfactory state of affairs identified. The representatives of the historical-theoretical branch of sociology have far more grounds for pessimism for there is no request for theoretical studies in Russia today. These scientists prefer such a 'self-legitimizing' strategy: 'we are needed only by ourselves, we do only what we are interested

in, we communicate only with a small circle of 'our own kind' and we are satisfied with the situation'. This position is either 'defeatist' or reflecting 'totally isolationist' and 'esoteric-sectarian' intention of these 'great adepts'. Such a strategy condemns any specific branch of science in any given society to oblivion and decline. I believe 'sociological enlightenment' gives us a chance to justify the meaningfulness of scientific studies on the theory and history of sociology (and one that is culturally significant far beyond the professional frames of sociology). The most important component of this 'enlightenment' is the demonstration of 'heuristic resources' of classical and modern theoretical sociology as a means of scientific explanation and such a conceptualization of social problems that would be comprehensible to non-academic audiences.

## The Mystery of the Social: Crisis, Critique and Change in Durkheim

Cagatay Topal, Middle East Technical University, Ankara | [catopal@metu.edu.tr](mailto:catopal@metu.edu.tr)

Based on the sociological premises of classical forerunners ("fetishism" of Marx, "meaning" of Weber, "thing" of Durkheim and "secret" of Simmel), I argue that the social is mysterious in four ways: First, any social fact is located within a spectrum between the perceptible and the imperceptible. The more perceptible, the closer; the more imperceptible, the more remote. Second, a social fact is a thing. It is, to a certain extent, reified, not immediately given and nameable. Third, a social fact is an

organization of the social excess. It exists through the association of surpluses. Finally, a social fact appears through encounters and is an attempt towards a truth. How to locate crisis-critique-change within the mystery of a social fact? Crisis is the rise of imperceptibility due to the increasing thingness of the social fact. Thus, crisis is in the first to the second traces of the mystery. Critique is the attempt to name the thing and a gradual opening of the social fact. Thus, critique is in the second to

the third traces. Change is the reorganization of the excess and the reestablishment of perceptibility. It is a new truth. Thus, change is in the third to the fourth traces. Karl Marx may be the best figure to observe crisis, critique and change all the way through his search for

truth of the thing within the surpluses of the spectrum. But, this paper prefers rather neglected name, in terms of this triple revealing process of the mysterious social, crisis-critique-change: Emile Durkheim.

## **The Sharing Crisis in the Society of Difference. The Application of the Simmel Theory**

**Donatella Pacelli**, Lumsa University of Rome | [pacelli@lumsa.it](mailto:pacelli@lumsa.it)

Simmel has a special place among the classics as a sensitive observer of almost unexplored aspects of modern life, but especially as a first theorist of the limit. In an age that has lost its sense of limit as a self-restraint and promoted heterodirection and supervision, the Simmel thought becomes highly relevant. It leads to the recognition of the limits issue that everyone must meet to live in reciprocity or to not to cross the line of sociability. Simmel argues that the need to not to lose the sense of the limit in order to not getting into the culture of the unlimited, that overbears others, because it does not allows to see new dimensions for human society and creates new forms of disparity and social exclusion. The contribution of Simmel appears to be next to

the characteristics of contemporary authors, for the attention to the tightening affecting humans in the definition of spatial limits, and in the seek for halfway zones as areas to experience the differences of the global world. The identified interpretations open questions about different areas of collective life. These questions highlight the difficulties in setting an objective and subjective limit, related to the high number of other human beings met. These considerations are part of a theoretical construct able to identify what may modify or broaden the space for meeting and going beyond the structural limits, in order to be voice for the request to be included and recognised typical of sociability and social relationships.

## **a03RN29 - Critical Theory III.**

### **„A picture holds us captive“: Ideology, Identity and the Process of Recognition**

**Sebastian Bandelin**, Philipps University, Marburg | [Bandelin@students.uni-marburg.de](mailto:Bandelin@students.uni-marburg.de)

The theory of recognition is an important approach for the development and normative foundation of a critical social theory. One central thesis is here that the formation of a positive personal identity depends on the affirmation by others in contexts of mutual recognition and that this affirmation is the decisive normative criteria for the constitution of social institutions. But insofar as this

personal identity is in many cases only conceived as an identification of the actor with his own qualities and abilities, it follows that the social context, in which this positive personal identity is achieved, remains arbitrary. The trouble is here that the affirmation of a certain personal identity may than correspond to the existing expectations of the actor and ensure his integrity, but at the

same also reaffirm the power relations of the social context, in which this identity was formed. In the second part of my paper i would like to develop an account oriented towards the social philosophy of pragmatism, which avoids these problems. Recognizing has to be conceived not as a affirmation of an already existing identity, but as a social process. In this process the actors and social groups are always confronted with unintended social

consequences of their actions for others and are therefore led to a crisis and reformulation of their actual practical identity. Mutual critique is in this view the condition to elucidate the action-guiding dispositions and beliefs and to come to a better self-understanding. In consequence critique refers to blockades of this process of experience, in which existing practical identities and institutionalized rules are questioned and reformulated.

## **Denying of Social Recognition – from Theory of Recognition towards Sociology of Disrespect**

Benno Herzog, University of Valencia | [benno.herzog@uv.es](mailto:benno.herzog@uv.es)

The work of Axel Honneth, director of the Institute for Social Research in Frankfurt is known throughout the world as Recognition Theory. The starting point of his analysis of the normative potential of social reality, i.e. the point from where the existing society can be criticised and pushed towards a process of emancipation, is closely linked to affective reactions of misrecognition. With this approach Honneth aims to overcome what he calls the "sociological deficit" of the Theory of Communicative Action of his former master Jürgen Habermas. Nevertheless even in this "Theory of Misrecognition" - which would be the better name for Honneth's approach - there is still a sociological deficit; there are still conceptual problems when it comes to observing and analysing affective reactions of misrecognition and to convert them into

positive demands for social recognition. The aim of the presentation is to show that Foucault's approach on discourses, sociology holds a promising toolbox for asking for the non-verbal conditions and rules of the emergence of specific discourses. In our presentation we will therefore outline the theoretical and empirical possibilities stemming from overcoming the sociological deficit of the Theory of Misrecognition. We call this approach the Sociology of Disrespect. We will see how the Sociology of Disrespect can help to distinguish different moments in the denying of recognition, related to different social spheres. We present some of these mechanisms of "discursive exclusions" who start taking place already before entering the process of verbalization of misrecognition.

## **An Outlook on Sociology as a "Mode" of Critical Theory: Autonomy and Interdisciplinarity**

Stefan Klein, University of Brasilia | [sfkstefk@yahoo.com](mailto:sfkstefk@yahoo.com)

The hereby proposed presentation aims to address the issue of how sociology and philosophy relate and distinguish themselves in the late perspective of a critical theory of society as conceived in the intellectual work of Theodor W. Adorno. In this sense, I shall focus

on posthumous published transcriptions of two teaching courses ("Vorlesungen"), specifically those on "Negative Dialectics" (1965/1966) and on "Introduction to Sociology" (1967/1968), this one the last full course taught by Adorno. If because of their epistemological roots this

evidently includes directing oneself to the epistemic status of dialectics and critique in this outline of social theory it furthermore allows us to consider problems of disciplinary frontiers and the questions surrounding scientific autonomy (even if we separate intermediate approaches like the "humanities"). What should stand out during this discussion is to what extent the intertwinement of philosophical presuppositions are a central matter for sociological knowledge or if, otherwise, there is a clearer proposal in terms of the theoretical framework attributed to each one of these

disciplines. Foremost the contributions and the sometimes extended and on other occasions punctual dialogue Adorno maintains with diverse sociological perspectives in his lectures allow us to further understand his standpoint in regard to properties that classical and (at the time) contemporary authors from a sociological tradition would be able to provide. Under these circumstances the prospect of reflecting upon definition(s) of sociology nowadays could benefit from those conceptions and interpretations (Deutung) brought forward by him.

## Theorising Moralisation and Class

Elias le Grand, Stockholm University | [elias.legrand@sociology.su.se](mailto:elias.legrand@sociology.su.se)

The last decade has seen a revitalization of research on the cultural dimensions of class. This has also involved an increased interest in the relationship between class and morality, such as the role of moral boundaries in the formation of classed distinctions and identifications. This paper seeks to further develop on this agenda by linking culturalist research on the moral dimensions of class with work in the field of moralisation. The latter encompasses studies of moralisation processes, in particular those of moral panics and moral regulation. Such processes entail the articulation and circulation of moralising discourses which act upon the conduct of self and other. Yet, despite shared foci on issues of moral boundaries, identity and power there has been no sustained dialogue between culturalist

class scholars and students of moralisation. This paper argues that such dialogue is long overdue and would mutually benefit both strands of research. The paper shows how the articulation of moral panic and moral regulation discourses can be framed within wider processes of class formation, and particularly the construction of classed distinctions and identities. This means that class formation is bound up with processes of moralisation whereby some classed positions are constructed as lacking in value while others are conceived as valuable. The relationship between moralisation and the cultural dimensions of class is discussed in the context of the moralising rhetoric and policies of the British New Labour government.

### The Cold War, the FBI and the Sociology of Academic Consensus: Rereading Gouldner on Parsons

Maxim Kupovykh, University of Amsterdam | [M.Kupovykh@auc.nl](mailto:M.Kupovykh@auc.nl)

This paper updates Alvin Gouldner's celebrated analysis of the social infrastructure of the Parsonian paradigm in American sociology. Gouldner's argument was that the "domain assumptions" behind the Parsonian consensus in American sociology of the 1940s-60s resonated strongly with the social agendas and political ideologies of the New Deal welfare state officials and the "Cold War liberal" elites. I develop this argument based on the close reading of the Parsons FBI files and other previously classified materials. Specifically, I demonstrate that Parsons' and his colleagues' reaction to McCarthyism and the evidence of FBI surveillance— their displeasure with these phenomena and their efforts to cleanse

themselves of any suspicion of disloyalty— has made a major imprint on the intellectual questions posed and the answers offered by American functionalists. As far as theory and methodology of this study is concerned, my paper criticizes Gouldner's emphasis on macro-processes ("industrialization," "welfare state," etc.) in explaining the significance of an intellectual paradigm. Building on science studies, Bourdieu's analysis of intellectual fields and Randall Collins' hierarchy of "embedded levels" in explaining ideas, this paper focuses on institutions and networks at the "interfield nexus" between political and academic fields.

### Can Karl Polanyi's Theory Helps us to Understand te Current Crisis?

Bru BLE Laín, University of Barcelona | [bgrafic@gmail.com](mailto:bgrafic@gmail.com)

How we can understand the current crisis? Which theories or authors can contribute in a better way to understand it? This paper offers a new perspective on Karl Polanyi's work focusing on his 'Double Movement' theory. At the same time, his intellectual and empirical work shows strong ties with different theoretical perspectives -from marxism, left liberalism, and democratic republicanism- and it can be seen as a fruitful tool in order to understand, not only the Great Transformation era, but also the current crisis. Hence, the paper shows two main ideas. Firstly, this paper seeks to demonstrate how the process of "embeddedness and disembeddedness" of the economic activity from/to social order (in Polanyi's words) can be use as an important intellectual tool to understand the current financial and social processes and their

changes. In deep: how societies are responding in front of the new economic scenario? How populations are affected by the main financial reforms all around the EU? And, how the 'double moviment' are materializing in the current political and economic context? Secondly, this paper tries to identify the relation between the Polanyi's work and democratic Republicanism tradition. During the recent years there have been an important revival of Republicanism, although too often from a little 'romantic' or 'rethoric' point of view. The Karl Polanyi's work can be use both from a theoretical perspective, and an empirical one, as an substantial contribution to this tradition of though. His work links the ancient theories with the recent economic shifts (like financierization of the economies, and privatization processes). As a conclusion,

this paper argues in favor to the importance to use histori

## The Unknown Parsons and his Contributions to current Sociological Theory

Esther Oliver, University of Barcelona | [estheroliver@ub.edu](mailto:estheroliver@ub.edu)

Lidia Puigvert, University of Barcelona | [lidia.puigvert@ub.edu](mailto:lidia.puigvert@ub.edu)

The European Union faces great challenges that are hindering its consolidation and enlargement: extreme right vote and racism are growing. The comparison that Parsons establishes between Europe and North America shows the relevant role of what he defined as integrating system. His concept of societal community is of great utility to understand the difficulties of consolidating United States in Europe. Since the 16th century, people and groups with very different origins constructed North America as shared territories. In order for the norms that had to lead their lives to incorporate different particular identities, they were forced to search for a level of abstraction that was superior to these identities. Therefore, Parsons considered that in North America societal community was more developed than in

Europe; which could explain the current difficulties for the consolidation of a European citizenship and constitution that overcome national borders. The differences between the processes of construction of norms in Europe and in the United States, have an impact on the loyalty of the individuals towards them. The most recent contributions of Parsons allow to progress in the sociological theory by connecting them with Habermas' concept of the lifeworld, incorporating the idea of agency and the capacity of social transformation of the subjects within the concept of societal community. This analysis allows us to tackle a theoretical debate of a great relevance today: the inclusion of all voices in the construction of social norms which have to allow us to reach social cohesion in multicultural Europe

## Rockefeller Foundation and Institutionalization of Sociology in Interwar Czechoslovakia

Marek Skovajsa, Charles University Prague | [marek.skovajsa@soc.cas.cz](mailto:marek.skovajsa@soc.cas.cz)

This paper intends to make a contribution to the sociology of the international circulation of ideas by studying the paths and modalities of the influence which external private donors exerted on the development of the field of sociology in Czechoslovakia. Taking its inspiration in the work of, among others, Christian Fleck, Ludovic Tournès, and Giuliana Gemelli, who mostly focus on the developments in France, Italy and the German speaking countries, this paper traces the impact that the funding programs of the Rockefeller foundation had on the institutionalization of sociology and the recognition of its relevance within the

academia and vis-à-vis the state in interwar Czechoslovakia. Emphasis is laid on the lessons that can be drawn from this case for, using the term coined by Pierre Bourdieu, a science of international relations in matters of culture. The paper identifies interesting instances of impact, or of the failure to have an impact, and asks in what ways the foundation funding helped to set the agenda of this emerging field. It shows that the transmission of ideas taking place under the sponsorship of the Rockefeller Foundation was full of mutual misunderstandings and strategic manipulation related to the differences in the intellectual climate and the structure of the academic

fields in the donor and the recipient country. The case study also reveals the significance of the mediated influence of the Rockefeller

funding on Czechoslovak sociology, in particular through France and the German speaking countries.

## a04RN29 - Critical Theory and Universalism

### Community/Society: The Natural Law Foundations of a Key Sociological Distinction

Daniel Chernilo, Loughborough University | [D.Chernilo@lboro.ac.uk](mailto:D.Chernilo@lboro.ac.uk)

Ever since the publication of Ferdinand Tönnies' seminal *Gemeinschaft und Gesellschaft* in 1887, typological constructions of this dichotomic kind have become a trademark of sociological thinking. Emile Durkheim's mechanic and organic solidarity, Talcott Parsons' tradition and modernity or Jürgen Habermas' system and lifeworld, to name only some very well-known cases, are all distinctions that can be interpreted as tributaries to this way of conceptualising social life. All their differences notwithstanding, these distinctions seek to deal with the tensions between description and normativity, on the one hand, and between analytic and historical justifications when conceptualising

social life, on the other. This paper traces back the philosophical origins of this distinction by looking at the natural law theories of Hobbes and Rousseau. It argues that Tönnies' Community/Society is in fact an attempt to make sociologically viable their arguments of the transition from the state of nature to the civil condition. It expresses the real difficulties that are involved in thinking the social as an emergent and autonomous ontological space that however still depends on (mostly implicit) conceptions of the human and human nature. More generally, I suggest that this is an instance of social theory's wider and deeper debts to modern natural law that still need to be explored more systematically.

### Natural Law and Critical Theory: Bringing Rights back in

Robert D Fine, University of Warwick | [robert.fine@warwick.ac.uk](mailto:robert.fine@warwick.ac.uk)

This paper re-assesses the significance of the idea of 'right' in the tradition of critical theory. Focusing on the work of Hannah Arendt and Theodor Adorno, especially in their confrontation with totalitarianism, it addresses their conceptualisation of rights, engagement with the philosophies of right of Kant and Hegel, and the ambivalent place of Marx in their thinking about rights. I argue that critical theory turned to natural rights in response to the perceived difficulties positive sociology had in confronting the barbarities of fascism and Stalinism, and steered a path between

philosophies of right that acknowledged the idea of right within an unacceptably naturalistic frame of reference, and a sociological consciousness that denatured the idea of right at the cost of its devaluation. Arendt and Adorno both drew on the critical substance of natural right theory to distinguish between the critique of rights, which has as its end their revaluation, and the trashing of rights, which serves to reinforce their devaluation. I maintain that there is much to be gained for our understanding both of rights and of critique from critical theory's engagement with the

natural law tradition.

## b04RN29 - Social Theory IV.

### Social Context: What is it and how does it work?

Keming Yang, University of Durham | [keming.yang@durham.ac.uk](mailto:keming.yang@durham.ac.uk)

Few sociologists would deny the importance of social context but few have explicitly defined what social context is, let alone constructing an analytical framework for guiding empirical studies on the effect of social context. Sociologists do not seem to be bothered to clearly define what social context exactly is and the specific ways in which it works. Like social capital, social context has become an extremely popular concept but it is used for a long time without much analytical clarity and explaining power. In this paper I aim to take the first step toward clarifying the meaning of

the concept and putting some organization into its study by discussing some examples in which the term is used, including studies employing both qualitative as well as quantitative methods. The key argument of this paper is that while sociologists should try to make their work accessible to the general public, in order to avoid unnecessary confusions and to increase the power of their theories, they should make every effort to sharpen the precision of the meaning of the key concepts in their discourse.

### Evidence and interest in social theory. An ontological-practical approach.

Risto Heiskala, Tampereen yliopisto | [risto.heiskala@uta.fi](mailto:risto.heiskala@uta.fi)

What is social theory? The paper opens with presenting the way to understand social theory as an ontological approach that explicates the nature of the worldview we should adopt providing that the results of the most advanced empirical social science are true. After loosening the limitations of such realist conception by introducing normative standards and dialogue with other provinces of meaning than science it asks, how can we chose between alternative conceptions in social theory? It turns out that the element of voluntaristic choice cannot be avoided completely but that there still are many ways

to limit the number of conceptions that can be taken seriously. After that it discusses the nature of evidence used in such choices (showing that the differences between social theory and empirical social research have been greatly exaggerated), the level of generality and contestability of theoretical statements and the interests to knowledge involved. In the final part of the paper the ontologically oriented approach is put into dialogue with an understanding of social theory as a form of practical reason in the service of our ideas about better society, and a synthetic view is developed.

## (In)determinacy. A Theoretical Figure for Analyzing Change Processes.

Victoria von Groddeck, Ludwig-Maximilians-University, Munich | [victoria.v.groddeck@soziologie.uni-muenchen.de](mailto:victoria.v.groddeck@soziologie.uni-muenchen.de)

Julian Müller, Ludwig-Maximilians-University, Munich | [julian.mueller@soziologie.uni-muenchen.de](mailto:julian.mueller@soziologie.uni-muenchen.de)

When this paper introduces the theoretical figure of (in)determinacy it ties itself, on the one hand, up to theoretical contributions that describe society as becoming more and more indeterminate, complex, and transiting. On the other hand the focus is rather different. Not the loss of determinacy, certainty, and unambiguousness is of interest, but an empirical observation: the highly visible success of indeterminate forms of communication in modern society, i.e. forms of social practice that stabilize themselves by indeterminacy or at least by oscillating between determinacy and indeterminacy. We begin with this observation to develop the theoretical figure of (in)determinacy, which can

be used to analyze contemporary social phenomena by overcoming ontological dichotomies like structure and process, as well as stability and change. The strength of this figure is that it directs the view to aspects of social practice where indeterminacy is not the problem which has to be criticized but rather the solution, as structures emerge in practice by emphasizing indeterminacy. It is thereby a theoretical figure which stands in the tradition of operative thinking, poststructuralism, and practice theory and explains how in a fluid, permanently changing world a certain stance of stability – of course only temporarily – is gained by indeterminacy to secure complex social structures.

## a05RN29 - Social Theory, Categories and Narratives

### Solidarity: Theoretical Foundation of an Analytical Category

Ulf Tranow, Heinrich-Heine University, Düsseldorf | [tranow@phil.uni-duesseldorf.de](mailto:tranow@phil.uni-duesseldorf.de)

Solidarity is a key issue in sociology. There seems to be no analysis of societal change and no diagnosis of a societal crisis which does not refer to solidarity. Despite this prominent position of solidarity in sociological literature there has been surprisingly little attention to the question what constitutes solidarity from a genuine sociological perspective. I will suggest a sociological concept of solidarity which works as a general framework for theoretical and empirical investigations (Tranow 2012). The concept synthesizes and amplifies ideas of Durkheim (1992), Hechter (1989) and Lindenberg (1998). The central idea is that norms make up the core of solidarity.

Solidarity norms ask their addressees to transform resources without compensation to a collective end or to another person. I differentiate between four universal solidarity norms which can be found in associations on every level of social aggregation: norms of provision, of sharing, of supporting and of loyalty. Based on this, I argue that there are two levels of solidarity to be distinguished: 1) solidarity as a specific type of action on the level of individuals and 2) solidarity as an attribute of social systems. As a type of action solidarity defines itself as a following of solidarity norms which is intrinsically motivated. On the level of a social system

solidarity is manifested in the legitimate solidarity norms that exist in this social system. Based on this theoretical conceptualization of solidarity I will outline an agenda for the sociological analysis of

solidarity issues. In particular I will show that this concept is applicable to very different social contexts, from informal relationships to organizations and states.

## Lives in Fiction: Auto/Biographies as Theoretical Narratives

Dennis S Erasga, De La Salle University | [dennis.erasga@dlsu.edu.ph](mailto:dennis.erasga@dlsu.edu.ph)

Sociological imagination is an open invitation to theorize from the stories we tell about ourselves and others. More than self-expression, the sociological ethos of auto/biographical narration is to extend the reality of a solipsistic and exclusive existence into a common and public experience. In order to achieve this, the narrator must convert biographies into scribed realities. The narrating process, however, has unique epistemic anchorage (memory-based) and stylistic requirement (literary) that encages

lived lives into fictional genre giving this mode of writing a unique interpretive lens that projects new visions of the social. Consequently for theorizing purposes, auto/biographies are meaning-claims that should no longer be read exclusively in terms of their dramatic and documentary values, but more in terms of their theoretical affordances. The paper explores the implications and utility of fictionalized auto/biographical narratives in expanding the ambit of sociological theorizing.

## Toward an Interactionist Sociology of Ethnic Relations

Janusz Mucha, AGH University of Science and Technology | [jmucha@post.pl](mailto:jmuch@post.pl)

This text has three parts. In the first, I discuss the presence and absence of the concept of “social relations” in social sciences and focus on “ethnic relations”. Then, I analyse the ways in which the theoretical problems of ethnic relations are conceptualized in sociology. Finally, I offer my own suggestions. Why is it worth dealing with concepts of interactions and social relations at all, especially with respect to macrosocial phenomena (such as “ethnic issues”)? First, it seems to me that these are some of sociology’s most basic concepts. Second, the relational and interactionist current in contemporary sociology offers some

important inspirations relating to the analysis of macrocultural phenomena. I suggest to follow Randall Collins’ ideas and seek the “microfoundations” of macrosocial phenomena in the chains of interaction rituals present at the foundation of society as such. I intend to avoid such a sociological approach to ethnicity which calls all ethnic phenomena “ethnic relations” but in fact deals mainly with individual groups, types of structured ethnic order or attitudes. Actually, ethnic order rests on the interactionist understanding of the social relations between ethnic actors. It is these relations which dynamize social order.

## 06JS18JS29 - Social Theory and Media Sociology Today 1

Co-Chair: George Pleios , University of Athens; Co-Chair: Csaba Szalo , Masaryk University;

### Communication of the Cultural Public Sphere

Maarja Lõhmus, University of Tartu | [maarja.lohmus@ut.ee](mailto:maarja.lohmus@ut.ee)

This work presents an overview of the communication theoretical foundations that allow for the cultural conceptualising of the public sphere as a global field. In 1964 McLuhan conceptualised media as the extension of one's senses, which allows man to experience the world more deeply and broadly (McLuhan1964). In modern times this offers the opportunity not only for personal cognition, but also for global presentation; the featuring of and communication between individuals and cultures have been opened up. Both individuals, on the micro level, and countries and cultures of the world, on the macro level, have received new perspectives during the development of the new information and media technologies: humankind can share information and original stored and living cultural achievements in the new, global mental space. Habermas has theorised the

public sphere, dividing it into political and cultural spheres (Habermas1962). The theories of the public sphere are focused more on the political public sphere. The goals of the political public sphere have been unification, standardisation and reaching a conclusion(s). It is more difficult both technologically and ideologically to accentuate the cultural public sphere, or model the common global cultural field as the values of UNESCO cultural heritage and as living cultures. The value of the global cultural public sphere is the diversity of ways of thinking and languages. I study the model, how theories of communication are guiding to the field of human cultures (Habermas1962, Habermas1975, Giddens1984, Anderson1991, Castells1998, Webster2004, as well as sociology- Bourdieu, post-structuralism- Foucault, semiotics- Barthes, Lotman; transcultural theories- Hepp, Livingstone, etc

### Cultural Studies in the Scene of Social Conflict and Social Solidarity

Tolga Hepdinciler, Bahcesehir University, Istanbul | [hepdinc@gmail.com](mailto:hepdinc@gmail.com)

Firstly, this paper will analyze how cultural studies and media studies theorize working class at the turn of the twenty-first century. Moreover, class relations and interactions will be discussed in relation to the Marxist orthodoxy. The structural relationship between the working class and mass culture, which is constructed upon property ownership, mechanisms of distribution and sustainability of the whole process will be elaborated. Especially Williams' and Hogart's writings on the roles of the working class immanent to culture, Thompson's central attribution to culture in the construction of the working class and Hall's writings on the relationship between

cultural identity and working class in the context of hegemony will be the basis of defining the role of working class in cultural studies. In the last three decades of the 20th century, most of the American cultural studies have been evolved around the identity axis and mass culture's role on the construction of the cultural identity. This brings about the necessity to discuss the transformation in the definition of the working class compared to the postmodern/ post-structural /post-colonial discussions. In this context, theorization of the working class has lost its academic importance against ethnicity, gender and race. Through the lines of the above-mentioned discussions, this

paper will define and analyze the validity of new tendencies in cultural and media studies within our specific research on the working-

class in the scene of social conflict and social solidarity in Turkey.

## Narratives of Crises on TV: Centennial and Annual Reviews from Four Cultures

Peter H. Ludes, Jacobs University, Bremen | [p.ludes@jacobs-university.de](mailto:p.ludes@jacobs-university.de)

Looking back on the 20th century of two world wars, genocide, nuclear bombs, colonial wars, and economic crises, major TV centennial reviews reveal specific crisis narratives. About five hours each of centennial reviews from Brazilian, Chinese, and US TV stations as well as about 25 hours of the public broadcasting review in Germany were analyzed. In addition, more than 95 hours of TV annual reviews from these four cultures, since 1999, were analyzed, reconstructing varieties, commonalities, and trends with concrete visual examples. High levels of violence are portrayed as especially newsworthy. The Brazilian centennial review, however, does not highlight wars or crises; the Chinese reviews emphasize the end of the century of humiliation from the mid-19th to the mid-20th century and the rise of a victorious

nation under Communist Party leadership; the German view back implies references to two world wars as well as pride in economic success since the fifties; the US centennial reviews celebrate a century of American global mission, grounded in democratic-moral-economic-cultural-military superiority. The TV yearend reviews since 1999 shift the balance from a history of great good vs. evil heads of state and soldiers to common people, financial markets, and international cooperation. These worldviews point to audio-visual grand narratives as indicators and partial forums for civilizing spurts (in the sense of Elias, 1939/2012, and Pinker 2011) and long-term frameworks for current crises diagnoses and journalistic, political or sociological (e.g., Beck 2012) judgments.

## Crisis and public spheres : Polis, nation, iterative democracy

Gilles Verpraet, University Paris Ouest Nanterre | [verp@ehess.fr](mailto:verp@ehess.fr)

Globalization processes and media connexions challenge the notion of public sphere as an arena for the exchanges of argumentation (Habermas, 1979, Habermas, 1994, Jacobs, 2012). These transformations questions not only the arena of debates, but also the political subjects who may address in the public sphere and the consistency of political culture (Eder, 2001) The question comes to examine the modes of recognition and the encounters inside the extended social networks, inside transnational social space. This methodology examine the dynamic of democratization as community of issues (Arendt), as politicization of common issues (Tassin, 2002, Beck, 2006). The polis indicates a moment of collective anxiousness, and claims. It designates also a

moment of collective deliberation and of construction of political alternatives We conclude to the constituency of three public spaces based on three encounters regimes (local, national, transnational). The analytical question comes on the modes of connexion between these three public spaces. This analytical development will be argued on the case studies such as the anti crisis mobilizations in Europe (Greece ,Iceland) and the Arabic mobilizations for democratisation between different public spaces. We discuss the concept of iterative democracy (Benhabib, 2006), formalizing the adjustment of alliances and the coalitions for the budgetary economic constraints, as a research process so to reconfigure the State and the political system

within the financial constraints

## Simmel's Theory of Fashion as a Hypothesis of Affective Capitalism

Juhana Venäläinen, University of Eastern Finland | [juhana.venalainen@uef.fi](mailto:juhana.venalainen@uef.fi)

During the recent years, it has been widely claimed (and argued over) that communicative and emotional skills have become a major constituent of organizing work in contemporary capitalism. The so-called 'affective labor' produces new subjectivities but also mobilizes more corporeal potentials for use of economic valorization. Thus, the key challenge of this new mode of production – referred to here as 'affective capitalism' – is not only about the capacity of the capital to commodify emotions but also and more importantly about the possibility of producing and reproducing a new 'affective human' (cf. *homo economicus*) and regulating his/her elemental volatility. This paper contributes to the research of social theoretical roots for new understandings of contemporary capitalism through a contextual rereading of Georg Simmel's writings on fashion. What Simmel develops here is

essentially an account of a new socioeconomic logic in which economic valorization is based on the passionate dialectic between imitation and variation. In the logic of fashion, the unsettled affects (such as restlessness, choppiness and contingency) do not hinder productivity but, on the contrary, seek to establish new platforms of accumulation. The second part of the paper discusses the political consequences of the vulnerable accumulation. Affective capitalism does not sigh for stability but flourishes in times and conditions of a continuous crisis. Thus, the organization of uncertainty is accompanied by double-edged changes in the structure of affects, as experienced by the economic agents, that provide a stock of 'seed capital' likewise for the politizations of happiness and for the normalizations of misery.

## a06RN29 - Cultural Sociology I.

### Rationality and rationalism in the European culture.

Massimiliano Ruzzeddu, UNICUSANO | [mruzzed@hotmail.com](mailto:mruzzed@hotmail.com)

Rationality is one of the bases of Western culture: in fact, one side, it has been a strong reference for social action, in all modern societies (both in Europe and worldwide); on the other side, rationality has deeply affected the European identities: most of the big narrations of modern Europe (market, ideologies, science, even religion) based upon a rational attitude. Although this rationalism had defined, often unconsciously, the European identities, nowadays, rationality seems to be facing a big crisis, just like the other narrations

mentioned are. In fact, it seems ineffective both in legitimating the continental, democratic and libertarian institutions (objective rationality), both in providing references for the economic activities (subjective rationality); furthermore rationality seems not to be any longer define social actors' identities, that prefer to rely on ascriptive, traditional boundaries. My paper will first focus on the actual limits of rationality: in fact, it is acknowledged that often, traditional, linear-dynamic-based rationality does not tackle the

complexity of reality. As a consequence, it will be necessary to highlight the domains of empirical reality, where rationality seems to work least and the reasons of this condition. Furthermore, I will try to show the most recent ideas of rationality, that fit to a complex world:

this will imply not only considering new concepts (systemics, fuzzy logics etc.) but mainly imaging a model of rationalism that is aware of its own limits, rejects the purpose of totally controlling reality and can orientate actors in a very fluid world .

## Positioning theory and the study of intellectuals

Patrick J.N. Baert, University of Cambridge | [pjnb100@cam.ac.uk](mailto:pjnb100@cam.ac.uk)

The sociology of intellectuals has made considerable progress in the last couple of decades through the work of a variety of scholars including Lamont, Collins, Camic and Gross. In this paper we assess the cogency and fruitfulness of the dominant research programmes in the sociology of intellectuals and present a case for a new theoretical alternative centred round positioning theory.

This new theoretical perspective represents a move away from a preoccupation with intentions, focusing instead on the effects of intellectual interventions for the symbolic recognition of the authors and for the diffusion of their ideas. We demonstrate the effectiveness of positioning theory by applying it to a number of cases, including the rise of public intellectuals like Sartre and Bourdieu.

## From Cultural Hermeneutics to Social Criticism

Csaba Szaló, Masaryk University, Brno | [szalo@fss.muni.cz](mailto:szalo@fss.muni.cz)

Both Habermas and Gadamer, critical theory and hermeneutics, share the theoretical presupposition of dialogic communication: the communicative form of linguistic understanding between two subjects. Language is an elementary form of social phenomena, which cannot be conceived without its formal direction to intersubjectivity. In Gadamer's words "Whoever speaks a language that no one else understands does not speak. To speak means to speak to someone." (Philosophical Hermeneutics,

p.65.) Nevertheless, there is a big difference between Habermas's and Gadamer's interpretive strategies that came into being from this shared presupposition. My paper deals with a project of critical social science as it was developed in the mid1970s around the journal Cultural Hermeneutics. The theoretical dilemmas articulated at that times in those innovative attempts to integrate critical theory and hermeneutics are still relevant for today's attempts to establish a cultural sociology.

## b06RN29 - Social Theory and Crisis

### On Catastrophilia. The Critical Potential of Crisis

Willem Schinkel, Erasmus University, Rotterdam | [schinkel@fsw.eur.nl](mailto:schinkel@fsw.eur.nl)

This paper explores the meaning and content of what can be called contemporary catastrophilia, a communicative preference for observations of crisis of the key social and natural systems of today. Based on a reading of Walter Benjamin, I argue that catastrophilia can involve the communicative transformation of catastrophe into 'crisis'. It then becomes a productive way of re-evaluating a global social life predominantly interconnected through crises: crises of migration, economic crises and ecological crises. The transformation of catastrophe to crisis forms a potent way to work out the tensions characteristic of a planetary social life. Specifically, through what can be called 'critical concepts', the social

tensions of globality are negotiated. The paper gives the example of 'climate' as a critical concept which allows the renegotiation of the relations between and configurations of the social and the natural. What is called the global climate crisis can from this perspective be seen as involving, on the one hand, a work of purification and of sorting out what is properly natural and what is social, while on the other hand 'climate' as a critical concept involves efforts at blurring or doing away with the very distinction between the natural and the social. Contemporary crisis consciousness thus provides sites of contestation through which modernity's self-understanding evolves.

### Understanding Inequality in Times of Corporate Power and Crisis

Daniel Houben, RWTH Aachen University | [dhouben@soziologie.rwth-aachen.de](mailto:dhouben@soziologie.rwth-aachen.de)

Critical understanding of social inequality not only needs to examine the roles played by organizations in producing, reproducing, and lessening social inequality, but also to attend to their relative positions and position-takings as important predictors of individual chances. Most approaches to social stratification and the empirical research they inspire neglect meso-level structures of relative organizational positions. Since organizations are the primary site of (re)production and allocation of social inequality neglecting them firstly leads to blindness to mechanisms that interfere with the predominant models of ascriptive, variable-centered analysis, secondly research loses track of politically induced meso-level processes which cause social inequality in modern societies, and thirdly they under-theorize the social world. Organizations form

institutional structures which themselves embody structures of inequality sui generis. Since individual outcomes largely depend on organizational structures and those structures depend on the social contexts of organizations, the necessary implication is to treat major individual outcomes as an ultimate function of the relational and relative position organizations find themselves in. Social inequality must be understood and analytically fashioned as a multilevel-phenomenon and be extended to the meso-level of organizations. As I will present, mapping and explaining the relative structure of the corporate world as a stratified space of positions and institutionally imposed mechanisms is crucial to inform and enable political interventions and to trace down key logics causing financial and economic crises.

## Theorizing through Metaphors: Marx and the Capitalist State

Haldun Güllalp, Yildiz Technical University | [hgulalp@gmail.com](mailto:hgulalp@gmail.com)

Marx is famous for the literary quality of his style and abundant use of metaphors. The Communist Manifesto opens with one ("A specter is haunting Europe") and closes with another ("The proletarians have nothing to lose but their chains"). While the metaphorical character of these and many other sentences in the Manifesto have never been questioned, one particular metaphor has been taken literally and generated a huge literature: "The executive of the modern State is but a committee for managing the common affairs of the whole bourgeoisie." Treating this obviously metaphorical depiction of the modern state in literal terms is an indication of a problem often encountered in the field of Social Theory. The field is usually perceived as primarily involving

the effort to learn what the great theorists have said, then decipher what they have really said, and then debate with others about the precise meaning of what has been said, and so on. This, I argue, is a form of intellectual laziness, despite the amount of work required for doing "hagiography" on the theorists and their theories. Following Richard Swedberg's recent intervention, I propose in this paper that we ought to orient our efforts, in both research and teaching, toward the active process of theorizing rather than theories, which are frozen on paper and often in time. I illustrate this point by comparing Marx's actual theorizing of the state with the literature debating his metaphorical statement.

## Refugees from the planet of freedom. Bauman's theory on people's unwillingness to face the crisis

Christos N. Tsironis, Aristotle University of Thessaloniki | [tsironis@theo.auth.gr](mailto:tsironis@theo.auth.gr)

Since the burst up of the economic crisis the European policies failed to resolve the recession and accordingly the severe social problems that came up together with austerity and financial uncertainty. This is a fact that rearranges the understanding of the current situation. Under these circumstances one could expect that facing the full scope of the crisis would bring into the fore new sets of ideas and possibly would encourage a variety of initiatives at personal and social level. Regrettably, today more than ever the political scene in Europe seems to be "frozen". Moreover, since the economic key-players are competing against each other to politically determine the European course of action it comes as surprise the fact that Europeans were not yet able to visualize a new agenda for Europe, whereas civic unrest has not been concluded to a transformative dynamic seeking

solidarity, welfare and social security within the new frame. This paper offers a contribution to current social theory debates about the ways economic crisis is affecting the social and political realm by presenting facets of the theory of Z. Bauman regarding citizenship and consumerism in Liquid Times. These concepts -belonging to his core ideas- create paths of critical thinking and increase the chances to better understand the reasons why people living in Consumer Societies gradually lose their bonds with totality as well as their unwillingness to participate in shaping the social world. The transformation of citizens into numb consumers will be presented as an anti-paradigm to his understanding of "citizen" as a social being that critically enquires the social conditions and is always eager to ameliorate the political participation and democracy

## a07RN29 - Cultural Sociology II.

### Justifications of Citizens' Subject Positions in the Politics of Welfare

Janne Autto, University of Lapland | [janne.autto@ulapland.fi](mailto:janne.autto@ulapland.fi)

Jukka Torronen, Centre for Social Research on Alcohol and Drugs, Stockholm University | [jut@sorad.su.se](mailto:jut@sorad.su.se)

Foucault's work has inspired studies examining how, through the construction of subject positions, citizens of the welfare state are encouraged to be active and responsible or to adopt the identity of consumer. Yet, these studies are often criticized for analyzing the subject positions as coherent constructions without considering how their construction varies from one situation to another. This paper examines the concept of subject position by bringing together three theoretical traditions. Firstly, it analyses Foucault's concept of subject position, which emphasizes the power of structures. Secondly, it addresses the shortcomings of the Foucauldian structuralist understanding of subject position by applying Boltanski's and Thévenot's pragmatic theory of justification, which gives greater value to actors' competence in social situations. Thirdly, the paper draws on the

concept of modality developed in semiotic sociology to expand this theoretical approach into a methodological tool, which is then applied to debates on children's day care in Finland. We argue that bringing together these three theoretical traditions helps to clarify how subject positions are justified in relation to different kinds of worlds (like citizenship, market, industry, inspiration), as well as made persuasive by connecting them to commonly desirable rights, responsibilities, competences or abilities. The theoretical approach elaborated in the paper gives a richer picture of the normative bases of the modern welfare state than, for example, the approaches that study the construction of subjectivities from the viewpoint of hegemonic discourses or that describe the justifications of welfare state in terms of economics, social equality or democracy.

### Bodily Communities: Theoretical Perspectives in Cultural Sociology of the Body

Maria Polikashina, National Research University Higher School of Economics, Moscow | [mpolikashina@gmail.com](mailto:mpolikashina@gmail.com)

This report is aimed at examining the relationships between social body, physical body and community. The body as separate topic was absent in classical sociological theories but now it is one of popular questions in theory and everyday life. Now the body has not palpable status over different communities and practices in modern society. The physical body is seen through social body which is formed by community. Community is organized with type of activity, rules, cultural symbols etc. The root and boundaries of community is also one of the questions in this report. So the

body is regulated by community in different ways, for example, body marks such as scars and tattoos demonstrate particular membership. Tattoos and scars on body are cultural symbols that is relevant and interpretative for members of community. Thus the community ascertains the rules for interpretation and aesthetic judgment of body marks and develops members' cultural imagination. Body marks specified for primitive and local community are extended in modern society with practices of consumerism, fashion of bodily aesthetics and representation of

lifestyles. Therefore the problem of bodily identity and bodily culture is becoming important now. The case of these modern bodily modifications will illustrate the

conceptual and theoretical problems of description and explanation of bodily order and provide with new theoretical questions in cultural sociology.

## Universality of Civic Cultural Code. Case of Czech Post-communist Transition

Veronika Frantová, Charles University, Prague | [v.frantova@centrum.cz](mailto:v.frantova@centrum.cz)

An extensive debate takes place about the concept of "relative autonomy" of culture in the Cultural sociology of J. C. Alexander. Alexander has been criticized for presenting too culturally idealistic approach (McLennan 2005; Gartman 2007), of not being consistent about the relationship of binary cultural structure to the narratives, myths or ideologies (Skovajsa 2012), of proposing oversimplified universal binary cultural structure without dealing with the action-structure problem (Battani, Hall, Powers 1997; Eliasoph, Lichterman 2003) - only to mention some of critical receptions. This paper will focus on the issue of the universality of binary cultural structure of civic and non-civic codes. It will be argued, that the basic cultural structure has relatively permanent character, which is not affected by the effects of historical events.

Narratives and ideologies stem from this binary structure or only temporarily seemingly overlie it (as in the period of the "real" Czech socialism, as the author claims). The basic binary code is understood as the structure of transcendent normative ideal, which could be empirically observed in breakthrough situations, when the binary code is explicitly used in the argumentation of actors, because this is the only way how to be included into the positive (civic) side of civil sphere for them. The question of the permanence of basic cultural structure and its relationship to what the author calls secondary cultural structure (narratives, ideologies) will be presented on a case of post-communist transition (for different interpretation see Skovajsa 2012). The author will also discuss the weaknesses of the approach she presents.

## b07RN29 - Social Theory and Islam I.

### Theology versus Non-Theology Student Values

Tugrul Keskin, Portland State University | [tugrulkeskin@pdx.edu](mailto:tugrulkeskin@pdx.edu)

Veysel - Bozkurt, Istanbul University | [veyselbozkurt@yahoo.com](mailto:veyselbozkurt@yahoo.com)

Values, an important component of culture, exemplify a way of life and thinking. They are abstract beliefs and ideas that influence the behaviors of people. All religions involve a system of values, and theology education teaches these values. Like other religious education, Islamic education emphasizes tradition, conformity, benevolence values; and not hedonism, self-direction, and stimulation.

It is hypothesized in this research that theology students would endorse characteristics of self-transcendence such as universalism and benevolence and conservative values such as conformity, tradition, and security more than students of other fields. As a result of capitalist globalization, values in the contemporary world have been reshaped and restructured to adapt to the context of market conditions. Our values

are accommodated and commodified within this economic environment, which is based on mass-consumption and mass-production. This dynamic has led to increased standardization of values in our daily lives. Values have become more unified. In this context, according to the theoretical foundations of secularism, religious observance should have played less of a role in a person's daily life when education and urbanization increase; however, this was not

the case in our social survey of Turkish university students. The aim of this paper is to investigate the priorities assigned to different social values and their degree of variance among theology and non-theology school students in a Turkish University. This paper is based on research drawn from the study of 304 undergraduate theology students, and 306 non-theology undergraduate students.

## British and American Muslim Artists Regarding Bourdieu's Field of Art

Yolanda van Tilborgh, Radboud University, Nijmegen | [tilborgh@xs4all.nl](mailto:tilborgh@xs4all.nl)

When a number of Muslims in non-Muslim majority countries in the West gained attention as upcoming performers in the genres of hip-hop, stand-up comedy and performing poetry in the last decade, this was perceived as a remarkable phenomenon by public media and social scientists. Firstly, manifold of these performers put Islam to the fore of their artistic expressions, whereas, secondly, the relation between art and Islam is perceived as troublesome on divergent social levels. While gaining visibility after the 2001 terrorist attacks, the phenomenon of entertaining Muslims is often understood as an expression of post-Islamism, the attitude of tolerance in Islamism that synthesizes contrasting opinions, for instance, by considering the performing arts as a repertoire to diffuse Islamic values. The phenomenon in which art merges with Islam into 'purposeful art' is also

presented as a completely unknown trend for which existing social perspectives are no longer valid. Social scientific models are even believed to be outdated when it comes to comprehend the complex manifestations of religion in modern day societies. The forthcoming paper examines if the perspectives of interactional and figurational sociology are indeed invalid to generate several significant understandings of Muslims, their practices and discourse regarding (popular) art. Do these artists share no conventions regarding professional ethics? Do all of them equally pursue purposefulness? Do they work predominantly in the field of religion and is religious capital leading? Or have they created an alternative field of art production where artists follow deviant conversion strategies to achieve their objectives?

## Arab Spring Revolution Affects on Domestic Violence

Rasha H Aly, University of Cincinnati | [alryrh@mail.uc.edu](mailto:alryrh@mail.uc.edu)

Although many Middle Easterners are excited about the Arab Spring Revolutions, the new governments may bring women a step backward rather than forward, in what Caprioli et al (2010) call a "post-war backlash against women." New laws regulate them into subordinate roles, possibly increasing their risk for domestic violence. In addition, a few of

these Arab revolutions exhibit characteristics of what Moghadam (1997) terms the "work-in-the-family" model of a revolution, a patriarchal model focusing on women's traditional roles. In contrast to this model, Moghadam (1997) also describes a modern, revolutionary model, where women gain more advantages. These theories help explain why Egyptian and Libyan

women experience obstacles in achieving progress in the newly forming governments, and how this might change or maintain the domestic violence landscape. For instance, Egyptians passed a new Constitution which discriminates more against women than the previous Constitution. Libya's likely adoption of a Sharia Constitution may make domestic violence against women more likely. This

paper examines three of the countries that were the sites of "Arab Spring" uprisings (Egypt, Libya, and Tunisia) with the aim of explaining why we might be witnessing backlash in Egypt and Libya, but not in Tunisia. By focusing on the issue of domestic violence rather than women's rights more generally, we can get a clearer picture about how domestic violence can be prevented in the Middle East.

## 08JS18JS29 - Social Theory and Media Sociology Today 2

Chair(s): George Pleios (University of Athens), Csaba Szalo (Masaryk University)

### Contagion Alert: A Sociological Approach to Epidemic Films

Julia Echeverria Domingo, University of Zaragoza | [juliaed@unizar.es](mailto:juliaed@unizar.es)

Several authors (Birkenstein et al 2010; Pollard 2011) have pointed to the profound stylistic and narrative changes that have taken place in what has been branded as post-9/11 cinema. One of these distinctive cinematic trends consists in a growing fascination with contagion narratives. Films like *Blindness* (Fernando Meirelles, 2008) and *Contagion* (Steven Soderbergh, 2011), together with a vast number of other narratives depicting highly infectious viruses that spread along character networks, have invaded movie theaters and TV screens alike in the last decade. In this paper I intend to foreground the need to analyze these films in a sociocultural context of ingrained fear and risk stimulated, among other events, by the War on Terror, the global financial crisis, and the dismantling of the welfare state. Media studies become somewhat limp for that

purpose and require the aid of broader sociological approaches that explain this everyday fixation with epidemiology through the social sciences. My intention is to make use of concepts such as Zygmunt Bauman's 'liquid modernity' and Ulrich Beck's 'risk society', and complement them with relational theories associated with the network society. Following Tony D. Sampson in his work *Virality* (2011), this has become the age of contagion, characterized by the flowing of affective infectious encounters that go beyond the biological understanding of pathogens. The final aim of this presentation is to demonstrate how film studies are enriched by the application of these sociological theories, which add a more contextual-conscious understanding of cinematic currents.

## Media and the Complexities of Everyday Life: Studying Reception with Practice Theory and Positioning Analysis

Triin Vihalemm, University of Tartu | [triin.vihalemm@ut.ee](mailto:triin.vihalemm@ut.ee)

Margit Keller, University of Tartu | [margit.keller@ut.ee](mailto:margit.keller@ut.ee)

This analysis contributes to discussions on the influence of mass media content, formats and genres on everyday activities. Proceeding from N. Couldry's (2004) view that media usage practices cannot be separated from other practices, we apply the practice theory approach (Schatzki 1996, Reckwitz 2002) to study the reception and utilization of media content by its consumers. We ask how mass media contributes to people becoming re-tooled and re-skilled when previously existing external structures organizing their everyday practices are changing significantly. The empirical data were gathered in Estonia in 2012-2013, when the country switched to the open electricity market and the principles of buying electricity changed. Our analysis is based on in-depth interviews with domestic clients and diaries in which they wrote reflections on what they were hearing, reading

and seeing about this topic. We explain how the interpretations of media content and our informants' discourse intertwine by highlighting the ways in which informants made sense of new tools (electricity packages and stock prices) and skills (asking for personal offers). We use positioning analysis (Harré & van Langenhove 1999) and outline the patterns of informants' self-positionings as (smart) practitioners trying to manage their budgets under the circumstances of the ultimate price-rise and information overload. Self-positionings are considered in comparison to other practitioners portrayed in the media, e.g. smart negotiators with competing suppliers or panicky pensioners afraid to remain without electricity beginning January 1st. Finally we discuss the methodological challenges of using practice theory and the positioning approach in reception research.

## Zombies, Contagion and the Limits to Capitalist Society – The Mystification of Reterritorialisation and Deterritorialisation in the Walking Dead

Isaac Gonzalez-Balletbó, Open University of Catalonia | [igonzelezbal@uoc.edu](mailto:igonzelezbal@uoc.edu)

Swen Seebach, Open University of Catalonia | [swen.seebach@gmail.com](mailto:swen.seebach@gmail.com)

Natàlia Cantó-Milà, Open University of Catalonia | [ncantom@uoc.edu](mailto:ncantom@uoc.edu)

This presentation wants to reflect on how media contribute to shape our imaginaries and perceptions of the world by presenting a reflection on the TV series – The Walking Dead. In his *Anti-Oedipus*, Deleuze describes capitalism as an interplay between desiring machines and the body without organs that is capital. In this interplay there are two forces engaging with each other, on the one hand desires pulling and pushing forward, on the other the territorial limits that hold back the

streams of desire, that break them back on a capitalist reality. If instead of Deleuze, we would use the terminology of Colin Campbell, we could also say that whilst on the one hand, we are demanded to engage with ever-new experiences to find out who we are, we never arrive at a concrete end (Campbell in Ekstrom/Brembeck). That cinema and TV contribute to shape our imaginaries of what is possible and impossible to us as much as our moral universes, is something that has been

explored by many authors doing film and media analysis (Couldry, Silverman, Mulvey and Denzin are just some examples). In fact, movies are part of our mythological structure, of a web from which we extract meaning for the weaving of our life. In our presentation, we want to reflect on one single myth, the myth of capitalism crystallized in the TV series the Walking Dead. The myth presents an

apocalyptic world after the crises wherein loyalty and faithfulness is the only answer, an alternative that however is constantly threatened by the deterritorialising forces, by the Walking Dead. The Walking Dead presented as a criticism to capitalism and to the de-emotionalisation of capitalist forces, contributes we will argue to the mystification of capitalism.

## **Netdoms, Switching, Style Concepts from Network Theory for Researching Communication Patterns – The Case of Scientific Communication**

**Marco Schmitt**, Georg-August University, Göttingen | [mschmit4@gwdg.de](mailto:mschmit4@gwdg.de)

Seeing communication patterns as networks has become something of a common-place. But new developments in network theory have yet to be brought in close contact with communication research. Harrison White is one of the central figures of the conceptual development of network research in sociology over the last 40 years. He has taken a turn from the former purely structural approach of network analysis to an approach encompassing more of the cultural and communicative aspects of social life. Three concepts are especially interesting for communication research: These are netdom, switching, and style. The netdom concept shares some similarities with the field concepts from Bourdieu or Lewin insofar it combines structural ordering with valuation ordering, but keeps the analytical distinction in using both

words. A netdom is a social space and a social process, where interactions condense into relations and rules. The concept of switching couples these social spaces in a communication process. Switching between netdoms is what happens in specific social encounters. A switch signifies a change of rules as well as a change of the relationships. Finally, the concept of style, born from the concept of structural equivalence, integrates such switches into profiles signifying an identity. Analysing the communication patterns of a research community as their switches between different netdoms concerning their research, makes it possible to define that community as a social entity. We will show how specific scientific production styles are discernible this way.

## a08RN29 - Poststructuralism and Sociology

### Reflexivity in contemporary society: a comparison between Giddens and Archer

Massimiliano Cervino, University of Salento | [massimiliano.cervino@unisalento.it](mailto:massimiliano.cervino@unisalento.it)

In what way the concept of reflexivity is correlated with crisis? My presentation tries to show how contemporary sociology considers the actor's answer to structural mechanism of loss of everyday security. I will try and stress how the theoretical approaches outlined by two of the main contemporary social theorists (Giddens and Archer) get to equivalent results, in spite of the background theoretical differences. The convergence between the two authors may be synthesized as follows: pluralism and security loss of contemporary society increase the everyday agent reflexivity. Giddens, within his structuration theory presents a stratification model of agent with particular attention to self-monitoring of action. Furthermore, in a number of essays (e.g. Identity and modern society) he stressed the importance of life politics with a particular

attention to reflexivity. Archer, on the other hand, devoted 20 years of her life to the study of structure and agency relation, coming eventually to recognize the significance of internal conversation of human being and the essential role of reflexivity as missing link between structural influence and human voluntarism. Although reflexivity may be understood as a typical character of modern individualism, as it stresses the fact that social actor has to think of himself as a unit and voluntarily plan his action (Parsons) my idea is that the theoretical approaches developed by Giddens and Archer, once critically compared, may be combined as to produce an extraordinary set of tools to understand present-day social individual actor in times of economical, political and cultural crises.

### Parrhesiatic Critique

Gallina Tasheva, University of Muenster | [gallina.tasheva@gmail.com](mailto:gallina.tasheva@gmail.com)

After arguing the varieties of well known forms of critique as Kant's radical transcendental critique, Hegel's immanent critique and Marx' objective critique as well Habermas' critique of communicative rationality the paper tends to show that in the late modernity the powerful form of critique is the courage for truth or the parrhesia in the sense of Foucault's critique of the assessments of values-systems. It is really the fact that Kant's transcendental critique is a kind of establishment of the Enlightenment, Hegel's and much more Marx' objective critique the establishment of the industrial

epoch and Habermas' critique of the communicative relationships the last attempt for salvation the reason of Enlightenment and the objective spirit of modernity. In the postmodern times of plurality of singular forms of being-with and economic globalisation and the excessive rise of asymmetrical social relations is the parrhesia or the singular initiation for saying the truth and doing all in the name of one's own truth even and just under danger and life-or-death struggle the only possible form of autonomous social critique and freedom.

## The Politics of the Performative and the Sociology of Resignification

Joao P Bachur, Free University of Berlin | [joapbachur@hotmail.com](mailto:joapbachur@hotmail.com)

One of the most insightful perspectives in current critical theory may be found in Judith Butler's politics of the performative. Relying on Derrida's reading of Austin, she claims that there is no sovereign speech act: since language is by definition citational, neither the context nor the subject's intention is capable of imposing the meaning of an utterance; only the chain of reiterated uses explains its success or failure. Thus, a term (e.g. "queer", "black", "women") may be critically deployed to break with its traditional usage, opening the possibility for subversive politics. Nonetheless, some critical remarks can be made: Butler's approach addresses mainly the spoken language, neglecting one of the main contentions of Derrida's reproach of phonocentrism. It overstates the role of the subject in the subversive appropriation of language, suggesting a fluidity in language

rarely found in practice, and it discloses a bias toward progressive resignification, as if conservative forces would not confront it on the same basis. The hereby-proposed paper suggests a sociological approach to these issues by focusing on the 'material' instances of resignification, extending the concept beyond identitarian politics and embedding it in collective writing practices: on societal level, resignification may express the continuous production of written documents and inscriptions, which work as "immutable mobiles" (Latour) and so can be put at work to mobilize collective engagement against conservative discourses, opening up the possibility of critique. Resignification assumes therefore the character of a struggle, in which conservative and progressive forces take part, and success depends on the capability of collective mobilization.

## a09RN29 - Pragmatic Sociology I.

### The Capacity of Critical Capacity: Boltanski's Lessons for a Fractured Postsocialist Society

Ivana Spasic, University of Belgrade | [ispasic@f.bg.ac.rs](mailto:ispasic@f.bg.ac.rs)

The paper aims at clarifying the notion of critique as elaborated by Luc Boltanski over the past twenty years, most notably in the recent work *De la critique* (2009). Boltanski's approach importantly includes the idea that critical capacity is shared and regularly deployed by ordinary social agents rather than being the privilege of the scholarly observer, as has often been assumed in various versions of critical theory. The paper will briefly trace the evolution of Boltanski's understanding of

critique and then focus on a key issue: how well does Boltanski's paradigm 'travel'? That is, how successfully can it be transposed to social context different from what was originally envisaged, i.e. the advanced Western societies? The perspective of Serbian society will be taken as an example of such a divergent social setting, to be used as a novel testing ground for Boltanski's theory with a view to shedding fresh light on both its strengths and limitations.

## Beyond Bourdieu: Towards a new theory of social practice

Gladius D. Kulothungan, University of East London | [g.kulothungan@uel.ac.uk](mailto:g.kulothungan@uel.ac.uk)

An internal reconstruction with a critical analysis of Bourdieu's theory of practice is presented. Deploying the relational logic that permeates his work (Vandenberghe, 1999), the article tries to systematically develop on Bourdieu's concepts of 'habitus', 'fields' and 'capitals'. Following on Vandenberghe, it posits that Bourdieu's epistemological assumptions and his sociological metascience are closer to Bhaskar's critical realism and that a 'critical constructionist' approach is immanent in his theorising. The article presents a new theory of social practice, building on Bourdieu's theory – with a critical constructionist approach. Based on empirical studies of three cases – two in the UK and one in Denmark – the article constructs a 'theory of domains', where a domain is argued to be an inclusive set of related 'fields' that Bourdieu outlined. A

'hierarchy of domains' idea is presented with the proposition that the 'economic domain' exerts an undue – and often unseen – influence on most of the other domains. Bourdieu's method, for this article, is taken to be an interpretation of social processes in flux and thus implies, a Bourdieusian approach would necessarily encourage one to move beyond him (Silva & Warde, 2010). In the true spirit of this understanding two new concepts are presented: 'habitis', as 'habitus writ large' – for collectives, organisations and institutions; and 'resource base' – as an ensemble of the different forms of capitals individuals and collectives possess and have access to. The article finally brings together these new concepts and the theory to construct a fresh 'theory of social practice', going beyond Bourdieu.

## The Idea of a "Pragmatic Sociology of Critique" – Reflections on Luc Boltanski's "On Critique"

Simon Susen, City University, London | [Simon.Susen@cantab.net](mailto:Simon.Susen@cantab.net)

The main purpose of this article is to provide an in-depth discussion of Luc Boltanski's "On Critique: A Sociology of Emancipation". On the basis of a detailed textual analysis of this book, the paper offers a fine-grained account of the strengths and weaknesses of Boltanski's "pragmatic sociology of critique". The study is divided into two parts. The first part examines five significant strengths of "On Critique": (1) its engagement with the normative tasks of critical theory; (2) its insights into the structuring function of institutions; (3) its emphasis on the justificatory role of critique; (4) its concern with the adaptable nature of domination; and (5) its insistence upon the empowering potential of emancipation.

Following the thematic structure of the previous investigation, the second part reflects upon the flaws and limitations of "On Critique": (1) its failure to provide solid normative foundations for critical theory; (2) its terminologically imprecise, analytically short-sighted, and insufficiently differentiated conception of institutions; (3) its unsystematic approach to the multi-layered relationship between ordinary and scientific forms of critique; (4) its lack of attention to the polycentric constitution of power relations in highly differentiated societies; and (5) its reductive understanding of human emancipation.

## b09RN29 - Social Theory and Islam II.

### Natural Law, Human Fallibility and the Transcendence of God: Islam, Christianity and Democracy

Mark Gould, Haverford College | [mgould@haverford.edu](mailto:mgould@haverford.edu)

I take seriously a contention found in the writings of Soroush and Sachedina, that the notions of right reason and human fallibility, when constitutive of the logic of religious commitment, and when that commitment is dominant in the values of a society, predispose that society towards democracy. While Soroush and Sachedina contend that these notions are present in Islam, I argue that they are found in a robust form in (some forms of) Christianity, but not in Islam. Beginning with the distinction between original sin and fitra (human's natural affinity for God) respectively, in Christianity and Islam, I explore how the notion natural law, when coupled with original sin, and thus the fallibility of our understanding, predisposes Christianity to be compatible with democracy. God, as conceptualized in Christianity, acts

justly, while the actions and expectations of God, as conceptualized in Islam, constitute what is just. The absence of a notion of natural justice, and the belief in man's natural affinity for God (fitra), and thus the ability to follow precepts laid down by God, predisposes a contradiction between Islam and a democracy that composes laws from the people (instead of through the sovereignty of God). While Roman Catholicism shares with certain strains of Protestantism the conceptualization of "natural law," because God is understood as immanent with the Church, the fallibility of humans derived from original sin is mitigated through the authority of the Church. In consequence, the relationship between Roman Catholicism and (the origins of) democracy is mitigated considerably.

### Methodological Approaches towards the Problem of Adaptation of Sunni Islam

David Hovhannisyan, Yerevan State University | [dhovhannisyan@ysu.am](mailto:dhovhannisyan@ysu.am)

Methodological approaches towards the problem of adaptation of Sunni Islam with modern civil norms and structures (J. Monnet) have shown, especially over the past decade, extremely important developments. The three main scenarios of adaptation are as follows: reforms proposed with the aim to adjust to the mainstream (Toynbee's Herodianism), isolation (Toynbee's Zealotism), and formulation of a new mainstream. The latter scenario is usually the hybrid of the first two. The proposed paper attempts to analyze approaches initiated by modern thinkers of Sunni Islam, as well as by state, religious, and social structures and organizations. These approaches can be grouped as follows: • Review the approaches towards the text of the holy book of Islam, the

Koran • Review the approaches towards the Hadith; this also includes critical analysis and transformation of the body of the Hadith • Combine the first two approaches and match the result with modern standards of protection of human rights • Transfer a number of Shariat-related problems, concerning the relations with other confessions, to international arena and make an attempt to solve them with the help of aqd as-sulh • Completely separate religion and the state. This approach produces the severe resistance of radicals, therefore its application is possible only in an authoritarian system of governance, which, in its turn, is unacceptable by the majority of religious scholars. The main question, however, should be formulated as

follows: What is Sunni Islam for modern Muslim scholars (Belief, Ideology or a globalization project)?.

## **The Doctrine of Sunnah and the Spirit of Capitalism: An alternative model to Weber's theory on the origins of modern capitalism**

Ryan S Coles, Brigham Young University | [r.coles0007@gmail.com](mailto:r.coles0007@gmail.com)

This article proposes an alternative model for Weber's theory on the origins of modern capitalism. Weber claimed that Calvinist doctrine was the source of a spirit of capitalism, which gave birth to modern capitalism. I argue that the spirit of capitalism was religiously rooted, but argue that the formative process of capitalism began long before Calvinism, with the spread of Islam. Muslims were religiously driven to follow the path of the Prophet Muhammad (BPUH), a path referred to as the Sunnah. Their emulation of the Prophet, a former merchant trader, pushed them to develop complex systems of commercial finance and to accumulate large sums of capital throughout the Islamic Empire. These three elements of capitalism (the spirit of capitalism, a developed finance system, and accumulation of capital) were brought to

Europe via the Crusades. Crusaders plundered accumulated capital from Islamic seaports, and returned to Europe with new finance ideas and a spirit of capitalism. Modern capitalism, therefore, was not wholly a Western creation. Rather it was the result of a long process that is rooted in the Islamic doctrine of Sunnah, and crowned with England's industrialization of the modes of production. I draw upon historical evidence and textual analysis in order to (1) define modern capitalism, (2) explain Weber's thesis on the origins of modern capitalism, (3) discuss the flaws of Weber's thesis, and (4) propose an alternative model on the origins of modern capitalism which shows that the Islamic doctrine of Sunnah was the source of the spirit of capitalism, and therefore, the long process that lead to the birth of modern capitalism in Europe.

## **a10RN29 - Pragmatic Sociology II.**

### **Imagined Crisis of Social Theory: the Shift from Representation to Performativity**

Victoria Dudina, St. Petersburg State University | [viktoria\\_dudina@mail.ru](mailto:viktoria_dudina@mail.ru)

In the context of complex and fluid character of modernity sociology does not have time to represent social reality. Every accurate representation is being blurred by rapidly changing referents. When we are talking about "crisis in sociology" we imply that sociological theories cannot adequately represent social reality. I shall argue that problem is not so much with theory, but with the epistemology of "representation". The sociological knowledge has changed but epistemological concepts are

still based on representational idiom which does not correspond to the dynamic nature of modern society. This report will discuss the process of replacing representational epistemic matrix by the performative one, which can be observed in the context of pragmatic turn in social sciences. From this point of view not only social reality has a character of performance, but social theory itself is being more and more performative. Performative social theory takes part in

enacting reality which it describes so it could not be evaluated in accordance with the representational criteria. In the framework of performative epistemology cognition is treated as practical activity implying such pragmatic strategies as recruiting, networking, creating alliances. Facts and observations are

considered as effects of agency. Scientific fact is not something that should be discovered, rather it is something that should be produced or performed. From this point of view the research process results not in accurate representation but in reconfiguration of reality.

## The Dialogic Turn of Sociology: Regaining Social Sciences Legitimacy in Europe

Ramon Flecha, University of Barcelona | [ramon.flecha@ub.edu](mailto:ramon.flecha@ub.edu)

Emilia Aiello, Autonomous University of Barcelona | [mariaemilia.aiello@uab.cat](mailto:mariaemilia.aiello@uab.cat)

The social utility of research in the Social Sciences and Humanities (SSH) has been one of the most discussed topics in the last years within the EU Framework Programme for Research and Innovation. Illustration of this was the extensive debate about the need or not of keeping SSH as an independent research programme within the European Commission's Horizon 2020 flagship initiative. This crisis and the related questioning of SSH research is mainly due to European citizens' scepticism about its ability to provide evidence-based solutions to overcome the current economic recession in Europe and the effects it is causing on people's everyday life. The INCLUD-ED (2006-2011) project –the only Integrated project about schooling and social cohesion in the area of SSH from the 6th EU Framework Programme–, has generated a dialogic way of

doing sociological theory that contributes to overcome this crisis and to regain social sciences' legitimacy. Drawing from theoretical contributions of authors such as Habermas, E. O. Wright or Burawoy and through the use of the Communicative Methodology, INCLUD-ED put the expert system in dialogue with the researched subjects, not only researching "on" the latter but also engaging them throughout the whole project. The result has been the creation of new knowledge necessary for the sociological comprehension –in the Weberian sense– of social inequalities and how to overcome them. The dialogic turn of sociology allows going beyond the old dichotomy between basic and applied research, enhancing both scientific excellence and the attainment of an utmost socio-political impact at different societal levels.

## Improvising Solutions: Theorising and Modelling Improvising Social Groups

Allan J Sutherland, Kyushu University of Nursing and Social Welfare | [allan.kyushu.ns.ac.jp@gmail.com](mailto:allan.kyushu.ns.ac.jp@gmail.com)

The improvising music ensemble, and improvisation are often considered to afford a social model for a) attaining harmonious social coordination within disparate social groups, and, b) stimulating and achieving higher capacities for problem solving, bringing creative, innovative transformation of social and/or technical practices. Bourdieu theorises improvisation emerging from the structured,

structuring habitus which generates both routine reproductive practices and regulated improvised responses to social disjuncture leading to innovative social transformation of structural relations. Social actors with a 'feel for the game', can transpose from one habitus to another and improvise novel practices and solutions, particularly in response to conditions of social disjuncture. Giddens, for

example, theorises social structural transformation consequent of improvised social action in opposition to the conditions for its occurrence. Becker investigates how unacquainted jazz musicians negotiate coordinated groups to improvise performances, reproducing the jazz artworld. This paper examines how group improvisation is practised, and can lead to creative solutions to specific social problems by modelling improvising ensembles as symbiotic

ensembles, with low, almost horizontal, levels of hierarchy with authority dispersed among synergistic members, rather than determined the sole capacity of leaders. Consequently, synergistic members are expected to be proactive, bring a rich studied and practised depth of pertinent knowledge, and skills, musical materials, refined through a personal biographical trajectory such that each member's contribution is distinctive, whose attained skills facilitate solo improvisation.

## On Critique of Capitalism that Finds itself Disarmed

Jerzy Stachowiak, University of Lodz | [jerzystachowiak@gmail.com](mailto:jerzystachowiak@gmail.com)

The paper focuses on the notion of the “new spirit of capitalism” as formulated and broadly discussed in the study of Luc Boltanski and Eve Chiapello (The New Spirit of Capitalism, 1999). At the time when the reflexive criticism towards capitalism was said to be neutralized, French authors described the mainstream regime of justification and traced back the origins of dominant managerial discourse. The basic assumption of the paper is that although the above mentioned book is not a novelty in theoretical landscape of social sciences, it is exactly it's stabilized and settled theoretical standing that allows disinterested view on the discursive and non-discursive changes of present times of crisis. On the one hand, the goal of the paper is to present the theoretical

strengths of The New Spirit of Capitalism as being capable of capturing the link between the realm of ideas and the realm of things. To do so, it considers the focal point of theoretical edifice which is the reciprocal affiliation between the types of critique of capitalism and the adaptation of capitalism to voices fighting against its premises. On the other hand, this paper challenges the thesis that what the “new spirit of capitalism” involves is only of economic or managerial relevance. It turns out, though, that commonly expressed view of an autonomous and creative subject, driven by the need of self-fulfillment has left the reference to managerial discourse blurred and obscure.

## b10RN29 - Social Theory and Theoretical Reflection

### The Becoming of the Complex Socrum: for a Humanistic Turn

Sergey Alexandrovich Kravchenko, Moscow State Institute of International Relations | [sociol7@yandex.ru](mailto:sociol7@yandex.ru)

According to P. Sztompka, modern world is in a state of becoming of the complex socrum that occurs in the context of related social traumas that lead to the ambivalences, clashes within a

culture. I argue for a ‘humanistic turn’ in sociology that implies both a non-linear and humanistic sociological imagination, and humanistic praxis. My starting premise lies in

the fact that the non-linear humanistic sociological imagination should in principle be based on the adequate and deeper understanding of ambivalent realities of the complex socium. All the existing types of sociological imagination worked out by C. Wright Mills, P. Szotompka, S. Fuller, U. Beck and other scholars are very significant, because they efficiently reflect the important aspects of increasingly complex socium. But all of them lack the problem of humanistic orientation of the agency. In the most general way, the non-linear humanistic sociological imagination can be defined as follows. It deals with the acceleration of socio-cultural dynamics and glocal complexity, the integrity of

the interdependent humanity, synergetically takes into consideration paradoxical synthesis, breaks, risks, and dispersions of socium, its objective, subjectively constructed, and virtual realities, searching for new forms of humanism, based on men's existential needs. By humanistic praxis I understand the humane creative activity the main aim of which is to preserve the human capital of all the generations and to maintain the balance between scientific innovations and key environmental processes. The notion 'tremendous knowledge' should be rediscovered: it should mean not much knowledge.

## Fluid Politics of Community: A Conceptual and Theoretical Reflection

Gürçan Koçan, Istanbul Technical University | [kocan@itu.edu.tr](mailto:kocan@itu.edu.tr)

Ahmet Fazıl Öncü, Sabancı University | [aoncu@sabanciuniv.edu.tr](mailto:aoncu@sabanciuniv.edu.tr)

Societal and communal forms of 'sociation', to use Simmel's terminology, can be considered two distinct frames of social interaction resting on two different modes of loyalty and trust. As such, they both are embedded in the lifeworlds of almost all 'modern' societies around the globe. Although these two usually overlap and supplement each other, they may sometimes come into conflict. The latter has been globally on the rise in recent decades to become a disruptive social and political matter - particularly in those societies where ascribed dimensions of identity (such as ethnic, linguistic, religious or even ideological - if one's ideology is a family tradition, for example) are more operational in mediating and governing interactions among individuals and institutions than achieved dimensions of identity. In this paper, first, we critically review the divergent manners through which the

concept of community has been elaborated by some of the leading classical and cotemporary theorists. After discerning that there are contradictory theoretical orientations regarding the concept of community in relation to the concept of society, in the second part, we focus on contemporary communal forms of sociation as they appear in such realms as education, business, media and politics. In the last part, in connection with Bauman's conceptualization of liquid modernity, we offer our comprehension as to why community operates against society and its cohesiveness by weakening loyalty and trust among individuals of a society. In concluding, we suggest seeing 'community' as a decisive ground of social conflict in the structuring of friend/enemy relations, i.e. the political of politics, of our epoch.

## The Theoretical Problem of Collective Action in Contemporary Societies: the Relevance of Inequality

Nuno Nunes, ISCTE-IUL, Lisbon | [nuno.nunes@iscte.pt](mailto:nuno.nunes@iscte.pt)

The current phase of western modernity, characterized by economic and political crises that express contradictions in the functioning and the quality of democracies, requires greater understanding of the theoretical connections between the problematic of collective action and social inequality, questioning the dominant theories of collective action and that will also serve to enrich the central theoretical debates in contemporary sociology. It is presented a theoretical program of holistic analysis of collective action, departing from the multidimensional space of inequality and its social consequences, applied and tested in recent empirical research that took Europe as an object of study. Defining as axes of problematization the concepts of structural positions, agency, interaction and social change, it is discussed the structural,

cultural, organizational and institutional properties of individuals and collective actors, the constitution of collective action in the everyday life-spheres of agents, and the directions of the processes of social change from a structure-actor-system perspective. The sociological research developed allowed us to achieve the following scientific theoretical knowledge: that an unequal distribution of the causal powers of agents, regarding economic, cultural, social and symbolic resources, reflects on the intensity of their practices of collective action and on the adherence of the main collective actors of western modernity; and that the link between structural positions and cultural systems is fundamental to understand the relationship between social inequality and collective action in contemporary societies.

## Locating Financialisation

Emrah Karakilic, Goldsmith, University of London | [ekarakilic@gmail.com](mailto:ekarakilic@gmail.com)

On 8th of October 2012, British Sociological Association (BSA) organised a presidential seminar on the financial crisis with Andrew Brown of FESSUD (Financialisation, Economy, Society and Sustainable Development) whose introductory talk was directed towards the critique of mainstream orthodoxy of neo-classical economics in its failure to foresee and react financial crisis and thus a call for social scientists to bring together distinct frameworks in order to grasp the nature of contemporary capitalism, which is characterized by the process of financialisation. As a response, my presentation will argue that the process of

financialisation should be thought at macro, meso and micro levels, where each level of analysis, in general, was provided by different schools of thought. In this regard, the presentation offers a constructive dialogue among three theoretical frameworks on financialisation; that is, Marxist Economics (macro), Critical Social Accountancy Approach of Manchester Business School (meso), and Social Studies of Finance of University of Edinburgh (micro). I argue that greater engagement among the literatures would provide new fruitful avenues of research on financialisation.

## c10RN29 - Social Theory and Critique

### The Stances of Social Theory Today and Their Capacity to Meaningfully Conceptualise our Present

Carlos Frade, University of Salford (Manchester) | [c.frade@salford.ac.uk](mailto:c.frade@salford.ac.uk)

Taking to heart the ESA 2013 Conference Call's suggestion that in order to understand the current crisis "European sociology has to rely on rediscovering its subject matter as being more than a technical order", this paper seeks to explore the conditions for a renewal of social theory, and more generally of sociology and the social sciences. In order to that, the paper advocates an immanent perspective on the 'crisis' whereby social theory and sociology are not placed in some external site, one somehow untainted by the current world from where they would critically analyse the 'crisis'. Rather, the paper claims that the current 'crisis' is also a 'crisis' of sociology and the social sciences, and that both 'crises' are so strongly intertwined that no credible attempt to grasp the contemporary situation can be made in absence of an approach that recognises such

profound affinities between the situation of both the social sciences and the world we live in. In developing this perspective, the paper suggests that social theory and sociology today are much more a reflection of the current world, and therefore of its 'crisis', than a determined attempt to think such world through, and that no impulse to renew the social sciences can be born or be successful in absence of a much wider impulse, ultimately political, to transform the current world. The main, although not the only, criterion used to support this analysis will be 'subjectivation' (this includes the calling or vocation, desire, what is ultimately attempted, etc.) as opposed to mere adaptation to the world. The theorisations of this problem in social theory, which goes beyond the question of agency as normally understood, will also be advocated.

### The Academic Mode of Production and the Financial Crisis

Josh Booth, University of Cambridge | [jnwb2@cam.ac.uk](mailto:jnwb2@cam.ac.uk)

When British journalist Aditya Chakraborty wrote an article lamenting sociologists' inadequate analysis of the financial crisis (2012), he was probably unaware that he was confronting one crisis with another. The responses he received revealed profound unease within the discipline about its relevance in the face of the major problems that afflict our world. Was this a crisis of empirical sociology (see Savage 2007)? One social theorist who has addressed the problems resulting from the financial crisis is Luc Boltanski. Boltanski (2011) seeks to reconcile the sociology of critique with critical sociology, producing an account of domination that can help us understand some of the fallout from

the financial crisis. I argue that, joined with work in the sociology of finance (particularly MacKenzie and Millo 2003), Boltanski's contribution can also help us understand the causes of the financial crisis - but to do this we need to shift our focus away from Boltanski's preoccupation with rule-breaking and towards a concern with institution-building, asking who has the resources to set the rules according to which our institutions operate. Doing so requires us to reflect on our own practices as academics: how do they help distribute the resources for institution-building? Drawing on critiques of academic knowledge-production from within academia (Foucault 1980, Bourdieu 2000, Latour 2005), I suggest that the very form

in which academic work is produced, quite apart from its content, may contribute to the kind of circumstances that precipitated the financial crisis. To scrutinise this form of

production requires us to launch a critique of academia itself - and of the way in which academic production is changing.

## Sociology in Times of Crisis: Three Forms of Critique

Frank Welz, Innsbruck University | [frank.welz@uibk.ac.at](mailto:frank.welz@uibk.ac.at)

›Crisis‹ is signalling a state that could be different. Since late 2008 societies have been interpreted as stuck in a state in which “the old is dying and the new cannot be born” (Gramsci). It has not been clear from the beginning whether the ongoing turbulences should be considered as a financial crisis of the economy (early interpretation), a debt crisis of the state (present understanding) or a social crisis of an unequal society (Stiglitz). While neither economics nor sociology had foreseen the upheavals, the current experiences partly push sociology back to its roots, opposing the enormous fragmentation of the social sciences, in making us aware of societies as contingent phenomena of macro historical change. My paper discusses three distinct social scientific conceptual proposals that critically emphasize the contingency of the social, the fact that things could be different, in
